PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entry No. in PA ↓ **Title of paper** ↓

87093 PAC study of molecular rotational motions in dilute solutions.
Authors → A.Baudry, P.Boyer, J.D.Fabris, P.Vulliet (Lab. d'Interactions Hyperfines, CENG, Grenoble, France). ← **Author's affiliation**
Source of paper → *Hyperfine Interactions (Netherlands)*, vol.10, no.1-4, p.1057-62 (June 1981). (Proceedings of the Fifth International Conference on Hyperfine Interactions, Berlin, Germany, 21-25 July 1980).
The rotational tumbling of neutral chelates of hafnium dissolved in several organic solvents was studied via ^{181}Ta DPAC experiments. The results are compared with the predictions of a hydrodynamic model with partial slip boundary conditions. The influence of solute-solvent interactions and/or associations on the quadrupole relaxation is discussed. (16 refs.) } **Abstract**

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

Physics Abstracts

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

7510 General theory and models of magnetic ordering 5429
7510D *Crystal-field theory and spin Hamiltonians* 5429
7510H *Ising and other classical spin models* 5429

page
7510J *Heisenberg and other quantized localized spin models* 5429
7510L *Band and itinerant models* 5430
7520 Diamagnetism and paramagnetism 5430
7520C *Nonmetals* 5430
7520E *Metals and alloys* 5430
7520H *Local moment in dilute alloys; Kondo effect* 5431
7525 Spin arrangements in magnetically ordered materials (neutron studies, etc) 5431
7530 Magnetically ordered materials, other intrinsic properties 5431
7530C *Saturation moments and magnetic susceptibility* 5431
7530D *Spin waves* 5432
7530E *Exchange and superexchange interactions* 5432
7530G *Anisotropy* 5433
7530H *Magnetic impurity interactions* 5433
7530K *Magnetic phase boundaries* 5433
7530S *Magnetocaloric effect* —
7540 Critical-point effects, specific heats, short-range order 5434
7540D *Ising and other classical spin models* 5435
7540F *Heisenberg and other quantized spin models* 5435
7550 Studies of specific magnetic materials 5435
7550B *Ferromagnetism of Fe and its alloys* 5435
7550C *Ferromagnetism of other metals* 5436
7550D *Ferromagnetism of nonmetals* 5436
7550E *Antiferromagnetics* 5436
7550G *Ferrimagnetics* 5436
7550K *Amorphous magnetic materials* 5436
7550M *Magnetic liquids* —
7560 Domain effects, magnetization curves, and hysteresis 5436
7560C *Domain walls and domain structure* 5437
7560E *Magnetization curves, hysteresis, Barkhausen and related effects* 5437
7560G *High coercivity materials* —
7560J *Fine-particle systems* 5438
7560L *Magnetic aftereffects* 5438
7560N *Magnetic annealing and temperature-hysteresis effects* —
7570 Magnetic films and plates 5438
7570K *Domain structure (magnetic bubbles)* 5439
7580 Magnetomechanical and magnetoelectric effects, magnetostriction 5439
7590 Other topics in magnetic properties and materials 5439

7600 MAGNETIC RESONANCES AND RELAXATION IN CONDENSED MATTER; MÖSSBAUER EFFECT 5440
7620 General theory of resonances and relaxation 5440
7630 Electron paramagnetic resonance and relaxation 5440
7630D *Ions and impurities: general* 5440
7630F *Iron group (3d) ions and impurities (Ti-Cu)* 5440
7630H *Platinum and palladium group (4d and 5d) ions and impurities (Zr-Ag and Hf-Au)* 5441
7630K *Rare-earth ions and impurities* 5441
7630L *Other ions and impurities* 5441
7630M *Colour centres and other defects* 5441
7630P *Conduction electrons* 5442
7630R *Free radicals* 5442
7640 Diamagnetic and cyclotron resonances 5442
7650 Ferromagnetic, antiferromagnetic, and ferrimagnetic resonances; spin wave resonance 5443
7660 Nuclear magnetic resonance and relaxation 5443
7660C *Chemical and Knight shifts* 5444
7660E *Relaxation effects* 5445
7660G *Quadrupole resonance* 5445
7660L *Spin echoes* 5445
7670 Magnetic double resonances and cross effects 5446
7670D *Electron-nuclear double resonance (ENDOR)* 5446
7670E *Dynamical nuclear polarization* —
7670F *Double nuclear magnetic resonance (DNMR)* 5446
7670H *Optical double magnetic resonance (ODMR)* 5447
7670K *Electron double resonance (ELDOR)* —
7680 Mössbauer effect; other gamma-ray spectroscopy 5447
7690 Other topics in magnetic resonances and relaxation 5448

7700 DIELECTRIC PROPERTIES AND MATERIALS 5448
7720 Permittivity 5448
7730 Polarization and depolarization effects 5449
7740 Dielectric loss and relaxation 5449
7750 Dielectric breakdown and space-charge effects 5449
7755 Dielectric thin films 5450
7760 Piezoelectricity and electrostriction 5450
7770 Pyroelectric and electrocaloric effects 5450
7780 Ferroelectricity and antiferroelectricity 5450
7780B *Transitions and Curie point* 5450
7780D *Domain structure and effects; hysteresis* 5451
7785 Electrical resonances 5451
7790 Other topics in dielectric properties and materials —

7800 OPTICAL PROPERTIES AND CONDENSED MATTER SPECTROSCOPY AND OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION 5451
7820 Optical properties and materials 5451
7820B *General theory (for pure homogeneous materials)* 5451

page
7820D *Optical constants and parameters* 5451
7820E *Optical rotatory power* 5453
7820F *Birefringence* 5453
7820H *Piezo-, elasto- and acousto-optical effects* 5453
7820J *Electro-optical effects* 5454
7820L *Magneto-optical effects* 5454
7820N *Thermo-optical effects* —
7830 Infrared and Raman spectra and scattering 5455
7835 Brillouin and Rayleigh scattering 5459
7840 Visible and ultraviolet spectra 5460
7845 Stimulated emission 5461
7850 Impurity and defect absorption in solids 5461
7855 Photoluminescence 5463
7860 Other luminescence spectra and radiative recombination 5466
7860F *Electroluminescence* 5466
7860H *Cathodoluminescence, ionoluminescence* 5466
7860K *Thermoluminescence* 5466
7860M *Sonoluminescence, triboluminescence* 5466
7860P *Chemiluminescence* 5466
7865 Optical properties of thin films 5466
7870 Other interactions of matter with particles and radiation 5468
7870B *Positron annihilation* 5468
7870C *X-ray scattering* 5468
7870D *X-ray absorption and absorption edges* 5468
7870E *X-ray emission threshold and fluorescence* 5469
7870G *Microwave and radiofrequency interactions* 5469
7890 Other topics in optical properties of condensed matter and other interactions of matter with particles and radiation —

7900 ELECTRON AND ION EMISSION BY LIQUIDS AND SOLIDS; IMPACT PHENOMENA 5469
7920 Impact phenomena 5469
7920D *Laser-light impact phenomena* 5469
7920F *Electron impact: Auger emission* 5469
7920H *Electron impact: secondary emission* 5469
7920K *Other electron impact phenomena* 5469
7920N *Atom, molecule, and ion impact* 5470
7920R *Atomic and molecular beam interactions* 5471
7940 Thermionic emission 5471
7960 Photoemission and photoelectron spectra 5471
7970 Field emission and field ionization —
7975 Exoelectron emission —
7980 Resonance tunnelling —
7990 Other topics in emission and impact phenomena in condensed matter —

8000 **CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY** 5473

8100 MATERIALS SCIENCE 5473
8110 Methods of crystal growth and purification 5473
8110B *Growth from vapour* 5473
8110D *Growth from solutions* 5473
8110F *Growth from melts* 5473
8110H *Zone melting and zone refining* —

SUBSIDIARY INDEXES

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

Classification
A mesons 1440
Ab initio calculations 3120
Aberrations 4180, 4230, 4278
Abrasion 4630P, 6220P, 8140P
Absorptive models 1240P
Acceleration measurement 0630G
Accumulation layers 7320, 7340Q
Acoustic devices 4385
Acoustic holography 4363
Acoustic noise 4350, 4360, 4388, 8670J
Acoustic nuclear magnetic resonance 7660
Acoustic paramagnetic resonance 7630
Acoustic properties of gases 5140
Acoustic properties of liquids 6260
Acoustic properties of solids 6265
Acoustic signal processing 4360
Acoustic wave propagation 4320, 4325, 5140, 6260, 6265
Acoustics 43
Acousto-optical effects 5140, 5170, 7820H
Acoustoelectric effects 4388, 5140, 5150, 7250
Adaptive optics 42
Adherence 4630P
Adhesion 4630P, 6825, 8190
Adsorption 6845, 8265
Aerodynamics 4740
Aeroelasticity 4630C, 4630M
Aeronomy 94
Aerosols 4755K, 8270, 92
Aerospace 9480, 9555
Aerospace biophysics 8765
Ageing 8140G
Airglow 9410Q
Algebra 0210
Alpha decay 2360
Alpha particle-nucleus reactions 2560
Alpha particle-nucleus scattering 2560
Alpha particle spectroscopy 2930
Alpha particles 2140, 2710
Amorphous semiconductors 6140, 7125M, 7220, 7280N
Amorphous state 6140, 81
Anderson model 7110, 7125M, 7155
Anelasticity 4630J, 6240, 8140J
Anemometers 4780, 9385
Angular measurement 0630C
Annealing 8140E, 8140G
Anodisation 8160, 8245
Antiferrimagnetism 7530
Antiferroelectric materials 7780
Antiferromagnetic properties of substances 75, 7550E
Antiferromagnetic resonance 7650
Antiphase boundaries 81
Antiphase domains 81
Antireflection coatings 4270, 4278H, 4280
Appearance potential spectroscopy 0785, 7870E

64572 5th High Energy Spin Symposium.
AIP Conf. Proc. (USA), no.95 (1982). [received: April 1983]
Conference held at: Westhampton Beach, NY, USA. Date Sept. 1982. The following topics were dealt with: spin; Thomas precessional frequency; particle magnetic moments; inclusive polarisation; exclusive polarisation; parity violation; T violation; resonances; dibaryons; phase shifts; deep inelastic scattering; quark models; QCD; polarised beams; polarised proton acceleration; polarised targets; polarised particle sources; polarimeters. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64573 XIII Congress of Theoretical Chemists of Latin Expression.
THEOCHEM (Netherlands), vol.10 (May 1983).
Conference held at: Alghero, Sardinia. Date 5-8 Oct. 1982. The following topics were dealt with: Time dependent Hartree Fock theory; local defects in crystals; atomic collisions; molecular electrostatic potential; chemical bonding; chemical reactivity; conformational analysis; nuclear electric shielding, coupled oscillators; dissociation reactions; molecular properties in liquid phase; quantum state to state reactive probabilities; circular dichroism; CNDO/S calculations of resonance Raman spectra; photodissociation and predissociation in strong electromagnetic field.

64574 Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys.
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.4 (1982). [received: May 1983]
Conference held at: Asha, USSR. Date 15-17 Sept. 1981. The following topics were dealt with: electrical engineering steels; electromagnetic losses; magnetic properties; recrystallisation texture; domain structure; Fe-Si alloys. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64575 Second International Symposium on Integrated Global Monitoring of Environmental Pollution.
Environ. Monit. & Assess. (Netherlands), vol.2, no.4 (1982).
Conference held at: Tbilisi, USSR. Date Oct. 1981. The following topics were dealt with: biosphere state forecasting and global state monitoring, environmental pollution of Europe and Asia (Eurasian continent), eutrophication by microbial uptake kinetics of dissolved organic matter, Lake Baikal, biological indicators and dispersion models in air pollution monitoring, pollutant transport, world ocean monitoring ecological principles and SO_2 detection using scotch needles.

64576 Meeting on Electrochemical Techniques in Corrosion Testing and Research.
Corros. Sci. (GB), vol.23, no.4 (1983).
Conference held at: Manchester, England. Date 4-6 Jan. 1982. The following topics were dealt with: impedance measurements; coated steel corrosion; stress corrosion cracking of stainless steels; intergranular corrosion susceptibility; depassivation of iron. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64577 105th Meeting of the Acoustical Society of America (papers in summary form only received).
J. Acoust. Soc. Am. (USA), vol.73, suppl.1 (Spring 1983).
Conference held at: Cincinnati, OH, USA. Date 9-13 May 1983. The following topics were dealt with: architectural acoustics; physiological acoustics; psychological acoustics; directional hearing; speech communication; noise; shock and vibration; physical acoustics; underwater acoustics; engineering acoustics; education in acoustics; and musical acoustics.

64578 Sixth Annual Conference of the American Society of Biomechanics (papers in summmary form only received).
J. Biomech. (GB), vol.16, no.4 (1983).
Conference held at: Seattle, WA, USA. Date 13-15 Oct. 1982. The topics dealt with included: motor performance and jet propulsion in Nautilus pompilius; the pressure and flow patterns inside an aortic bifurcation; the effects of smooth muscle activity on the mechanical and hydraulic properties of the dog aorta; evaluation of trunk deformity using light profiles; CT obtained bone geometry and density measurements using 2nd order correction; biomechanics of the knee extension exercise; torsion in ostrich knees; true stress and strain in mammalian skeletal muscle, comparative mechanics of mammalian spines; elastic energy storage and power output in squid mantle muscle; mechanics of orientation in sea pens; mechanical properties of cephalopod arteries. 65 papers were presented.

64579 Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces.
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3 (March 1983).
Conference held at: Yokohama, Japan. Date 13-16 Sept. 1982. The following topics were dealt with: electronic states; surface properties; transport phenomena; magnetism of thin films with artificial super structures; fine particles; Mossbauer spectroscopy; magnetoacoustic and elastic properties; magneto-optics; amorphous films; domains; structure and anisotropy; ion implanted films; experimental techniques. 102 papers are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64580 Physics of Non Crystalline Solids. Proceedings of the 5th International Conference.
J. Phys. Colloq. (France), vol.43, no.C-9 (Dec. 1982). [received: April 1983]
Conference held at: Montpellier, France. Date 5-9 July 1982. Sponsors: Int. Comm. Glass; Societe Francaise de Physique. The following topics were dealt with: structure; glass formation and devitrification; optical properties; transport properties; phonons and thermal properties; mechanical properties and surfaces; magnetic properties. 138 papers were presented, of which 136 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64581 45th Annual Meeting of the Meteoritical Society (papers in summary form only received).
Meteoritics (USA), vol.17, no.4 (1982).
Conference held at: St. Louis, MO, USA. Date 13-16 Sept. 1982. The following topics were dealt with: fluid inclusions, Fe meteorites, Solar System abundances, nuclear tracks, noble gases, breccias, Antarctic meteorites, cosmic ray tracks, chondrites, compositions, parent bodies, stony meteorites, asteroids, tektites, achondrites, lunar rocks and bulk analysis.

64582 Proceedings of the Conference on Nonlinear Fluid Behavior.
Physica A (Netherlands), vol.118A, no.1-3 (March 1983).
Conference held at: Boulder, CO, USA. Date 7-11 June 1982. The following topics were dealt with: non-Newtonian behaviour of polymeric liquids; kinetic theory of non-equilibrium fluids; molecular dynamics simulations of the rheological properties of simple fluids; Brownian motion effect on the transport of properties of a suspension of spherical particles; computer simulation; light scattering; continuum theory; turbulence; higher order equations of hydrodynamics; steady state thermodynamics and spatial correlations; fast pressure quenches near the critical point of a binary liquid mixture; a solvable weak-potential model of a non-Newtonian fluid; long time tail conundrum in non-equilibrium statistical mechanics; and catastrophic changes in tagged particle dynamics by the self-consistent repeated ring equation. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64583 Symposium on Probing the Earth's Lithosphere by Controlled Source Seismology.
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4 (April 1983).
Conference held at: London, Ont., Canada. Date 22-23 July 1981. The subject matter of the papers was divided into three broad headings: (1) continental lithosphere, (2) deep seismic reflection studies, and (3) lithosphere of oceanic regions and margins. In the session on the continental lithosphere, the results of a number of medium- to long-range refraction experiments carried out in North America, Europe, Asia and Africa were presented. It also included papers in which interpretational techniques were discussed. In the session on deep seismic reflection studies the results of both Vibroseis- and explosion-type reflection experiments were described in detail, with emphasis on the identification of detailed lateral variations in structure across various regions of geological interest. A series of papers was presented in the session on the lithosphere of oceanic regions and margins including structures such as the East Pacific Rise, the Azores-Biscay Rise, subduction zones of South America and New Zealand, as well as studies of the lower lithosphere in the north western Pacific Ocean. This special issue of Physics of the Earth and Planetary Interiors presents ten selected papers. 29 papers were presented, of which 10 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this and other issues.

64584 Fifth International Symposium on Solar-Terrestrial Physics.
Space Sci. Rev. (Netherlands), vol.34, no.1 (Jan. 1983).
Conference held at: Ottawa, Canada. Date 17-22 May 1982. Sponsors: COSPAR; IAU; IUGG; et al. Several solar topics were discussed, including: solar coronal disturbances, the solar cycle, electrodynamics of the outer solar atmosphere, preflare magnetic fields. Other papers describe the solar wind, interplanetary disturbances, interplanetary cosmic ray propagation and solar wind shock waves. Some of the papers describe the interaction of the solar wind with the Earth's magnetosphere. Another group of papers decribe magnetospheric topics. Magnetosphere-ionosphere interactions are described. The last section of the conference is about the neutral atmosphere. 31 papers were presented and are published in full. Abstracts of individual papers can be found under the relevant classification in this and other issues.

64585 Conference on the Processes of Planetary Rifting.
Tectonophysics (Netherlands), vol.94, no.1-4 (1983).
Conference held at: St. Helena, CA, USA. Date 3-5 Dec. 1981. Sponsors: American Geophys. Union; Lunar & Planetary Inst.; NASA; NSF. The following topics were dealt with: Graben formation, rifts, swells, uplift, lithosphere convective thinning, volcanism, Earth, Venus, Mars, mid-ocean ridges, hotspot tracks, cratonic basins, pulsation tectonics, continental margin breakup, gravity, Africa, heat flow, Kenya, magnetotelluric results, crust structure, United States, seismic refraction, geochemistry, orogeny, stress, surface deformation and geothermal resources.

64586 Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium).
Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale (1982), 2 vol. xxiv+1043+xv+415 pp.
Conference held at: Toulouse, France. Date 13-17 Sept. 1982. The following topics were dealt with: microwave, visible and IR data enhancement and thematic classification, spectral signatures of objects, renewable resources,. nonrenewable resources, environmental monitoring, oceanography and coastal zone, ice and snow cover, land use and cover, engineering projects remote sensing, industrial processes, vegetation damage, agriculture, forestry and satellite remote sensing programs.

64587 Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region.
Lund, Sweden: Univ. Lund (1982), 2 vol. 281 pp.
Conference held at: Lund, Sweden. Date 5-7 Oct. 1982. The goal of the workshop was to discuss how the new generation of electron accelerator systems and rings with high current and high duty-cycle can be used to improve our understanding of nuclear structure and nuclear reactions and what demands this new experimental situation puts on targets and detectors. The main topics were: (i) stretcher rings and related experiments; (ii) storage rings and related experiments; and (iii) intermediate energy physics. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64588 8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems.
Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart (1982), 516 pp.
Conference held at: Stuttgart, Germany. Date 14-15 Oct. 1982. The following topics were dealt with: structural mechanics, fracture and fatigue nondestructive testing in materials for LWR and advanced reactor systems.

64589 Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics.
LaGrange Park, IL, USA: ANS (1982), xiv+1525 pp. [0 89448 110 X]
Conference held at: Santa Barbara, CA, USA. Date 11-14 Jan. 1983. Sponsors: ANS; ASME; AIChE. The following topics were dealt with: two-phase hydrodynamics, heat transfer aspects of nuclear thermal-hydraulics, mathematical methods in nuclear thermal-hydraulics, simulators and analysis of reactor transients, loss of coolant accidents, fluid-structure interaction, natural circulation in water and gas cooled reactors, thermal hydraulics of degraded cores, behaviour of containment systems, hydrogen behaviour in containment, thermal hydraulics of LMFBRs, reactor instrumentation. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64590 Nordisk Isolationssymposium. Nord-IS 82 (Nordic Insulation Symposium. Nord-IS 82).
Stockholm, Sweden: ASEA (1982), 274 pp.
Conference held at: Odense, Denmark. Date 1982. The following topics were dealt with: electric discharges at insulation interfaces; microscopic phenomena at interfaces; high-voltage tracking; materials testing; partial discharges; high-voltage technology and insulation coordination. 24 papers were presented, and are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64591 Proceedings of the 21st Annual Conference of the Electron Microscopy Society of Southern Africa.
Johannesburg, South Africa: Electron Microscopy Soc. Southern Africa (1982), vii+116 pp. [0 620 01543 8]
Conference held at: Grahamstown, South Africa. Date 1-3 Dec. 1982. The following topics were dealt with: techniques and instrumentation in scanning and transmission electron microscopy; the application of electron microscopy to biological and medical sciences, electron microscopy applications in solid state physics.

64592 In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV).
North-Holland: New York, USA (1982), xii+343 pp. [0 444 00726 1]
Conference held at: Boston, MA, USA. Date 16-19 Nov. 1981. The following topics were dealt with: high temperature structural eutectic alloys; eutectic superalloys; mechanical properties; directionally solidified composites; microstructure. 30 papers were presented, of which 28 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64593 Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste.
New York, USA: North-Holland (1982), xiv+905 pp. [0 444 00725 3]
Conference held at: Berlin, Germany. Date 7-10 June 1982. The following topics were dealt with: nuclear waste management; high level radioactive waste forms; glass reactions with aqueous media; glass mechanical properties; ceramics; waste repository characterisation; salt repositories; rock repositories; backfill materials; canister corrosion; nuclide migration in geosphere; LLW in-situ solidification; MLW in-situ solidification. 98 papers were presented, 91 of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64594 Workshop on SPS Fixed-Target Physics in the Years 1984-1989 (CERN-83-02).
Geneva, Switzerland: CERN (1983), vii+192 pp.
Conference held at: Geneva, Switzerland. Date 6-10 Dec. 1982. A Workshop on SPS Fixed Target Physics in the Years 1984-89 was held at CERN during the week 6-10 December 1982 and was attended by more than 400 physicists. The introductory remarks by H. Schopper, Director-General of CERN, together with the contributions of K. Stanfield and T. Yamanouchi on the FNAL scientific programme and plans, and with the summary talks of the conveners of the five sessions related to the main topics of the Workshop, are contained in this first volume of the Proceedings. An attempt has been made to include the discussion contributions for the concluding day of the Workshop.

64595 Proceedings: Thermal Reactor Benchmark Calculations, Techniques, Results, and Applications (EPRI-NP-2855) (papers in summary form only received).
Palo Alto, CA, USA: EPRI (1983), 696 pp.
Conference held at: Upton, NJ, USA. Date 17-18 May 1982. This report contains the proceedings of an EPRI-sponsored symposium held on May 17-18, 1982, at the Brookhaven National Laboratory in New York, to discuss thermal reactor benchmark calculations, techniques, results, and applications. Third in a series of workshops on problems associated with nuclear data use and confirmation of LWR analysis, this conference addressed the concern about nuclear data and methods that have been used for analyzing or predicting reactor behavior. Areas where measurements have been productive and where additional improvements can be made are studied.

64596 Colloquium on 'Saw Devices'.
London, England: IEE (1983), 58 pp.
Conference held at: London, England. Date 23 Feb. 1983. Outlines the theory and practical aspects of SAW devices and their uses in signal processing. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64597 Colloquium on 'High Temperature Electronics'.
London, England: IEE (1983), 40 pp.
Conference held at: London, England. Date 23 March 1983. The following topics were dealt with: electronic systems; resistance thermometry; power supply design; photomultipliers; geophysical techniques; nuclear reactor instrumentation; pyrometry. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

64598 Proceedings of the VI High Energy Physics Symposium (papers in summary form only received).
Bombay, India: Dept. Atomic Energy (1982), 146 pp.
Conference held at: Mysore, India. Date 6-11 Dec. 1982. The following topics were dealt with: left-right asymmetry in GUT's, n-n̄ oscillations, quark models in SU(n), SO(n) models, particle mass scales, proton decay, quark jets, deep inelastic processes, magnetic moments, chiral symmetries, charmed particles, baryon-nucleon reactions, meson-nucleon reactions, e^+e^- annihilation, experimental techniques. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

01.30K Handbooks, dictionaries, tables and data compilation

64599 Compilation of coupling constants and low-energy parameters: 1982 edition. O.Dumbrajs, R.Koch, H.Pilkuhn (Univ. of Karlsruhe, Karlsruhe, Germany), G.C.Oades, H.Behrens, J.J.De Swart.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.277-335 (2 May 1983).
The work is an updating of the previous compilation by Nagels (1979). The authors have adopted as much as possible the connections of Bjorken (1964), Gasiorowicz (1966), and Pilkuhn (1979). They have omitted the sections on YN scattering and Regge residues and a section on QCD has been added. (240 refs.)

64600 Behaviour of the AB_2 type compounds at high pressures and high temperatures. L.Merrill (Dept. of Chem., Brigham Young Univ., Provo, UT, USA).
J. Phys. & Chem. Ref. Data (USA), vol.11, no.4, p.1005-64 (1982).
Data on the polymorphic phase transformations of known compounds and new synthetic compounds of the type AB_2 have been compiled and evaluated. All available pressure studies have been included and referenced. Pressure-temperature phase diagrams showing first order solid-solid phase boundaries and/or melting curves showing the best fit to the experimental data are included. For some materials which can be produced only by chemical synthesis techniques at high pressures and high temperatures, reaction-product diagrams have been employed to estimate the region of thermodynamic stability. Crystallographic data of all the known phases of each material have been tabulated and evaluated. This review covers 168 compounds and 332 phases including the room temperature atmospheric pressure phase for each compound when it exists. (278 refs.)

64601 Heat capacity and other thermodynamic properties of linear macromolecules. VI. Acrylic polymers. U.Gaur, S.Lau, B.B.Wunderlich, B.Wunderlich (Dept. of Chem., Rensselaer Polytech. Inst., Troy, NY, USA).
J. Phys. & Chem. Ref. Data (USA), vol.11, no.4, p.1065-89 (1982).
For pt.V see ibid., vol.11, p.313 (1982). Heat capacity of poly(methyl methacrylate), polyacrylonitrile, poly(methyl acrylate), poly(ethyl acrylate), poly(n-butyl acrylate), poly(iso-butyl acrylate), poly(octadecyl acrylate), poly(methacrylic acid), poly(ethyl methacrylate), poly(n-butyl methacrylate), poly(iso-butyl methacrylate), poly(hexyl methacrylate), poly(dodecyl methacrylate), poly(octadecyl methacrylate) and polymethacrylamide is reviewed on the basis of measurements of 35 samples reported in the literature. A set of recommended data are derived for each acrylic polymer in the amorphous state. Enthalpy and entropy functions are calculated for poly(methyl methacrylate) and polyacrylonitrile. This is the sixth paper in a series of publications which will ultimately cover all heat capacity measurements on linear macromolecules. (56 refs.)

64602 Molecular form factors and photon coherent scattering cross sections of water. L.R.M.Morin.
J. Phys. & Chem. Ref. Data (USA), vol.11, no.4, p.1091-8 (1982).
Tabulations are presented of molecular form factors $F(x)$, for values of $x=\sin(\theta/2)/\lambda$ from 0 to 1.25 $\mathrm{\AA}^{-1}$, for liquid water at eight temperatures between 4°C and 200°C and for the free water molecule. For liquid water, $x=0$ to 1.25 $\mathrm{\AA}^{-1}$, the tabulated values are interpolated from experimental values of Narten and Levy (1971). For the free water molecule, $x=0$ to 1.25 $\mathrm{\AA}^{-1}$, the tabulated values are interpolated from calculated values of Blum (1971). For $x=1.25$ to 10^9 $\mathrm{\AA}^{-1}$, the independent atomic scattering hypothesis is assumed and the water molecular form factor $F(x)$ is calculated from the hydrogen and oxygen atomic form factors given by Hubbell and Overbo (1979). Tables of coherent scattering cross sections, obtained by numerical integration of the Thomson formula, weighted by $F^2(x)$, are presented for liquid water at eight temperatures between 4°C and 200°C and for the free water molecule, for photon energies 5 keV to 1 MeV. (12 refs.)

64603 Evaluation of binary *PTxy* vapor-liquid equilibrium data for C_6 hydrocarbons. Benzene+cyclohexane. D.B.Smith, O.Muthu, A.Dewan, M.Gierlach (Thermodynamics Res. Lab., Washington Univ., St. Louis, MO, USA).
J. Phys. & Chem. Ref. Data (USA), vol.11, no.4, p.1099-126 (1982).
The methods used to evaluate subcritical binary *PTxy* vapor-liquid equilibrium data are described. The evaluation results for the benzene+cyclohexane system are presented. The needs for new experimental data are defined. (3 refs.)

64604 Evaluation of binary excess enthalpy data for C_6 hydrocarbons. Benzene+cyclohexane. B.D.Smith, O.Muthu, A.Dewan, M.Gierlach (Thermodynamics Res. Lab., Washington Univ., St. Louis, MO, USA).
J. Phys. & Chem. Ref. Data (USA), vol.11, no.4, p.1127-49 (1982).
The methods used to evaluate excess enthalpy data are described. The evaluation results for the benzene+cyclohexane system are presented. The needs for new experimental data are defined. (3 refs.)

64605 Evaluation of binary excess volume data for C_6 hydrocarbons. Benzene+cyclohexane. B.D.Smith, O.Muthu, A.Dewan, M.Gierlach (Thermodynamics Res. Lab., Washington Univ., St. Louis, MO, USA).
J. Phys. & Chem. Ref. Data (USA), vol.11, no.4, p.1151-69 (1982).
The methods used to evaluate excess volume data are described. The evaluation results for the benzene+cyclohexane system are presented. The needs for new experimental data are defined. (6 refs.)

01.30M Textbooks for graduates and researchers

64606 Progress in boundary element methods. Vol.2. C.A.Brebbia [Ed.]
Plymouth, England: Pentech Press (1983), 217 pp. [0 7273 1611 7]
Volume 2 of the series brings together a new range of applications of boundary element methods (BEM). The book is divided into eight chapters dealing with: nonlinear potential problems; wave propagation phenomena; fracture mechanics stress analysis; linear isotropic elasticity with body forces; the boundary element method applied to two-dimensional contact problems; boundary integral equations for bending of thin plates; fluid structure interaction; and viscoplasticity and creep using boundary elements.

01.40 EDUCATION

64607 Teaching neutron diffusion theory. J.D.Lewins.
Nucl. Eng. (GB), vol.24, no.2, p.44-8 (March-April 1983).
This note arises from experiences of teaching neutron diffusion theory to engineering students where there is neither the time, nor perhaps the inclination, to explore the underlying disciplines of neutron transport theory. The author's concern has been to introduce the model and equations in the most effective way and this note covers two or three points that have arisen in the context of developing the equations of the one-group neutron diffusion approximation. (4 refs.)

01.50 EDUCATIONAL AIDS

64608 Second quantization in nonrelativistic quantum mechanics. D.H.Kobe (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
Am. J. Phys. (USA), vol.51, no.4, p.312-15 (April 1983).
Second quantization in nonrelativistic quantum mechanics is given in a simplified way using eigenstates of the number operator. The field creation operator is shown to be the operator which adds a particle with a delta-function wave function to the system, while the field annihilation operator removes a particle with a delta-function wave function from the system. The field creation operator is proved to be the Hermitian conjugate of the annihilation operator. The communication (anticommutation) relations for boson (fermion) field operators are proved from the symmetry (antisymmetry) of the many-particle wave function. The second quantized form of one- and two-particle operators is obtained from their form in wave mechanics using the definition of the field creation and annihilation operators. (12 refs.)

64609 Double-exposure speckle photography for the measurement of small displacements. E.S.Wu, D.B.Geohegan (Dept. of Phys., Univ. of Maryland, Baltimore, MD, USA).
Am. J. Phys. (USA), vol.51, no.4, p.315-20 (April 1983).
The method of double-exposure speckle photography (DESP) has been illustrated in experiments to determine the small displacements of a solid object. The object was illuminated by laser light and the speckle pattern was photographed on a stationary photographic film twice, once before and once after the object was displaced. The doubly exposed film, after being photographically processed, was illuminated by laser light to produce equally spaced Young's interference fringes on the Fraunhofer diffraction plane. From the spacing and the orientation of these fringes, both the magnitude and the direction of the displacement were determined. The authors have used the DESP method to measure the small length change of a cadmium tube due to thermal expansion and determined the linear thermal expansion coefficient of cadmium. (9 refs.)

64610 Instrumenting an *e/m* experiment for use in large enrollment courses. F.C.Peterson (Dept. of Phys., Iowa State Univ., Ames, IA, USA).
Am. J. Phys. (USA), vol.51, no.4, p.320-2 (April 1983).
In order to better meet the needs of a large enrollment introductory physics laboratory various accessories for a commercially available *e/m* apparatus have been designed and constructed. The purpose, details, and use of these accessories are described. (6 refs.)

64611 How can a particle absorb more than the light incident on it?. C.F.Bohren (Dept. of Meteorology, Pennsylvania State Univ., University Park, PA, USA).
Am. J. Phys. (USA), vol.51, no.4, p.323-7 (April 1983).
A particle can indeed absorb more than the light incident on it. Metallic particles at ultraviolet frequencies are one class of such particles and insulating particles at infrared frequencies are another. In the former strong absorption is associated with excitation of surface plasmons; in the latter it is associated with excitation of surface phonons. In both instances the target area a particle presents to incident light can be much greater than its geometrical cross-sectional area. This is strikingly evident from the field lines of the Poynting vector in the vicinity of a small sphere illuminated by a plane wave. (14 refs.)

64612 Comment on 'How can a particle absorb more than the light incident on it?'. H.Paul, R.Fischer (Zentralinst. fur Optik & Spektroskopie, Akad. der Wissenschaften, Berlin, Germany).
Am. J. Phys. (USA), vol.51, no.4, p.327 (April 1983).
Independently of the work by C.F. Bohren (1983), the authors investigated the same problem, however, on the atomic scale. Specifically, they considered

the following physical picture: In the presence of an intense (plane-wave-type) coherent resonant monochromatic electromagnetic field, an atom, being initially nonexcited, acquires an electric dipole moment—in the sense of the quantum-mechanical expectation value. This dipole moment, oscillating at the frequency of the incident field, according to classical electrodynamics emits a wave which interferes with the incoming wave. The authors found that the energy flux lines in the superposition field are bent, in a rather large neighborhood of the atom, in such a way as to direct energy into the atom. In fact, the corresponding curves in the x,z plane are very similar to those presented by Bohren (1983). In contrast to his paper, the authors had to deal with a transient phenomenon—the absorption process being finished when the atom has taken up the energy of a single photon. Physically, the essential difference between the results and that of Bohren is that they found the effective absorption cross section of an atom to decrease with growing intensity of the incident field as the inverse of the field amplitude, while the corresponding quantity for a macroscopic particle (with dimensions still small compared with the wavelength) proved to be independent of the field. From the authors study, it becomes evident that the wave picture quite naturally accounts for the well-known large effective absorption cross sections, compared to the geometrical ones, of atomic systems, while the particle picture certainly fails to do so. (2 refs.)

64613 The physics behind path integrals in quantum mechanics. P.D.Mannheim (Dept. of Phys., Univ. of Connecticut, Storrs, CT, USA).
Am. J. Phys. (USA), vol.51, no.4, p.328-34 (April 1983).
Presents a simple pedagogical discussion of the physics of path integrals in nonrelativistic quantum mechanics. Rather than show that the path integral gives the standard results of quantum mechanics, as is usually done in the literature, the author instead discuss why it does so. Specifically, the author discusses why the phase factor associated with each path is given by the classical action. The author constructs the path integral using Huygens's principle. Finally, it is shown that the existence of many paths is a consequence of the spreading of the quantum-mechanical wave function. (7 refs.)

64614 Testing laboratory performance. G.Theysohn, H.-J.Jodl (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
Am. J. Phys. (USA), vol.51, no.4, p.334-8 (April 1983).
A practical test seems to be a more adequate test type for measuring laboratory achievement than written or oral tests, for it is constructed specifically to examine outcomes in laboratory objectives, which can roughly be described as experimental skills. Several suggestions from various authors are reviewed. Their methods are discussed, and an improved way of testing experimental abilities is proposed. It is shown that under certain conditions performance tests may be highly reliable instruments. (24 refs.)

64615 Generalized Fermat principle. W.A.Newcomb (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Am. J. Phys. (USA), vol.51, no.4, p.338-40 (April 1983).
Fermat's principle of least time in geometrical optics is shown to be applicable not only in the usual case of an isotropic medium but also for a general medium of arbitrary anisotropy. (9 refs.)

64616 Spectra of electronic noise signals: A microcomputer experiment. R.E.Jodoin, W.Irish (Dept. of Phys., Rochester Inst. of Technol., Rochester, NY, USA).
Am. J. Phys. (USA), vol.51, no.4, p.340-4 (April 1983).
The authors designed an advanced undergraduate experiment which interfaces a microcomputer to collect samples of noise signals. The data are stored and analyzed for their power spectra. The analysis uses the concepts of autocorrelation and the discrete Fourier transform, and the results are automatically plotted and compared to what is expected. Advantages and limitations of the microcomputer are discussed. (4 refs.)

64617 A constant force generator for the demonstration of Newton's second law. F.Herrmann, T.Muhlbayer (Inst. fur Didaktik der Phys., Univ. Karlsruhe, Karlsruhe, W Germany).
Am. J. Phys. (USA), vol.51, no.4, p.344-6 (April 1983).
A constant force generator is very helpful in demonstrating Newton's second law in the classroom. A device is described which avoids the disadvantages of setups currently used. It is based upon the induction of eddy currents. It is easy to handle and can be self-made. (no refs.)

64618 Dynamics of nonlinear dissipative oscillators. P.Hanggi, P.Riseborough (Dept. of Phys., Polytech. Inst. of New York, New York, NY, USA).
Am. J. Phys. (USA), vol.51, no.4, p.347-52 (April 1983).
The authors review some of the important concepts and theorems dealing with nonlinear dissipative oscillators in the presence of random and deterministic periodic forces, with particular reference to the Van der Pol oscillator. The authors display simple techniques such as the Krylov-Bogoliubov averaging method and generalize this method to random oscillator systems exhibiting new noise-induced phenomena. (24 refs.)

64619 Aristotle is not dead: student understanding of trajectory motion. R.J.Whitaker (Dept. of Phys., Southwest Missouri State Univ., Springfield, MO, USA).
Am. J. Phys. (USA), vol.51, no.4, p.352-7 (April 1983).
The study of motion presents problems to students of beginning physics at all levels. Part of this problem arises because of students' 'common sense' ideas of motion. Six questions on trajectory motion, based on Galileo's 'thought experiments' in his Dialogue Concerning the Two Chief World Systems, were given to students in several different introductory physics classes. These responses are analyzed and discussed. (16 refs.)

64620 Maximum projectile range with drag and lift, with particular application to golf. H.Erlichson (Dept. of Appl. Sci., The Coll. of Staten Island, New York, NY, USA).
Am. J. Phys. (USA), vol.51, no.4, p.357-62 (April 1983).
This paper explores the interesting problem of projectile motion without the vacuum idealization. Particular attention is paid to golf ball trajectories with and without lift. No lift trajectories with linear and quadratic drag are considered first. Then, trajectories with lift and linear drag are investigated. Projection angles for maximum range are determined for all these cases. Computer solutions are used throughout, with a Runge-Kutta routine used for all cases except for the well-known closed solution for the no lift, linear drag projectile. (15 refs.)

64621 Latent heat and low-temperature heat capacity experiment for the general physics laboratory. C.W.Tompson, H.W.White (Dept. of Phys., Univ. of Missouri, Columbia, MO, USA).
Am. J. Phys. (USA), vol.51, no.4, p.362-4 (April 1983).
An experiment to measure the latent heat of vaporization of liquid nitrogen and the average heat capacities at constant pressure of several materials in the temperature range 77-295K is described. This exercise uses normally available laboratory apparatus and is suitable for the general physics laboratory. (2 refs.)

64622 Remark on the isotropic form of the Schwarzschild interior metric. H.A.Buchdahl (Dept. of Theoretical Phys., Australian Nat. Univ., Canberra, Australia).
Am. J. Phys. (USA), vol.51, no.4, p.364-6 (April 1983).
In the course of determining the Scharzschild interior solution in isotropic coordinates it turns out that to a given density and coordinate radius there in general correspond two possible spheres which have distinct masses and distinct physical radii. This situation is here described in detail. (18 refs.)

64623 Electronic Cavendish device. R.E.Crandall (Dept. of Phys., Reed Coll., Portland, OR, USA).
Am. J. Phys. (USA), vol.51, no.4, p.367-8 (April 1983).
The Cavendish torsion-balance method of detecting gravitational forces, while elegant and highly educational, is difficult to arrange as a lecture demonstration. The chief reason for this is the large settling time for torque-induced rotation. Described here is an apparatus in which the torsion bar does not appreciably rotate. A simple electronic servomechanism is used to maintain rotational equilibrium as an external mass is introduced. The resulting servo correction voltage is proportional to the torque induced by gravity. This effect can be observed in tens of seconds. (1 ref.)

64624 Illustrative examples of the symplectic group. Y.S.Kim (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA), M.E.Noz.
Am. J. Phys. (USA), vol.51, no.4, p.368-75 (April 1983).
Simple illustrative examples are given for understanding the symplectic group. Transformation properties of the Sp(2) group are discussed in terms of the two-dimensional geometry of circles and ellipses, two-by-two matrices, and in terms of a group-theoretical language similar to that of the Pauli spin matrices. The isomorphism between the Sp(2) and SO(2,1) groups is discussed in detail. It is noted that this isomorphism is similar to that between the SU(2) and rotation groups. Simple illustrative physical examples are given also for using the symplectic group in nuclear physics, statistical mechanics, and in high-energy physics. (40 refs.)

64625 A new parametrization of the rotation matrix. E.Pina (Dept. of Phys., Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Am. J. Phys. (USA), vol.51, no.4, p.375-9 (April 1983).
A new parametrization of the rotation matrix is presented assuming it is known that this matrix transforms a particular vector into another vector. The matrix is expressed as a function of these vectors and of an angle which measures the deviation from the shortest possible rotation. Some applications of this representation to dynamics are also explained. (9 refs.)

64626 Three-dimensional interference-diffraction patterns. D.D.Long, L.C.Bolling (Dept. of Phys., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Am. J. Phys. (USA), vol.51, no.4, p.380-1 (April 1983).
The demonstration the authors describe shows that the light emerges from the slit(s) in a three-dimensional pattern that actually consists of separated beams. The demonstration consists of sending the diffracted light through a smoke-filled transparent box so that the interference-diffraction patterns are visible in three dimensions via the light scattered by smoke particles within the box. Two conditions must be met if the pattern is to be seen throughout the classroom. (1) The box must be far enough from the laser and slits that the fringes are well separated. A distance of several meters is usually convenient. (2) For a low-power laser ($\sim$1 mW), the scattered light must be viewed from near the forward direction if its intensity is to be high enough to make the pattern visible. (5 refs.)

64627 A simple model of a Feshbach resonance. P.A.Fraser (Dept. of Appl. Maths., Univ. of Western Ontario, London, Canada), S.K.Burley.
Eur. J. Phys. (GB), vol.3, no.4, p.230-8 (1982).
A simple model, suitable for student calculation and exploration, that gives rise to a closed channel or Feshbach resonance is described. The model involves delta-function shell potentials. A range of illustrative examples is presented. (4 refs.)

64628 Model experiment illustrating sedimentation by microcomputer. H.Minowa (Phys. Dept., Numazu Nat. Coll. of Technol., Numazu-shi, Shizuoka, Japan), D.Toya, N.Mishima.
Eur. J. Phys. (GB), vol.3, no.4, p.239-44 (1982).
Gives a model experiment by microcomputer on the sedimentation phenomenon in brownian motion. The simulation is performed by utilising the model of two-dimensional Brownian motion developed in a previous paper. The results can be compared with the exact analytical solution of the Smoluchowski equation and with its numerical calculations. Through these works the sedimentation of Brownian particles has become an interesting and educational subject in the undergraduate physics course. (6 refs.)

64629 Physics for architects. E.M.Anastassakis (Phys. Dept., Nat. Tech. Univ., Athens, Greece).
Eur. J. Phys. (GB), vol.3, no.4, p.247-9 (1982).
The structure of a one-semester physics course for architects is described. It has been designed and intended to serve the architecture student as an engineer, an artist and a concerned individual. (8 refs.)

64630 The calculation of potential energy curves of diatomic molecules: the RKR method. F.Castano, J.de Juan, E.Martinez (Dept. de Quimica Fisica, Facultad de Ciencias, Univ. del Pais Vasco, Bilbao, Spain).
J. Chem. Educ. (USA), vol.60, no.2, p.91-3 (Feb. 1983).
Both procedures (Morse and RKR) are compared for the spectroscopically well-known $I_2(X^1\Sigma_g^+)$ state. (19 refs.)

64631 Degas' dancers: an illustration for rotational isomers. I.Hargittai (Acad. of Sci., Budapest, Hungary).
J. Chem. Educ. (USA), vol.60, no.2, p.94 (Feb. 1983).
Two drawings by Degas—'End of the Arabesque' and 'Seated Dancer Adjusting Her Shoes'—provide an opportunity to introduce the concepts of staggered and eclipsed conformations of A_2B-BC_2 molecules in a concrete, interesting (and aesthetic) way. (no refs.)

64632 Correct representation of conformational equilibria. F.Fulop, G.Bernath (Inst. of Pharmaceutical Chem., Univ. Medical School, Szeged, Hungary), J.A.Szabo, Gy.Dombi.
J. Chem. Educ. (USA), vol.60, no.2, p.95 (Feb. 1983).
The problem is presented using the example of depicting the conformational equilibrium of 2-methyl-1-cyclohexanone, which has only one chiral carbon. (11 refs.)

64633 Deriving $S=k\ln\Omega$. M.P.Melrose (King's Coll., Univ. of London, London, England).
J. Chem. Educ. (USA), vol.60, no.2, p.106-8 (Feb. 1983).
The derivation presented makes what is possibly the minimum assumption for there to be a relationship between statistical mechanics and thermodynamics: that a system in statistical equilibrium is also in thermodynamic equilibrium. That is, when $\ln\Omega$ has attained a maximum value in an isolated system, all parts of the system which can interact thermally have the same temperatures as all parts which can interact mechanically have the same pressure. (5 refs.)

64634 The steady state and equilibrium assumptions in chemical kinetics. D.C.Tardy, E.D.Cater (Univ. of Iowa, Iowa City, IA, USA).
J. Chem. Educ. (USA), vol.60, no.2, p.109-11 (Feb. 1983).
Two approximation methods are often used in obtaining the desired rate law: (a) steady state approximation, and (b) equilibrium approximation. The authors delineate between the two approximations, and demonstrate the importance of making the equilibrium assumption at the appropriate step in the calculation. The ozone decomposition was chosen as the example because of the current interest in the ozone depletion problem, and because the elementary rate constants are known. They first discuss the principles, then show numerically how closely both approximations approach the exact case. (5 refs.)

64635 Relativistic effects on chemical properties. D.R.McKelvey (Indiana Univ. of Pennsylvania, Indiana, PA, USA).
J. Chem. Educ. (USA), vol.60, no.2, p.112-16 (Feb. 1983).
The author traces the development of the relativistic wave equation, the Dirac equation, starting with the Bohr treatment of the hydrogen atom. Relativistic effects are shown to be largely responsible for the chemical differences between the fifth and sixth row elements. Relativistic effects account for the 'inert pair' effect, contribute to the lanthanide contraction and are probably responsible for the unusual stability of Hg_2^{2+}. The author believes that the Dirac treatment and its consequences have a definite place in the undergraduate curriculum and should be receiving considerably more emphasis than they are given at present. (11 refs.)

64636 A simple theory to predict small changes in volume and refractivity during mixing of a two-component liquid system. T.M.Aminabhavi (Southwest Texas State Univ., San Marcos, TX, USA).
J. Chem. Educ. (USA), vol.60, no.2, p.117-18 (Feb. 1983).
Investigates the combined use of the two experimental parameters partial molar volumes and molar refractivities in the study of binary liquid mixtures. (4 refs.)

64637 Construction of lines of constant density and constant refractive index for ternary liquid mixtures. A.Z.Tasic, B.D.Djordjevic (Dept. of Chem. Engng., Faculty of Technol. & Metall., Univ. of Beograd, Beograd, Yugoslavia).
J. Chem. Educ. (USA), vol.60, no.2, p.118-20 (Feb. 1983).
Demonstrates the construction of density constant and refractive index constant lines in the triangular coordinate system on the basis of systematic experimental determinations of the density and the refractive index for both homogeneous (single-phase) ternary liquid mixtures (of a known composition) and the corresponding binary combinations. (no refs.)

64638 Computer programs for entrance examinations (by COBOL language). T.Kurata, Y.Saijo, S.Tagawa.
J. Fac. Eng. Chiba Univ. (Japan), vol.34, no.2, p.21-5 (1983). In Japanese.
The authors present computer programs for entrance examinations using COBOL. They compare these with previously written programs in FORTRAN. (1 ref.)

64639 Using interactive computer graphics for statistical education. T.Inoue (Faculty of Engng., Chiba Univ., Chiba, Japan), M.Yasuda, M.Hoshi, M.Taguri.
J. Fac. Eng. Chiba Univ. (Japan), vol.34, no.2, p.65-85 (1983).
A new development of CHESS (CHiba Eduational System for Statistics) is presented in view of the TSS graphic terminal, mainly written in FORTRAN. This is for benefit not only of the students but also of research members. (3 refs.)

64640 Demonstrations of some optical properties of liquid crystals. A.J.Nicastro (Dept. of Phys., Bucknell Univ., Lewisburg, PA, USA).
Phys. Teach. (USA), vol.21, no.3, p.181-2 (March 1983).
Experiments to demonstrate the existence of the liquid crystalline phase, the ordering of the long axes of molecules along one direction and the electro-optical effects in liquid crystal displays are briefly described. (no refs.)

64641 Energy flow in vapour boats. E.V.Garcia (Colegio de Ciencias y Humanidades, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), E.B.Cabrera, R.Espejel, H.R.Riveros.
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.237-44 (Feb. 1983).
Two experiments are described, to be used in high school physics laboratory, based on very simple little vapour boats. The importance of these experiments lies in the opportunity, given to the student, to design the experiment, make the measurements and give an interpretation, all by himself; without disturbing the budget nor needing very complicated physical concepts. At the end the experimental values obtained and the procedure used are presented. (7 refs.)

64642 Visual training aids, set no.15: steel and cast-iron (crystalline) structures. J.Dejieux (Inst. de Soudure, Paris, France).
Souder (France), vol.4, no.2, p.37-40 (March 1982). In French. [received: March 1983]
Methods are described for producing micrographic slides of crystalline structures in steels and cast iron. Samples of metal are prepared for microscope by diamond paste polishing and etching with Nital to highlight perlite against ferrite and cementite. Other samples are then etched with boiling alkaline sodium picrate to highlight cementite. Twenty examples are shown. Slide sets are available from Soudure Autogene, 32 Boulevard de la Chapelle, 75880 Paris, Cedex 18. (no refs.) *A.E.W.*

01.55 GENERAL PHYSICS

64643 Interdisciplinary approaches in physics—the concepts. J.Vlachy.
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B32, no.11, p.1311-17 (1982).
Interdisciplinarity is one of the key words in science nowadays. Team work, cross-disciplinary and multidisciplinary co-operation have become other common expressions, almost slogans. The fringe areas are taken for the best factor of new integration processes in science, the candidates for major breakthroughs in knowledge and in understanding. World literature on interdisciplinarity has well surpassed the 2000-entry margin. Many of the documents deal with physics which makes a comprehensive review virtually impossible. The author tries to summarize and update older reports on interdisciplinary approaches in general and in physics research. (29 refs.)

01.65 HISTORY OF SCIENCE

64644 Early electrostatic accelerators and some later developments. R.G.Herb (Nat. Electrostatics Corp., Middleton, WI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1359-62 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The author describes the development of electrostatic accelerators from 1930 to the present situation. (no refs.)

01.70 PHILOSOPHY OF SCIENCE

64645 Probabilistic causality and the question of transitivity. E.Eells, E.Sober (Dept. of Philosophy, Univ. of Wisconsin, Madison, WI, USA).
Philos. Sci. (USA), vol.50, no.1, p.35-57 (March 1983).
After clarifying the probabilistic conception of causality suggested by Good (1961-2), Suppes (1970), Cartwright (1979), and Skyrms (1980), the authors prove a sufficient condition for transitivity of causal chains. The bearing of these considerations on the units of selection problem in evolutionary theory and on the Newcomb paradox in decision theory is then discussed. (25 refs.)

01.75 SCIENCE AND SOCIETY

64646 Conditions for the successful use of science. C.Carter.
Science (USA), vol.219, no.4590, p.1295-8 (18 March 1983).
There is ground for concern that the British research and development effort, which is of considerable size, may not be well distributed. In some areas of intense scientific effort, commercial priorities tend to be forgotten. Too many of the units of the economic system are backward in understanding what science can offer and inefficient in using the opportunities which it provides. Evidence suggests that the successful use of science depends of the overall quality of management rather than specifically on its degree of scientific knowledge. (8 refs.)

02.00 MATHEMATICAL METHODS IN PHYSICS

02.10 ALGEBRA, SET THEORY, AND GRAPH THEORY

64647 Expression for y_{LM} [$(\mathbf{r}_1\wedge\mathbf{r}_2)\wedge\mathbf{r}_3$]. T.A.Antone (Dept. of Math., Ahmadu Bello Univ., Zaria, Nigeria).
J. Math. Phys. (USA), vol.24, no.5, p.1060-1 (May 1983).
The solid harmonic y_{LM} [$(\mathbf{r}_1\wedge\mathbf{r}_2)\wedge\mathbf{r}_3$] is expressed in terms of the spherical harmonics $Y(L_1M_2)(\hat{\mathbf{r}}_1)$, $Y(L_2M_2)(\hat{\mathbf{r}}_2)$, and $Y(L_3M_3)(\hat{\mathbf{r}}_3)$. The calculation of the coefficients in the given expansion in terms of $9-j$ symbols explicitly justifies the expanded form. (3 refs.)

64648 Superposition principles for matrix Riccati equations. J.Harnad, P.Winternitz (Centre de Recherche de Math. Appl., Univ. de Montreal, Montreal, Quebec, Canada), R.L.Anderson.
J. Math. Phys. (USA), vol.24, no.5, p.1062-72 (May 1983).
A superposition rule is obtained for the matrix Riccati equation (MRE) $\dot{W}=A+WB+CW+WDW$ [where $W(t)$, $A(t)$, $B(t)$, $C(t)$, and $D(t)$ are real $n\times n$ matrices], expressing the general solution in terms of five known solutions for all $n\geq 2$. The symplectic MRE ($W=W^T$, $A=A^T$, $D=D^T$, $C=B^T$) is treated separately, and a superposition rule is derived involving only four known solutions. For the 'unitary' and GL(n,**R**) subcases (with $D=A$ and $C=B^T$, or $D=-A$ and $C=B^T$, respectively), superposition rules are obtained involving only two solutions. The derivation of these results is based upon an interpretation of the MRE in terms of the action of the groups SL($2n$,**R**), SP($2n$,**R**), U(n), and GL(n,**R**) on the Grassman manifold $G_n(\mathbf{R}^{2n})$. 64649 Weight multiplicity for Cartan classes. V.Amar, U.Dozzio, C.Oleari (Istituto di Fisica, Univ. di Parma, Parma, Itlay).
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.201-9 (April 1983).
The important of simple Lie groups in physics is well known. This program computes the multiplicity of the dominant weights in a given irreducible representation of the Cartan classes $B(N)$,$C(N)$ and $D(N)$. (12 refs.)

64650 Harmonic polynomials invariant under a finite subgroup of O(n). A.Ronveaux (Dept. de Phys., Facultes Univ. Notre-Dame de la Paix, Namur, Belgium), Y.Saint-Aubin.
J. Math. Phys. (USA), vol.24, no.5, p.1037-40 (May 1983).
In this paper, an algorithm is described which allows a systematic computation of harmonic polynomials of a given degree invariant under a finite subgroup of the group O(n). An application of the algorithm to the octahedral (cubic) subgroup is given. (22 refs.)

02.30 FUNCTION THEORY, ANALYSIS

64651 **ERIKA—a program for the decomposition of line spectra.** M.Rysavy, M.Fiser (Nuclear Phys. Inst., Czechoslovak Acad. Sci., Prague, Czechoslovakia).
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.171-83 (April 1983).
Line spectra are described by an analytic function depending on several parameters (height, position and shape parameters). The optimum values of these parameters are determined by the minimization of the function χ^2 using the simplex minimization method. Moreover, a background which may also be a function of several parameters is fitted as well. (4 refs.)

64652 **Comments on 'A more precise statement of Hamilton's principle'.** U.Yurtsever (Dept. of Phys., Middle East Tech. Univ., Ankara, Turkey).
Found. Phys. (USA), vol.13, no.5, p.529-37 (May 1983).
Among the problems C.D. Bailey has questioned (ibid., vol.11, p.279, 1981) are a precise and general formulation of Hamilton's variational principle and the establishment of a sufficiency criterion for this to be a minimum principle. The author tries to answer these questions using the geometric theory of classical mechanics. (4 refs.)

64653 **Hamilton's law or Hamilton's principle: a response to Ulvi Yurtsever.** C.D.Bailey (Ohio State Univ., Columbus, OH, USA).
Found. Phys. (USA), vol.13, no.5, p.539-44 (May 1983).
For Yurtsever's paper see ibid., vol.13, no.5, p.529-37 (1983). The law of varying action and Hamilton's principle of classical mechanics are discussed. It is now clear that the law of varying action, introduced by Hamilton in his papers of 1834 and 1835, was never recognised by either the mathematicians or other scientists who followed him. Why this occurred is discussed. (28 refs.)

64654 **A Galerkin method and nonlinear oscillations and waves.** Fengsu Chen, D.Y.Hsieh (Div. of Appl. Math., Brown Univ., Providence, RI, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1041-6 (May 1983).
A Galerkin method is developed as a generalization of the variational averaging method to deal with problems with dissipation. Some nonlinear oscillations, nonlinear waves, and nonlinear stability problems are studied to illustrate the application of the new method. It is demonstrated that when the dissipative parameter is small, the solutions agree with those obtained by other established methods. (8 refs.)

64655 **Some infinite series of products of Legendre and gamma functions.** H.van Haeringen (Dept. of Math., Delft Univ. of Technol., Delft, Netherlands).
J. Math. Phys. (USA), vol.24, no.5, p.1054-7 (May 1983).
The author derives closed expressions for some infinite series of products of Legendre functions and gamma functions. A particular series has been used to obtain the partial-wave projected quantum mechanical Coulomb transition matrix in closed analytic form for all partial waves, $l=0, 1, \ldots$ (9 refs.)

64656 **A simple proof of a transformation formula for elliptic integrals.** B.Bassetti, E.Montaldi, M.Raciti (Istituto di Sci. Fisiche, Univ. degli Studi di Milano, Milano, Italy).
J. Math. Phys. (USA), vol.24, no.5, p.1058-9 (May 1983).
A very simple proof of a quadratic transformation formula for elliptic integrals found by Carlson in 1977 is given. (7 refs.)

64657 **The study of Bloch equations.** E.F.Apushkinskii, E.G.Moskalev.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.105-7 (Feb. 1983). In Russian.
The presentation of the solution of the Bloch matrix equation in the form of the infinite product is considered. A region of this product convergence is found and the convergence is shown to proceed rather quickly. (3 refs.)

02.60 NUMERICAL APPROXIMATION AND ANALYSIS

64658 **Fast relaxation method for solving the difference problem for the Poisson equation on a sequence of grids.** E.A.Ayrjan, E.P.Zhidkov, B.N.Khoromsky (Lab. of Computing Techniques & Automation, Dubna, Moscow, USSR).
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.125-30 (April 1983).
A method for accelerating the convergence of iterative processes on a sequence of grids is proposed, which makes use of the decomposition of the difference solution into powers of the discretization step. Approximation solutions from a number of auxiliary grids are extrapolated to the exact solution on the finest grid. In the case of a difference problem for the Poisson equation the error of such extrapolation on the last grid is quickly suppressed by simple iterations due to some smoothness properties of the difference-operator eigenfunctions. The results of numerical experiments are presented which illustrate the high efficiency of the proposed method for solution of the given problem. (10 refs.)

64659 **Tracing complex singularities with spectral methods.** C.Sulem (Dept. de Math., Univ. de Nice, Nice, France), P.-L.Sulem, H.Frisch.
J. Comput. Phys. (USA), vol.50, no.1, p.138-61 (April 1983).
A numerical method for investigating the possibility of blow-up after a finite time is introduced for a large class of nonlinear evolution problems. With initial data analytic in the space variable(s), the solutions have for any $t>O$ complex-space singularities at the edge of an analyticity strip of width $\delta(t)$. Loss of regularity corresponds to the vanishing of $\delta(t)$. Numerical integration by high resolution spectral methods reveals the large wavenumber behavior of the Fourier transform of the solutions, from which $\delta(t)$ is readily obtained. Its time evolution can be traced down to about one mesh length. By extrapolation of $\delta(t)$, such numerical experiments provide evidence suggesting finite-time blow-up or all-time regularity. The method is tested on the inviscid and viscous Burgers equations and is applied to the one-dimensional nonlinear Schrodinger equation with quartic potential and to the two-dimensional incompressible Euler equation, all with periodic boundary conditions. In the

latter case evidence is found suggesting that existing all-time regularity results can be substantially sharpened. (33 refs.)

64660 Numerical conformal mapping and analytic continuation. F.Bisshopp (Brown Univ., Providence, RI, USA).
Q. Appl. Math. (USA), vol.41, no.1, p.125-42 (April 1983).
A numerical method for determination of least-square approximations of an arbitrary complex mapping function is derived and implemented with fast Fourier transforms (FFTs). An essential feature of the method is the factoring of a discrete Hilbert transform in a pair of Fourier transforms in order to reduce the operation count of the longest computation to $O(\mathrm{N}\log\mathrm{N})$. A similar factoring of the discrete Poisson integral formula allows an explicit inversion of it in $O(\mathrm{N}\log\mathrm{N})$ operations instead of $O(\mathrm{N}^3)$. The resulting scheme for analytic continuation appears to be considerably more reliable than the elevation of polynomials. Examples are treated, and APL implementations of algorithms are provided. (7 refs.)

03.00 CLASSICAL AND QUANTUM PHYSICS; MECHANICS AND FIELDS

03.20 CLASSICAL MECHANICS OF DISCRETE SYSTEMS: GENERAL MATHEMATICAL ASPECTS

(for applied classical mechanics of discrete systems, see 46.10; for celestial mechanics, see 95.10)

64662 Note on equivalent Lagrangians and symmetries. W.Sarlet (Inst. voor Theoretische Mech., Rijksuniv. Gent, Gent, Belgium).
J. Phys. A (GB), vol.16, no.7, p.L229-33 (11 May 1983).
Shows that every ordered pair of equivalent Lagrangians determines an equivalence class of dynamical symmetries of non-Noether type. Its explicit construction merely requires a particular solution of a single partial differential equations. Various related aspects are discussed. (15 refs.)

64663 Symmetries, first integrals, and the inverse problem of Lagrangian mechanics. II. W.Sarlet, F.Cantrijn (Inst. voor Theoretische Mech., Rijksuniv. Gent, Gent, Belgium).
J. Phys. A (GB), vol.16, no.7, p.1383-96 (11 May 1983).
For pt.I see ibid., vol.14, p.2227-38 (1981). The paper investigates under what conditions the knowledge of a symmetry and a first integral of a linear system of second-order differential equations provides information about the existence of a Lagrangian. The relationship between symmetries and first integrals through Noether's theorem thereby plays an essential role. The treatment being confined to linear systems and linear symmetries, it is shown that there is no loss of generality in taking only quadratic Lagrangians into consideration. (27 refs.)

64664 On the amplitude decay of strongly non-linear damped oscillators. T.D.Burton (Dept. of Mech. Engng., Washington State Univ., Pullman, WA, USA).
J. Sound & Vib. (GB), vol.87, no.4, p.535-41 (22 April 1983).
The problem considered is that of the amplitude behavior of the strongly non-linear damped oscillator $\ddot{u}+2\epsilon\dot{u}+u+\alpha f(u)=0$, where ϵ is small, u and $f(u)$ are $O(1)$, α may be arbitrarily large, and $f(u)$ is an odd function. A simple approximation to the amplitude decay is obtained by first linearizing the static terms and then using the WKB approximation. Of particular interest is the influence of the non-linearity on the amplitude decay. Several examples which illustrate this influence are provided. (15 refs.)

64665 Analysis of non-linear autonomous conservative oscillators by a time transformation method. T.D.Burton, M.N.Hamdan (Dept. of Mech. Engng., Washington State Univ., Pullman, WA, USA).
J. Sound & Vib. (GB), vol.87, no.4, p.543-54 (22 April 1983).
The problem considered is that of the free vibration of the class of strongly non-linear oscillators $\ddot{u}+mu+\alpha f(u)=0$, where $m=1,0$, or -1, $f(u)$ is a non-linear function of the displacement $u(t)$, and α is not small. Through a continuous stretching of the time t, a new time T is found in whose domain the response is simple harmonic. This time transformation method allows the response $u(t)$ and period τ to be calculated to any desired degree of accuracy; however, the primary objective is to develop reasonably simple, accurate approximations for the oscillators considered. (18 refs.)

64666 On uniqueness of Gauss' least constraint principle. N.Cyganowa.
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.261-7 (1981). In Polish.
P. Stackel (1919) has investigated the uniqueness of the Gauss' principle for a system with restrained and nonrestrained ideal holonomic and linear nonholonomic constraints of the first order. For a regular position of a system the Gauss' principle determines the motion uniquely, while in a singular case non-uniquely. The subsequent development of the problem can be traced in A. Przeborski's papers who has investigated Gauss' principle for the most general case of holonomic and nonholonomic constraints with friction. (3 refs.)

64667 The determination of dynamic factors in a system with two degrees of freedom and Duffing-Hertz nonlinearity. H.Wojciechowski.
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.315-29 (1981). In Polish.
The linearization method of the non-linear conservative system with two degrees of freedom has been considered. The system is excited by aperiodic or impact loads. Linearization of the non-linear motion equations has been performed after having introduced the main coordinates. The system excited by a triangular pulse has been tested in particular. Also a two-mass system with a joining spring of Hertz characteristics has been considered. The system has been excited by the motion impact of a mass m_1 with the initial velocity v_0. For both systems the dynamic factors have been introduced. (16 refs.)

64668 Non-standard analysis in Newtonian mechanics of mass-point. Systems. I. C.Wozniak (Inst. Mech., Uniwersytet Warszawski, Warsaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.355-74 (1981). In Polish.
The author's aim is to apply and to investigate non-standard analysis as the mathematical tool of Newtonian mechanics. Such an approach introduces into mechanics non-Archimedean ordered fields and makes it possible to describe explicitly infinite and infinitesimal values of the physical quantities. Generally speaking, the methods of non-standard analysis in Newtonian mechanics of mass-point systems lead to the wider class of mathematical models of physical phenomena than that which can be obtained within the classical formulation of the discrete mechanics. For example, from the non-standard formulation of the Newton's law of motion in discrete mechanics one can derive the fundamental 'standard' relations of continuum mechanics. The general introduction into non-standard analysis as well as the fundamentals of Newtonian mechanics within non-standard analysis have been outlined. As an example of applications, the new interpretation of the standard concept of constraints has been derived from the Newton's law of motion of certain non-standard unconstrained mass-point systems. (13 refs.)

64669 Fast motion of a heavy rigid body about a fixed point in a resistive medium. L.D.Akulenko, D.D.Leshchenko, F.L.Chernous'ko.
Mech. Solids (USA), vol.17, no.3, p.1-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.5-13 (1982).
Investigates fast rotational motion of a heavy rigid body about a fixed point when external resistance is present. The moment of the resistive forces is assumed to be a linear function of the angular velocity. The system obtained after averaging with respect to Euler-Poinsot motion is analyzed, in the case of fast rotations. (12 refs.)

64670 Some difficulties generated by small sinks in the numerical study of dynamical systems: two examples. J.M.Gambaudo (Dept. de Math., Nice, France), C.Tresser.
Phys. Lett. A (Netherlands), vol.94A, no.9, p.412-14 (4 April 1983).
The authors give explicit examples of periodic sinks with very tiny domains of regular attraction, and of misleading numerical computations of Lyapunov exponents. (3 refs.)

64671 Gyrational motion of disks during free-fall. R.E.Stewart, R.List (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Phys. Fluids (USA), vol.26, no.4, p.920-7 (April 1983).
Experiments with disks having diameters from 2.0 to 3.1 cm falling freely in air at speeds of 1.7-3.3 m $\sec^{-1}$ were conducted with a vertically driven, also falling, high-speed camera in order to show that the gyroscopic-like motion, gyration, is the most general type of rotational motion. From analysis of the films, position and orientation were measured throughout the fall and translatory and angular motions were determined, together with the forces and torques which caused the motion. The existence of gyrational motions was confirmed together with straight oscillatory and rotational fall behavior. Typical nutation/precession frequencies were in the range of 6-11 Hz while typical angular frequencies about the minor axis were 1.8-3.0 Hz. The likelihood of gyration increased with particle density. The observed gyration characteristics of disks were similar to predictions for oblate spheroids. Further, it is postulated that air influences can cause rotation about a horizontal diameter to become unstable and to consequently evolve into gyration. This gyrational

motion may represent a very general mode of free fall for other shapes in a similar range of Reynolds numbers from 2000-5000. (17 refs.)

64672 Modification of Dirac's method of Hamiltonian analysis for constrained systems. R.Di Stefano (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1752-65 (15 April 1983).
A slight modification of Dirac's method of Hamiltonian analysis for constrained systems is introduced. It leads to a verification of Dirac's conjecture that first-class secondary constraints are always symmetry generators in each of the counterexamples to that conjecture which have appeared in the recent literature. Those counterexamples associated with differentiable Hamiltonians are studied; the cases involving nondifferentiable Hamiltonians will be considered separately. The relationship between the Lagrangian and Hamiltonian descriptions is studied in some detail and is used to motivate the author's calling the form of the secondary constraints derived via this modified method the natural form of the secondary constraints. Along the way the author distinguishes between symmetries of the Lagrangian (or Hamiltonian) and symmetries of the Euler-Lagrange (or Hamilton's) equations; the author also distinguishes between form and content invariance. (16 refs.)

64673 Dynamic behavior from asymptotic expansions. J.K.Hale (Brown Univ., Providence, RI, USA).
Q. Appl. Math. (USA), vol.41, no.1, p.161-8 (April 1983).
The authors discuss stability properties of solutions of periodic and almost-periodic differential equations containing a small parameter. The existence of the solution can be obtained in the first approximation but the stability only after k approximations. The results are obtained using asymptotic expansions, higher-order averaging and the concept of exponential hyperbolicity of order k. (7 refs.)

64674 Iteration dynamics. E.Pina (Dept. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.173-96 (Feb. 1983).
A discontinuous formulation of mechanics is developed starting from elementary examples. Linear systems are incorporated and an exact treatment of the pendulum is represented in terms of rational and trigonometric functions. The general formulation for a hamiltonian system is included. A short account of some fundamental properties of iterations, including conjugation and its relation to functional equations, is made. Finally, some properties of the logistic map are studied by using Newton's method to obtain the roots of an equation and a sketch of the method of periodic points is presented. (22 refs.)

03.30 SPECIAL RELATIVITY

64675 Relativistic kinematical diagrams. B.D.Dimitriadis (Phys. Dept., Univ. of Thessaloniki, Thessaloniki, Greece).
Eur. J. Phys. (GB), vol.3, no.4, p.193-201 (1982).
A new geometrical approach to the special relativistic kinematics is described. This approach is based on a relative motion of x axes of inertial frames. The transformation equations valid for this motion are those of Lorentz for the x axes. Since the actual relative motion is involved in the method proposed, it is especially helpful in grasping the deeper physical concept of Special Relativity. (7 refs.)

64676 Manifestly covariant, coordinate-free dyadic expression for planar homogeneous Lorentz transformations. D.E.Fahnline (Pennsylvania State Univ., Altoona, PA, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1080-6 (May 1983).
Parametrizing a planar homogeneous Lorentz transformation P by any timelike or spacelike vector b lying in the transformation plane and its transform $a \equiv Pb$ yields a dyadic expression for P with several advantages. It provides an immediate solution to the problem of finding a homogeneous Lorentz transformation converting a given timelike or spacelike vector into a second similar vector. Its manifestly covariant, coordinate-free form is valid in any Lorentz frame and reduces easily to coordinate form. It unifies timelike (including boosts), spacelike (including pure spatial rotations), and null planar transformations and also orthochronous and nonorthochronous planar transformations into a single form; these classifications depend on the vectors a and b. Only if $a = -b$ does the expression fail, but then its limit as $a \to -b$ still exists and provides a valid expression for P. (8 refs.)

64677 Superluminal coordinate transformations: four-dimensional case. L.Marchildon, A.F.Antippa (Dept. de Phys., Univ du Quebec a Trois-Rivieres, Trois-Rivieres, Quebec, Canada), A.E.Everett.
Phys. Rev. D (USA), vol.27, no.8, p.1740-51 (15 April 1983).
The authors investigate, from a group-theoretical point of view, the possibility of implementing the so-called extended principle of relativity. This consists in postulating that the set of all equivalent reference frames contain frames whose relative velocities are larger than c, in addition to those whose coordinates are related by proper orthochronous Lorentz transformations. They show that implementing the extended principle of relativity by means of either real or complex linear transformations results in strong conflicts with experiment and/or intractable problems of interpretation. They then briefly analyse alternative approaches to four-dimensional superluminal transformations, in which the extended principle of relativity is either weakened or completely abandoned. (43 refs.)

64678 One-dimensional relativistic motion of two bodies with a constant magnitude of the interaction force. N.S.Shavokhina (Joint Inst. for Nuclear Res., USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.641-4 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.66-9 (July 1982). [received: May 1983]
The relativistic linear motion of two bodies with a constant magnitude of the interaction force is considered. Inelastic and elastic collisions of these bodies are investigated. A mathematically exact model of the relativistic oscillator is constructed. (4 refs.)

The computational metaphor and quantum physics .... See Entry 64710

03.40 CLASSICAL MECHANICS OF CONTINUOUS MEDIA: GENERAL MATHEMATICAL ASPECTS

64679 Damage tensors in continuum mechanics. J.Betten (Dept. of Math. Models in Materials Sci., Tech. Univ. Aachen, Aachen, Germany).
J. Mec. Theor. & Appl. (France), vol.2, no.1, p.13-32 (1983).
Starting from a third order skew-symmetric tensor of continuity to represent area vectors (bivectors) of Cauchy's tetrahedron in a damaged stage, the author finally finds a damage tensor of rank two. Constitutive equations of creep are formulated by employing the damage tensor of rank two and a fourth-order tensor characterizing the initial anisotropy or the anisotropy of the material in its undamaged state. In finding very general constitutive equations an irreducible set of tensor generators involving the mentioned argument tensors and an integrity basis associated with the representation of the tensor response function are constructed. In view of more practical use, some simplified representations are discussed. (30 refs.)

64680 An alternative proof of the representation theorem for isotropic, linear asymmetric stress-strain relations. G.Zhong-Heng (Johns Hopkins Univ., Baltimore, MD, USA).
Q. Appl. Math. (USA), vol.41, no.1, p.119-23 (April 1983). (5 refs.)

03.40D Mathematical theory of elasticity

(see also 46.20 Continuum mechanics, and 46.30 Mechanics of solids)

64681 On integral equation methods for elastic boundary value problems. I. Direct methods for static problems. K.Takakuda (Tokyo Inst. of Technol., Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.212, p.186-93 (Feb. 1983).
The applications of the boundary integral equation methods (direct methods) to static elasticity problems are investigated. It is shown that considerable errors may occur in numerical solutions if integral equations are used uncritically. Several suggestions and modifications for the integral equations are presented. (11 refs.)

64682 On the Saint-Venant principle in elasticity. P.Ladeveze (Lab de Mecanique et Technol., ENSET, Cachan, France).
J. Mec. Theor. & Appl. (France), vol.2, no.2, p.161-84 (1983). In French.
An interpretation of the Saint-Venant Principle is proposed. It is developed in the case of elastic anisotropic homogeneous beams of constant cross-section. Two Saint-Venant principles are given, one for the localization of the stresses and the second for the localization of the displacements. Furthermore, some results are given on the structure of solutions to the Saint-Venant problem. (24 refs.)

64683 Investigations of a two-dimensional integral equation in the theory of elasticity and electrostatics. T.S.Sankar, V.I.Fabrikant (Dept. of Mech. Engng., Concordia Univ., Montreal, Quebec, Canada).
J. Mec. Theor. & Appl. (France), vol.2, no.2, p.285-99 (1983).
A two-dimensional integral equation, encountered in some problems of nonhomogeneous elasticity and electrostatics, is considered. An exact solution of this equation is obtained by a special integral representation of the kernel. Two theorems of general mathematical interest are established. Illustrative examples are also considered. (10 refs.)

64684 Exact solutions for a certain hyperbolic 2-conservation law. P.H.Chang (Univ. of Nebraska, Omaha, NE, USA).
Houston J. Math. (USA), vol.8, no.4, p.463-76 (1982).
Considers a certain nonlinear hyperbolic system of two equations in two unknowns with initial conditions prescribed along a segment $-b \leq X \leq b, b > 0$. By a holograph transformation one can invert such a nonlinear hyperbolic system to a linear Euler-Poisson-Darboux (EPD) equation, which describes the vibrations of a membrane and whose solutions can be constructed explicitly in some cases. For these cases, the author uses the inverse functions of the solutions to construct the solutions of the previous nonlinear hyperbolic system. (9 refs.)

64685 Integral equations of plane elasticity for multiply connected domains with corners. S.S.Zargaryan.
Mech. Solids (USA), vol.17, no.3, p.77-86 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.87-98 (1982).
The Sherman-Lauricella integral equations, which yield solutions for plane problems of elasticity for multiply connected regions with a smooth boundary in the case of external forces specified on the boundary, are extended to the case of regions with piecewise-smooth contours. The integrals in this equation are considered as Stieltjes integrals with continuous density; it is demonstrated that the integral operator of the equation when there are corner points on the contour is a generalized Fredholm operator. (20 refs.)

64686 Stress-concentrations in a thin insulated metallic disc in the form of an inverse of an ellipse lying horizontally in a uniform electric field. M.Majumder.
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.606-12 (Nov. 1982). [received: April 1983]
The author deals with a plane-strain problem concerning an isotropic, elastic disc in the form of an inverse of an ellipse, subjected to a uniform electric field. In the problem, stresses and displacements have been expressed in terms of two analytic functions $\Omega(z)$ and $\omega(z)$. The conditions that the boundary is stress-free has been expressed in the form of a functional equation. Using function theoretic method and splitting up $\Omega(\sigma)$ into even and odd functions of σ, the functional equation has been solved and the solution has been obtained in a closed form. (3 refs.)

64687 A boundary integral equation for the solution of a class of problems in anisotropic inhomogeneous thermostatics and elastostatics. D.L.Clements (Univ. of Adelaide, Adelaide, Australia), C.Rogers.
Q. Appl. Math. (USA), vol.41, no.1, p.99-105 (April 1983).
The solution of an important class of boundary-value problems in anisotropic inhomogeneous thermostatics and elastostatics is obtained in terms of a boundary integral equation. The equation may be used as a basis for the numerical solution of particular boundary-value problems. (5 refs.)

64688 Elastic strings under vertical loads. H.J.Weinitschke (Inst fur Angewandte Math., Univ. Erlangen-Nurnberg, Erlangen, Germany).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.218-30 (March 1983).
The general nonlinear equations of an elastic string of length 2 L subject to a symmetric vertical dead load $p(s)=p(-s)$ are analyzed. Existence of unique tensile and not necessarily unique compressive solutions with fixed horizontal displacements $u(\pm L)=\pm u_0$ is proved for a general class of stress strain laws $T=f(e)$. The kinetic stability of tensile solutions ($e>0$) is verified exactly. Kinetic instability of compressive solutions ($e<0$) is obtained only approximately, because a rigorous analysis leads to an unusual indefinite eigenvalue problem that has not been solved yet. (7 refs.)

03.40G Fluid dynamics: general mathematical aspects

(see also 47. Fluid dynamics)

64689 Stationary probability distribution for nonlinear dynamical systems with noise. M.Machacek (Astron. Inst., Czechoslovak Acad. Sci., Ondrejov, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.365-76 (1983).
Any realistic dissipative dynamical system is subject to thermal noise. When this fact is taken into account, the deterministic system of equations is replaced by a system of stochastic differential equations, whose solution is a diffusion process. Transition probability, and hence the stationary probability density, of these processes can be calculated by means of theorems by Girsanov and by Liptser and Shiryaev (1974). The stationary probability density is the solution of an integral equation, the kernel of which is given. (7 refs.)

64690 Homogeneous property and flux splitting in gas dynamics. A.Lerat (Ecole Nationale Superieure d'Arts et Metiers, Paris, France).
J. Mec. Theor. & Appl. (France), vol.2, no.2, p.185-213 (1983). In French.
Considers the homogeneous property of fluxes in gas dynamics and its consequences for flux splitting introduced by Steger and Warming (1981). For any hyperbolic system $w_t+f(w)_x=0$ satisfying the homogeneous property, it is shown that the flux $f(w)$ can be expressed remarkably in terms of the eigenvalues and eigenvectors of the matrix $A(w)=df(w)/dw$ and that the same result holds for the split fluxes $f^+(w)$ and $f^-(w)$. These results are used to study the problem of the validity of flux splitting. Then, three applications of flux splitting are considered: the first one concerns uncentered schemes and specially a precise analysis of their stability, the second one is connected with a method for correcting the dispersive error of second-order accurate schemes and the third application deals with a nonreflecting boundary condition. (13 refs.)

64691 Compact finite difference schemes for the Euler and Navier-Stokes equations. M.E.Rose (Inst. for Computer Applications in Sci. & Engng., NASA Langley Res. Center, Hampton, VA, USA).
J. Comput. Phys. (USA), vol.49, no.3, p.420-42 (March 1983).
Implicit compact finite difference schemes for the Euler equations are described, which furnish equivalent treatment of the conservation and nonconservation forms; a simple modification yields an entropy-producing scheme. An extension of the scheme also treats the compressible Navier-Stokes equations; when the viscosity and heat conduction coefficients are negligible only the boundary data appropriate to the Euler equation influence the solution to any significant extent, a result consistent with singular perturbation theory. (6 refs.)

03.40K Waves and wave propagation: general mathematical aspects

(see also 46.30M Mechanical and elastic waves, 43.20 General linear acoustics)

64692 A new method for generating precisely triangular waves, square waves and trapezoidal waves in three phases. B.Z.Kaplan (Dept. of Electrical Engng., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.2, p.177-83 (April 1983).
A new compact oscillator model for generating symmetrically three phases of triangular, square and trapezoidal waves is developed. Its generated waveforms are precisely stabilized in steady state and they possess a uniquely determined size. The development of the model is carried out with the aid of a previously treated three-dimensional sinusoidal oscillator model of similar performance whose structure is imitated. The dynamic behaviour of the new model is assessed by a numerical solution of its equations on a digital computer. The main advantage of the present model, when compared to a somewhat related three-phase generator model of triangular waves suggested by the authors previously, is that its generated waveforms are all centered around a zero bias level. This feature contributes towards a possibility of a versatile use of the model for the relatively precise applications envisaged in the conclusions section. (6 refs.)

64693 The scattering of a scalar wave by a thin oblate body of revolution. D.Homentcovschi (Central Inst. of Math., Bucharest, Rumania).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.635-48 (1983).
The scattering of a scalar incident wave by a thin oblate body of revolution is studied. The scattering wave is represented as a distribution of ring singularities in a disk inside the body. Boundary conditions result in one-dimensional integral equations for singularity distributions. The asymptotic solution of these equations for thin bodies furnished the singularity distribution as well as the radius α of the disk containing ring singularities. Example of the plane wave axially incident upon an oblate ellipsoid is presented. The total scattering cross-section is computed. (4 refs.)

64694 Wave equation Green's function approximations for nearly-planar half-planes and half-spaces. L.M.Brock (Dept. of Engng. Mech., Univ. of Kentucky, Lexington, KY, USA).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.649-62 (1983).
Studies of subsurface wave-scattering often rely on wave equation Green's functions for half-planes or half-spaces with plane surfaces. Small deviations from the planar are assumed to have negligible effect away from the surface. Based on extensively-developed perturbation schemes, the author gives analytical first-order approximations for 2D and 3D wave equation Green's function in the interiors of respectively, half-spaces by two approaches. The first approach involves a boundary perturbation, while the second approach invokes a coordinate transformation leading to a perturbation of the governing equations themselves. The case of, respectively, the functions and their normal derivatives vanishing on the surface are treated. Some numerical results for specific examples are presented and discussed. (15 refs.)

64695 An iterative method for the Helmholtz equation. A.Bayliss (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA), C.I.Goldstein, E.Turkel.
J. Comput. Phys. (USA), vol.49, no.3, p.443-57 (March 1983).
An iterative algorithm for the solution of the Helmholtz equation is developed. The algorithm is based on a preconditioned conjugate gradient iteration for the normal equations. The preconditioning is based on an SSOR sweep for the discrete Laplacian. Numerical results are presented for a wide variety of problems of physical interest and demonstrate the effectiveness of the algorithm. (27 refs.)

64696 Restricted multiple three-wave interactions: integrable cases of this system and other related systems. C.R.Menyuk, H.H.Chen, Y.C.Lee (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1073-9 (May 1983).
Restricted multiple three-wave interactions, in which a set of wave triads interact through one shared wave, are discussed. It is shown that this system is integrable when all triads have equal coupling coefficients regardless of the frequency mismatches. This system is then used as a starting point from which to determine integrable cases of a more general class of three-wave interactions. (11 refs.)

64697 On the integrability of the Hirota-Satsuma system. W.Oevel (Univ. Paderborn, Paderborn, Germany).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.404-7 (4 April 1983).
The author considers a system of coupled KdV equations which was conjectured to be integrable by Hirota and Satsuma (1981). Using the Lax-pair of this system he finds an infinite hierarchy of commuting symmetries and conservation laws in involution. Yet, the system does not seem to be 'completely integrable' in the usual sense. (10 refs.)

64698 Soliton solutions of the Korteweg-de Vries and Kadomtsev-Petviashvili equations: the wronskian technique. N.C.Freeman, J.J.C.Nimmo (Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.1-3 (11 April 1983).
The soliton solutions of the KdV and KP equations are written in wronskian form and shown by direct substitution to satisfy the equations and the associated Backlund transformation. (6 refs.)

64699 A method of obtaining the *N*-soliton solution of the Boussinesq equation in terms of a wronskian. J.J.C.Nimmo, N.C.Freeman (Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.4-6 (11 April 1983).
By means of a Backlund transformation for the Boussinesq equation in bilinear form, the wronskian form of the N-soliton solution of that equation is deduced. The solution is then verified by direct substitution in the equation. (9 refs.)

64700 A hierarchy of coupled Korteweg-de Vries equations. D.Levi (Istituto di Fisica, Univ. di Roma I, Rome, Italy).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.7-10 (11 April 1983).
The author presents a hierarchy of coupled nonlinear partial differential equations which contains among its members the Hirota and Satsuma coupled Korteweg-de Vries equations; he also displays its simplest Backlund transformation. (8 refs.)

64701 Nonlinear electron Landau damping of ion-acoustic solitons. J.D.Meiss (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA), P.J.Morrison.
Phys. Fluids (USA), vol.26, no.4, p.983-9 (April 1983).
Several authors have treated kinetic effects associated with the ion-acoustic soliton; e.g. Ott and Sudan (1969) investigated linear electron Landau damping and Karpman (1979) and Lotko (1982) have looked at damping due to ion reflection. Here an O'Neil-type frozen wave calculation that includes effects associated with electron orbits in a soliton is presented. This calculation differs from previous ones in that the usual three time scale argument is made: $\omega_{pe}\gg\omega_{be}\gg\gamma_L$. The orbit effects included in this ordering become important at the modest amplitude $e\Phi/T_e\gtrsim(m_e/m_i)^2$. Saturation at finite amplitude is predicted. (21 refs.)

64702 An exterior interface problem in two-dimensional elastodynamics. J.Bielak, R.C.MacCamy (Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Q. Appl. Math. (USA), vol.41, no.1, p.143-59 (April 1983).
The authors present and analyze a method of solution for an interface problem in linear elasticity. The special situation of steady-state time-harmonic, two-dimensional anti-plane strain is dealt with. The physical problem is that one has a half-space of homogeneous, isotropic, linearly elastic material (the Earth) bounded by a traction-free plane. In this material there is an elastic wave incident plus reflected, which is time-periodic with frequency ω. It is assumed that a cylindrical obstacle of different and possibly inhomogeneous material is inserted in the free surface. The problem is to determine the time-period steady-state limit for the total fields inside and outside the obstacle. (11 refs.)

64703 Effects of double passage of waves in randomly inhomogeneous media. Yu.A.Kravtsov, A.I.Saichev (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Sov. Phys.-Usp. (USA), vol.25, no.7, p.494-508 (July 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.137, no.3, p.501-7 (July 1982). [received: April 1983]
In this review, the effects stemming from double passage of reflected and backscattered waves through the same inhomogeneities of the medium, are discussed. The enhancement of phase and intensity fluctuations and of the average intensity and other effects, characteristic of double passage, are described in detail. Multichannel coherent effects, arising due to mutual coherence of different waves passing in opposite directions along identical

channels, are investigated. The experimental work on double passage effects is reviewed. Possible practical applications of these effects are analyzed. (75 refs.)

64704 Solution of boundary-value problems by the *G*-polynomial method. A.K.Orlov.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1314-17 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2134-9 (Nov. 1982). [received: May 1983]
A method is suggested for solving boundary-value problems in mathematical physics using generalized harmonic polynomials. Equations are derived for calculating the parameters of waveguides and resonators bounded by surfaces with complex geometries. The boundary conditions are used to derive equations for the eigenfrequencies. For a spherical resonator, the method gives results accurate to better than 0.01%. The parameters are calculated for a waveguide with polygonal cross section and a problem involving rod torsion is solved. (7 refs.)

64705 A note on the existence of periodic travelling wave solutions with large periods in generalized reaction-diffusion systems. K.R.Schneider (Inst. fur Math., Akad. der Wissenschaften, Berlin, Germany).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.236-40 (March 1983).
The authors shows that the existence of wave trains with high velocity of generalized reaction-diffusion equations can be easily established by using a theorem of D.V. Anosov on the existence of periodic solutions of singularly perturbed differential systems. (5 refs.)

03.50 CLASSICAL FIELD THEORY

64706 The equations of nonlinear electrodynamics as a conservative symmetric-hyperbolic system in generalized co-ordinates. A.Strumia (Istituto di Matematica Applicata, Univ. di Bologna, Bologna, Italy).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.569-73 (23 April 1983).
It is shown that by employing generalized co-ordinates that the system of equations governing nonlinear electrodynamics is a system of conservative equations with convex density. The convexity conditions are given in an explicitly covariant fashion. (13 refs.)

Singularities of angular spectral characteristics of the radiation of an electron moving along the arc of a circle ....See Entry 66190

03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

64707 The Aharonov-Bohm effect and scattering theory. S.N.M.Ruijsenaars (Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).
Ann. Phys. (USA), vol.146, no.1, p.1-34 (March 1983).
The Aharonov-Bohm effect is studied from the viewpoint of scattering theory. A scattering experiment is proposed that could distinguish between two different dynamics that have been considered in the literature. The behavior of the *S*-matrices under gauge transformations is established and an anomalous cluster property is found. (57 refs.)

64708 Some quantum operators with discrete spectrum but classically continuous spectrum. B.Simon (Dept. of Math., California Inst. of Technol., Pasadena, CA, USA).
Ann. Phys. (USA), vol.146, no.1, p.209-20 (March 1983).
The author considers a number of simple quantum Hamiltonians $H(-i\nabla,x)$ with the following property: $H(-i\nabla,x)$ has discrete spectrum even though $\{(p,q)|H(p,q)<E\}$ has infinite volume. (9 refs.)

64709 Energy spectrum of the Kratzer interaction. J.A.C.Gallas (Max-Planck-Inst. fur Quantenoptik, Garching, Munchen, Germany).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.479-80 (15 April 1983).
Kesarwani and Varshni (1982) recently reported the WKB approximation to be capable of producing highly accurate eigenvalues for Kratzer's interaction, if an adequate number of high-order corrections were taken into account. The present author shows that by making the Langer transformation, it is possible to reproduce the known exact results within the first-order theory. (11 refs.)

64710 The computational metaphor and quantum physics. M.J.Manthey, B.M.E.Moret (Univ. of New Mexico, Albuquerque, NM, USA).
Commun. ACM (USA), vol.26, no.2, p.137-45 (Feb. 1983).
Concurrent computational systems, viewed as sets of cooperating processes, are shown to have close analogies in the world of quantum physics. In particular, analogies exist between processes and particles, between a process' state and a particle's mass, between a process's state changes and a particle's velocity, and between interprocess communications and particle interactions. This view allows the application in the computational world of special relativity theory, the uncertainty principle, the law of conservation of momentum, and many of particle physics' fundamental results. This paper describes the basic analogy and some fundamental results. It is the authors' belief that new insights into computational processes will be gained as the analogy is developed and vice versa. It is conceivable that established results of the computational sciences may contribute to a new understanding of some of the problems of physics. Other process-oriented sciences, such as biology, economics, and psychology, could also benefit from such developments. (18 refs.)

64711 On the Schrodinger equation and the eigenvalue problem. P.Li (Dept. of Math., Stanford Univ., Stanford, CA, USA), Shing-tung Yau.
Commun. Math. Phys. (Germany), vol.88, no.3, p.309-18 (March 1983).
If λ_k is tshe k^{th} eigenvalue for the Dirichlet boundary problem on a bounded domain in $\mathbf{R}^n$, H. Weyl's asymptotic formula asserts that $\lambda_k \sim C_n(k/V(D))^{2/n}$, hence $\Sigma_{i=1}{}^k \lambda_i \sim xC_n k^{-x} V(D)^{-2/n}$, were $x=(n+2)/n$. The authors prove that for any domain and for all k, $\Sigma_{i=1}{}^k \lambda_i \geq xk^{-x} V(D)^{-2/n}$. A simple proof for the upper bound of the number of eigenvalues less than or equal to $-\alpha$ for the operator $\Delta\text{-}V(x)$ defined on $\mathbf{R}^n(n \geq 3)$ in terms of $\int_{\mathbf{R}^n}(V+\alpha)_-{}^{n/2}dx$ is also provided. (9 refs.)

64712 Schrodinger operators with an electric field and random for deterministic potentials. F.Bentosela (Dept. de Phys., Univ. de Luminy Marseille, Marseille, France), R.Carmona, P.Duclos, B.Simon, B.Souillard, R.Weder.
Commun. Math. Phys. (Germany), vol.88, no.3, p.387-97 (March 1983).
The authors prove that the Schrodinger operator $H=-d^2/dx^2+V(x)+F.x$ has purely absolutely continuous spectrum for arbitrary constant external field F, for a large class of potentials; this result applies to many periodic, almost periodic and random potentials and in particular to random wells of independent depth for which we prove that when $F=0$, the spectrum is almost surely pure point with exponentially decaying eigenfunctions. (12 refs.)

64713 Examples of discrete Schrodinger operators with pure point spectrum. J.Poschel (ETH-Zentrum, Zurich, Switzerland).
Commun. Math. Phys. (Germany), vol.88, no.4, p.447-63 (1983).
Presents a general approach for constructing potentials for the discrete Schrodinger equation of arbitrary dimension having only pure point spectrum. The author gives examples of limit periodic potentials of that kind such that the pure point spectrum is dense in an interval of a Cantor set of measure zero. (8 refs.)

64714 Localization in ν-dimensional incommensurate structures. J.Bellissard (Univ. de Provence, Marseille, France), R.Lima, E.Scoppola.
Commun. Math. Phys. (Germany), vol.88, no.4, p.465-77 (1983).
The authors exhibit a class of quasi-periodic unbounded potential in the ν-dimensional discrete Schrodinger equation, for which the spectrum is only pure point, with exponentially localized states and a dense set of eigenvalues in $\mathbf{R}$. (11 refs.)

64715 Nonlocality and the Kochen-Specker paradox. P.Heywood, M.L.G.Redhead (Dept. of History & Philosophy of Sci., Chelsea Coll., Univ. of London, London, England).
Found. Phys. (USA), vol.13, no.5, p.481-99 (May 1983).
A new proof of the impossibility of reconciling realism and locality in quantum mechanics is given. Unlike proofs based on Bell's inequality, the authors make minimal and transparent use of probability theory and proceed by demonstrating a Kochen-Specker type of paradox based on the value assignments to the spin components of two spatially separated spin-1 systems in the singlet state of their total spin. An essential part of the argument is to distinguish carefully two commonly confused types of contextuality; the authors call them ontological and environmental contextuality. These in turn are associated with two quite distinct senses of nonlocality. The relevance of the treatment to other related discussions in recent literature on the philosophy of quantum mechanics is indicated. (21 refs.)

64716 On the extended characterisation theorem for quantum logics. E.David (Dept. of Math., Polytech. of the South Bank, London, England), C.S.Sharma.
J. Phys. A (GB), vol.16, no.6, p.L179-80 (21 April 1983).
An inaccuracy in the definition of dual automorphism of a lattice by Sharma and Mukherjee (1977) is corrected and some interesting ramifications are discussed. (3 refs.)

64717 On the Schrodinger equation for the gaussian potential $-A$ exp$(-\lambda r^2)$. C.S.Lai (Dept. of Phys., Univ. of Prince Edward Island, Charlottetown, Prince Edward Island, Canada).
J. Phys. A (GB), vol.16, no.6, p.L181-5 (21 April 1983).
The energy eigenvalues of the attractive radial gaussian potential for various eigenstates are very accurately determined within the framework of the hypervirial-Pade scheme. (12 refs.)

64718 A multiparticle Coulomb system with bound state at threshold. M.Hoffmann-Ostenhof (Inst. fur Theoretische Phys., Univ. Wien, Wien, Austria), T.Hoffmann-Ostenhof, B.Simon.
J. Phys. A (GB), vol.16, no.6, p.1125-31 (21 April 1983).
The authors consider the two-electron Hamiltonian $H=-\Delta_1-\Delta_2-r_1{}^{-1}-r_2{}^{-1}+Ar_{12}{}^{-1}$ at precisely that critical value of A where the ground state energy has just hit the continuum. For that A, it is proven that H has a square integrable eigenfunction at the bottom of the continuum. (17 refs.)

64719 Direct verification of the quantum spin-state superposition law. G.Badurek, H.Rauch, J.Summhammer (Atominst., Osterreichischen Univ., Wien, Austria), U.Kischko, A.Zeilinger.
J. Phys. A (GB), vol.16, no.6, p.1133-9 (21 April 1983).
Coherent superposition of two neutron waves, with mutually opposite polarisation direction, is used to demonstrate the quantum-mechanical properties of spin-state superposition for fermions. (20 refs.)

64720 The Casimir invariants and Gel'fand basis of the graded unitary group SU(m/n). Jin-Quan Chen (Dept. of Phys., Nanjing Univ., Nanjing, China), Xuan-Gen Chen, Mei-Juan Gao.
J. Phys. A (GB), vol.16, no.7, p.1361-76 (11 May 1983).
In the space of f-particle product states, the Casimir invariants of the graded unitary group SU(m/n) are functions of the class operators of the graded coordinate permutation group $\mathring{S}(f)$, which are equal to the class operators of the graded state permutation group $\mathring{\mathcal{S}}(f)$. Formulae for the quadratic and cubic Casimir invariants are given. It is shown that in general the eigenvalue formulae for the U(m/n) Casimir invariants as functions of the partition can be obtained from those for U$(m+n)$ by simply changing the argument of the functions from $(m+n)$ to $(m-n)$. The quasi-standard basis of $\mathring{\mathcal{S}}(f)$ is identified with the Gel'fand basis of SU(m/n), i.e. the irreducible basis classified according to the group chain $\mathrm{SU}(m/n)\supset\mathrm{SU}(m/n-1)\supset\ldots\mathrm{SU}(m)\supset\ldots\mathrm{SU}(2)\supset\mathrm{U}(1)$. The special Gel'fand basis of SU(m/n) (for which the weight is restricted to (1,1,...,1)) can be easily obtained from the Gel'fand basis of SU$(m+n)$ with due allowances for modifying sign factors arising from the grading. The construction of a general SU(m/n) Gel'fand basis is also discussed. (30 refs.)

64721 Boson realisation of the Lie algebra F_4 and non-trivial zeros of 6*j* symbols. J.Van der Jeugt, G.Vanden Berghe, H.De Meyer (Seminarie voor Wiskundige Natuurkunde, Rijksuniv. Gent, Gent, Belgium).
J. Phys. A (GB), vol.16, no.7, p.1377-82 (11 May 1983).
By decomposing the adjoint and lowest dimensional representations of the exceptional Lie algebra F_4 in the reduction $F_4 \rightarrow SO_3$, a boson realisation of a F_4 generator basis is established on account of a standard tensor operator formalism. Such a basis clearly exhibits the non-trivial vanishing of two 6*j* coefficients (discarding Regge symmetries), a property which is closely related to the possible embedding of F_4 into SO_{26}. Prospects for the occurrence of more non-trivial zeros, related to exception groups of higher rank, are indicated. (8 refs.)

64722 Representation of quantum mechanical wavefunctions by transformation generators. II. One-dimensional time-dependent case. C.Jung, H.Kruger (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
J. Phys. A (GB), vol.16, no.7, p.1397-408 (11 May 1983).
For pt.I see ibid., vol.16, no.11, p.3509-23 (1982). Sufficient conditions are given for constructing quantum mechanical wavefunctions by the sole knowledge of an appropriate sequence of classical canonical transformations which map a given Hamiltonian onto the new position variable. The transformation kernel for each individual step of this sequence is given by the semiclassical limit expression; it is a function of the generator of this transformation step only. The transformation kernel for the total transformation and the time-dependent wavefunction are obtained as a multiple integral over the product

of the transformation kernels of the various intermediate steps. The practicability of this procedure is demonstrated by several examples. The authors consider explicitly time-dependent systems with one degree of freedom. (10 refs.)

64723 Laplace transform method for scattering on Coulomb plus nonlocal separable potentials. D.K.Ghosh, M.R.Sinha, B.Talukdar (Dept. of Phys., Visva-Bharati Univ., Santiniketan, India).

J. Phys. A (GB), vol.16, no.7, p.1529-37 (11 May 1983).

A Laplace transform method is derived to solve the Schrodinger equation for the Coulomb plus Tabakin potentials with the regular boundary condition. The results are used to construct expressions for on- and off-shell Jost functions in terms of Gaussian hypergeometric functions. (20 refs.)

64724 The accidental degeneracy problem in nonrelativistic quantum mechanics. A.Khare (Dept. of Theoretical Phys., Univ. of Manchester, Manchester, England).

J. Math. Phys. (USA), vol.24, no.4, p.867-73 (April 1983).

The author shows that the class of potential given by $V(r)=Ar^{2d-2}-Br^{d-2}$ possesses partial accidental degeneracy given by $E_{n1,l2}=E_{n2,l1}$ in case $d=(l_2=l_1)/(n_2-n_1)$, $B=[l+dn+(1-d)/2]\times(2A/\mu)^{1/2}$. It is further shown that, for a given potential, as the number of dimensions change, the accidential degeneracy pattern also changes except when $d=1$ and 2. Using these results, it is then shown that for the bottom quark-antiquark ($b\bar{b}$) bound system, most likely $E_{3S}<E_{1F}<E_{2D}$. Finally he also makes some conjectures about the ordering of levels for a wide class of potentials. (10 refs.)

64725 Remarks on canonical transformations in phase-space path integrals. C.C.Gerry (Div. of Sci. & Math., Univ. of Minnesota, Morris, MN, USA).

J. Math. Phys. (USA), vol.24, no.4, p.874-7 (April 1983).

The author studies canonical transformations in phase-space path integrals in the Schrodinger representation. Using the example of a contact transformation implemented in each short-time propagator via the midpoint method, he shows that the 'measure' $(dp_N/2\pi\hbar)\Pi_{j=1}{}^{N}\ [dp_jdq_j/(2\pi\hbar)]$, apart from the unpaired dp_N, cannot be considered as a product of Liouville measures. (14 refs.)

64726 A recurrence relation for the phase shifts of exponential and Yukawa potentials. B.G.Sidharth (Scuola Internazionale Superior di Studi Avanzati, Trieste, Italy).

J. Math. Phys. (USA), vol.24, no.4, p.878-82 (April 1983).

Using the Born approximation for high energies, the author deduces a recurrence relation for the higher order phase shifts Yukawa and exponential potentials and their superpositions. Thence a formula for the total cross section is deduced. It is shown that these formulae are particularly useful when the energy is very high. Next, using the low energy technique of expansion in powers of the energy, the author deduces an asymptotic formula when l is large, for δ_{l+1}/δ_l. The remarkable thing is that the recurrence relation is identical to the asymptotic formula. It is verified that the formulae for the phase shifts give satisfactory results, which are better than the Born approximation, from $l=1$ onwards, for scattering by helium and hydrogen atoms, while the formula for the total cross section gives better results than an improved variational technique or the Born approximation. (12 refs.)

64727 Time evolution kernels: uniform asymptotic expansions. T.A.Osborn (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada), Y.Fujiwara.

J. Math. Phys. (USA), vol.24, no.5, p.1093-103 (May 1983).

For a wide class of self-adjoint Schrodinger Hamiltonians, a detailed description of the time evolution kernel is obtained. In a setting of a d-dimensional Euclidean space without boundaries, the Schrodinger Hamiltonian H is the sum of the negative Laplacian plus a real-valued local potential $v(x)$. The class of potentials studied is the family of bounded and continuous functions that are formed from the Fourier transforms of complex bounded measures. These potentials are suitable for the N-body problem, since they do not necessarily decrease as $|x|\to\infty$. An asymptotic expansion in the complex parameter z, around $z=0$, is derived for the family of kernels $U_z(x,y)$ corresponding to the analytic semigroup $\{e^{-zH}:\mathrm{Re}\ z>0\}$, which is uniform in the coordinate variables x and y. The asymptotic expansion has a simple semiclassical interpretation. Furthermore, an explicit bound for the remainder term in the asymptotic expansion is found. The expansion and the remainder term bound continue to the time axis boundary $z=it/\hbar(t\neq0)$ of the analytic semigroup domain. (20 refs.)

64728 Time evolution of the Wigner function. F.Soto-Eguibar, P.Claverie (Lab. de Chimie Quantique, Inst. de Biologie Phys.-Chimique, Paris, France).

J. Math. Phys. (USA), vol.24, no.5, p.1104-9 (May 1983).

The authors give a partial answer to the problem: when does an initially non-negative Wigner function remain non-negative under the effect of the time evolution? They show that, for pure states, this is the case for linear systems only; to prove this they use the fact that the Wigner function is non-negative if and only if the wavefunction is Gaussian. The authors also prove that the Green's solution of the evolution equation of the Wigner function, which in the framework of probability theory corresponds to the conditional probability density, takes on negative values. They utilize a theorem, about moments, borrowed from Pawula (1965, 1967). They conclude that the Wigner phase-space formulation of quantum mechanics cannot receive a genuine probabilistic interpretation. (17 refs.)

64729 Transfer matrices for one-dimensional potentials. A.Peres (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).

J. Math. Phys. (USA), vol.24, no.5, p.1110-19 (May 1983).

The one-dimensional Schrodinger equation can be written as a first-order multicomponent equation by considering ψ and $d\psi/dx$, or combinations thereof, as independent variables. A potential barrier is then represented by a matrix belonging to one of the homomorphic groups SU(1,1), SO(2,1), Sp(2,R), or SL(2,R). The relationship between these groups is clarified. In various applications, one of them may turn out more convenient than others. In particular, SO(2,1), which is obtained by using as a basis some bilinear combinations of ψ and $d\psi/dx$, leads to remarkable results: the Schrodinger wavefunction is represented by a trajectory on a unit hyperboloid; a periodic potential corresponds to a pseudorotation around a fixed axis; a random potential gives a random walk on the hyperboloid. This method can also be used to calculate bound states (in potential wells) and may have many other interesting applications. (26 refs.)

64730 A probabilistic formulation of quantum theory. III. T.Wenning, A.Bach (Inst. fur Theoretische Phys., Univ. Munster, Munster, Germany).

J. Math. Phys. (USA), vol.24, no.5, p.1120-2 (May 1983).

For pt.II see ibid., vol.23, p.1078 (1982). A representation of the expectation value of quantum mechanics, which recently has been set up for normal states, is generalized to singular states. It is shown that states can be represented by finitely additive measures on the state space, which are σ-additive if and only if the states are normal. (10 refs.)

64731 · Nonlinear time-dependent anharmonic oscillator: asymptotic behavior and connected invariants. D.Besnard, J.R.Burgan, A.Munier (CEA Limeil, Villeneuve St Georges, France), M.R.Feix, E.Fijalkow.

J. Math. Phys. (USA), vol.24, no.5, p.1123-8 (May 1983).

The motion of a particle in a potential decreasing with time as $|X|^n$ is considered. Different time and space rescaling are considered in order to obtain the asymptotic solutions. The validity of adiabatic invariants is discussed. The classical critical case corresponds to the obtainment of self-similar solutions for the quantum problem. (7 refs.)

64732 Complex-potential description of the damped harmonic oscillator. P.Exner (Lab. of Theoretical Phys., JINR, Dubna, USSR).

J. Math. Phys. (USA), vol.24, no.5, p.1129-35 (May 1983).

The multidimensional damped harmonic oscillator is treated by means of a non-self-adjoint Hamiltonian with complex potential. The propagator referring to the evolution semigroup is evaluated from the Lie-Trotter formula. The one-dimensional case is discussed in detail with the following results: (a) the nondamped limit gives the correct propagator including the Maslov phase factor, (b) for some initial conditions, the classical limit of the solution can differ from the behavior of the classical damped oscillator, the difference being negligible in the case of weak damping, and (c) the point spectrum of the considered pseudo-Hamiltonian is found. (32 refs.)

64733 Extended continued fractions and energies of the anharmonic oscillators. M.Znojil (Nuclear Phys. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).

J. Math. Phys. (USA), vol.24, no.5, p.1136-41 (May 1983).

The author describes the analytic solution to the Schrodinger eigenvalue problem for the class of the central potentials $V(r)=\Sigma_{\delta\epsilon Z}a_\delta r^\delta$, where $a_{-2}>-1/4$, $a_{\max\delta}>0$, Z is an arbitrary finite set of the integer or rational exponents, $-2\leq\delta_1<\delta_2<\ldots<\delta_l$, and the couplings a_δ satisfy only one auxiliary (formal, 'superconfinement') restriction of the type $a_{\delta l-1}>0$. The formalism is based on an analysis of the asymptotic behavior of the explicit regular solution $\psi(r)$ and issues in the formulation of the 'secular' equation $1/L_1(E)=0$ which determines the binding energies. The main result is the rigorous construction of $L_1(E)$ is a generalized ('extended') and convergent continued fraction. The method cannot be applied to the $a_{\delta l-1}<0$ cases—this disproves the closely related Hill-determined approach as conjectured recently by Singh et al. (1978, 1979, 1980) for the simplest potentials with $Z=\{-2,2,4,6\}$ and $Z=\{-2,-1,1,2\}$. (16 refs.)

64734 On the number of unnatural parity bound states of the H⁻ ion. H.Grosse (Inst. fur Theoretische Phys., Univ. of Wien, Wien, Austria), L.Pittner.

J. Math. Phys. (USA), vol.24, no.5, p.1142-7 (May 1983).

The authors show rigorously that the H^- ion possesses exactly one (three times degenerate) bound state in the unnatural parity sector. (12 refs.)

64735 Inverse scattering for the reflectivity function. S.H.Gray (Amoco Production Co., Tulsa, OK, USA).

J. Math. Phys. (USA), vol.24, no.5, p.1148-51 (May 1983).

An inverse method for elastic, electromagnetic, or acoustic waves in a stratified half-space is presented. Rather than transforming the wave equation to one for which quantum inverse scattering methods can be applied in solving for a potential $q(\tau)$, the author transforms to one where it is suitable to solve for a 'reflectivity function', or local reflection coefficient, $\gamma(\tau)$. The author shows that $\gamma(\tau)$ can be discontinuous, thus improving a result of Balanis (1982) and that discontinuities of $\gamma(\tau)$ match those of the impulse response $R(t)$. The author also shows the relationship between the scattering kernel of this method and the scattering kernel of the quantum inverse scattering theory. (11 refs.)

64736 The Coulomb Jost states in the momentum representation for all partial waves in closed form. H.van Haeringen (Dept. of Math., Delft Univ. of Technol., Delft, Netherlands).

J. Math. Phys. (USA), vol.24, no.5, p.1152-6 (May 1983).

The author obtains the Coulomb Jost states in the momentum representation for all l in exact closed form. These closed expressions consist of combinations of the function ${}_2F_1(1,i\gamma;\ 1+i\gamma;.)$, Jacobi polynomials, and other polynomials. The author also discusses the relation of the Coulomb Jost states with other quantities that are of interest in the theory of charged-particle scattering. (8 refs.)

64737 The unitarity relations for the off-shell Coulomb T matrix for all partial waves. H.van Haeringen (Dept. of Math., Delft Univ. of Technol., Delft, Netherlands).

J. Math. Phys. (USA), vol.24, no.5, p.1157-9 (May 1983).

By employing a recently obtained expression for the partial-wave projection of the off-shell Coulomb T matrix for all l the author proves that the unitarity relations for the Coulomb T matrix hold provided that they are properly modified with the help of Coulombian asymptotic states. (12 refs.)

64738 Existence and uniqueness of bound-state eigenvectors for some channel coupling Hamiltonians. J.W.Evans (Dept. of Chem., Iowa State Univ., Ames, IA, USA).

J. Math. Phys. (USA), vol.24, no.5, p.1160-2 (May 1983).

For the three-particle, two-cluster, 2×2 channel coupling Hamiltonians used, e.g. in $H_2{}^+$ and He bound-state calculations, the author demonstrates that typically there exist unique eigenvectors for all bound states. This result also holds, with some technical assumptions on the potentials, for the corresponding 3×3 case provided there are no spurious eigenvectors with bound-state eigenvalues. The proofs use the analogous results for the corresponding Faddeev-type Hamiltonians together with spurious multiplier relationships. (16 refs.)

64739 Off-shell T matrix for Coulomb plus simple separable potentials for all l in closed form. H.van Haeringen (Dept. of Math., Delft Univ. of Technol., Delft, Netherlands).

J. Math. Phys. (USA), vol.24, no.5, p.1274-81 (May 1983).

The author derives simple exact analytic expressions for the off-shell T matrices associated with potentials consisting of the sum of the Coulomb potential and any so-called simple separable potential, for all partial waves. Such potentials play an important role in model calculations for the description of the interaction between charged particles, e.g. protons. The author also derives some interesting properties of the Coulomb-modified form factors associated with the form factors of the separable potentials. The analytic expressions obtained are useful for theoretical and numerical applications. (12 refs.)

64740 Comment on the paper: 'Necessary conditions on potential functions for nonrelativistic bound states' by Gerald Rosen. V.Glaser, A.Martin (CERN, Geneva, Switzerland).

Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.16, p.519-20 (16 April 1983).

The authors discover that the paper of G. Rosen (1982) with the above-mentioned title contains no new result. The sufficient condition for the absence of bound state in a three-dimensional potential $\int|V|^{3/2}d^3x<3\sqrt{3}/4\pi^2$ was established in 1976 by Grosse, Thirring and by the authors and tested on various examples. A self-contained proof of the optimality of the relevant Sobolev inequality is presented by Glaer et al. (1976). The previous work of Rosen (1971) does not contain a complete proof, since spherical symmetry is postulated without the justification which is supplied by Glaser et al. and since it is only the existence of a local minimum which is established. (7 refs.)

64741 The Caldirola-Montaldi procedure and the *Q*-analysis are noncanonical theories in time. A.D.Jannussis, G.N.Brodimas, V.Papatheou, A.Leodaris (Dept. of Theoretical Phys., Univ. of Patras, Patras, Greece).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.545-50 (23 April 1983). (17 refs.)

64742 Electromagnetic binding with only zero orbital angular momentum, low-energy states. G.B.Mainland, D.M.Scott (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.198-208 (21 March 1983).
Investigates bound states of a composite system consisting of a charged particle orbiting a charged, stationary magnetic dipole. The authors find bound states with zero orbital angular momentum but, for a specific range of a parameter, they find no other states with orbital angular momentum less than eleven. The states with zero orbital angular momentum are the most tightly bound. If this mechanism were operable in a realistic composite model of leptons, it could explain why the electron, muon and tau all have spin $^1/_2$. They also suggest a mechanism which may explain the absence or suppression of the decay of a muon into an electron and a photon. Their calibration is nonrelativistic and is performed in two space dimensions. (12 refs.)

64743 Obtaining non-negative quantum mechanical distribution function. P.Bertrand, J.P.Doremus, B.Izrar, V.T.Nguyen (Lab. de Phys. Theorique, Univ. de Nancy I, Vandoeuvre, France), M.R.Feix.
Phys. Lett. A (Netherlands), vol.94A, no.9, p.415-17 (4 April 1983).
The distribution function obtained by smoothing the original Wigner function with a weighting function, is shown to be positive everywhere, if the weighting function itself is a Wigner transform of any normalised function. The marginal distribution is recovered with a special choice of this function. (16 refs.)

64744 Quantum energy-entropy balance and breaking of symmetries. M.Fannes, P.Vanheuverzwijn, A.Verbeure (Inst. voor Theoretische Fysica, Univ. Leuven, Leuven, Belgium).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.418-20 (4 April 1983).
A method, based on a general energy-entropy inequality, is presented to rule out spontaneous breaking of discrete and continuous symmetries. As an application the authors prove rigorously the homogeneity of the correlation functions for one-dimensional long-range quantum lattices. (16 refs.)

64745 Resonances and asymptotic behavior of Birkhoff series. G.Servizi, G.Turchetti (Istituto di Fisica, Univ. di Bologna, Bologna, Italy), G.Benettin, A.Giorgilli.
Phys. Lett. A (Netherlands), vol.95A, no.1, p.11-14 (11 April 1983).
For hamilton systems with two degrees of freedom a mechanism accounting for the divergence of perturbation series and the asymptotic relation between true and formal dynamics is proposed. In the special case of conservative quadratic maps numerical and analytical support is given for a piecewise geometric structure of the Birkhoff series, that is a sequence of pseudoconvergence radii is found which decreases to zero and is associated with the resonances approaching the rotation angle of the linear map. (12 refs.)

64746 Structure and stability of the quasi-energy spectrum of two interacting quantum nonlinear resonances. G.P.Berman, A.R.Kolovsky (Kirensky Inst. of Phys., Krasnoyarsk, USSR).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.15-18 (11 April 1983).
The numerical analysis of the structure and stability of the quasi-energy spectrum of two interacting quantum nonlinear resonances is carried out. It is shown that when resonances overlap and a sufficiently large number of levels participate in the dynamics of the system the quasi-energy spectrum is weakly unstable at a small variation of the parameters of the system. This leads to a strong instability of the frequency spectrum of amplitudes of the populations. (5 refs.)

64747 Comment on 'quantum nondemolition measurements'. J.D.Macomber (Chem. Dept., Univ. of Petroleum and Minerals, Dhahran, Saudi Arabia).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.19-20 (11 April 1983).
It is shown that the new term 'quantum nondemolition measurements' may be applied to a magnetic-resonance gedanken-experiment first described by the author in 1976. (5 refs.)

64748 On resolvent operators in scattering theory. S.K.Adhikari (Dept. de Fisica, Univ. Federal de Pernambuco, Recife, Brazil).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.21-2 (11 April 1983).
It is shown that, contrary to recent claims, the usual definition of resolvent operators in scattering theory is correct. (10 refs.)

64749 Chaos in a perturbed nonlinear Schrodinger equation. K.Nozaki, N.Bekki (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1226-9 (25 April 1983).
It is shown that a nonlinear Schrodinger soliton behaves stochastically with random phases in both time and space in the presence of small external oscillating fields and emits small-amplitude plane waves with random phases. Statistical properties of random phases give the energy spectra of the soliton and plane waves. (9 refs.)

64750 Some evaluations of Bell's inequality for particles of arbitrary spin. M.Ogren (Inst. of Theoretical Phys., Goteborg, Sweden).
Phys. Rev. D (USA), vol.27, no.8, p.1766-73 (15 April 1983).
Bell's inequality is applied to a gedanken experiment, where a spin singlet decays into two spin-*s* particles. This is done by defining dichotomic observables depending on the spin components. The range of settings, for which the inequality is violated by quantum mechanics is calculated for certain values of *s*. The classical limit is taken and the results are compared to those obtained, by an alternative method, by Mermin (1980). (15 refs.)

64751 Quantisation of dynamical systems and stochastic control theory. F.Guerra, L.M.Morato (Centre de Phys. Theorique, CNRS, Marseille, France).
Phys. Rev. D (USA), vol.27, no.8, p.1774-86 (15 April 1983).
In the general framework of stochastic control theory the authors introduce a suitable form of stochastic action associated to the controlled process. A variational principle gives all the main features of Nelson's stochastic mechanics. In particular, they derive the expression for the current velocity field as the gradient of the phase action. Moreover, the stochastic corrections to the Hamilton-Jacobi equation are in agreement with the quantum-mechanical form of the Madelung fluid (equivalent to the Schrodinger equation). Therefore, stochastic control theory can provide a very simple model simulating quantum-mechanical behaviour. (34 refs.)

64752 Improved semiclassical approximation. A.Patrascioiu (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1798-802 (15 April 1983).
A modification of the semiclassical method, applicable in massless theories, is proposed. It is shown that in 0 and 1 dimensions this approximation produces excellent numerical agreement with the exact or otherwise-computed results. The generalisation to higher dimensions is discussed. (11 refs.)

64753 Planar rotor: The θ-vacuum structure, and some approximate methods in quantum mechanics. M.Asorey (Dept. de Fisica Teorica, Univ. de Zaragoza, Zaragoza, Spain), J.G.Esteve, A.F.Pacheco.
Phys. Rev. D (USA), vol.27, no.8, p.1852-68 (15 April 1983).
The quantum planar rotor is chosen as a model to test different approximate techniques, emphasizing the analogies between this simple system and the non-Abelian quantum gauge field theories (instantons, θ vacuum, etc.). In particular, variational and perturbative methods, path-integral techniques, and Monte Carlo simulations are applied. It is pointed out that the maximal destructive interference between instantons takes place in the θ-vacuum realization of the interacting rotor system with $\theta=1/2$, where the tunneling effects are shown to be severely diminished. (20 refs.)

64754 Potential scattering at high energy: Gaussian potential. T.W.Chen (California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1869-77 (15 April 1983).
A new formula for the elastic scattering amplitude by a potential is found. It is based on the usual eikonal-approximation scheme except that the linearized propagation in the scattering region is chosen to be along the average direction of the initial and final momenta at every step of the derivation. The projectile thus moves in a classical-refraction trajectory. The new formula is tested numerically for Gaussian potentials. It is found to work remarkably well for a wide range of angles. (7 refs.)

64755 A nonlocal equation for the wave function of the harmonic oscillator when the position spectrum is to be made discrete. R.G.Campos (Escuela de Fisico-Matematicas, Univ. Michoacana de San Nicolas de Hidalgo, Morelia, Mexico).
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.217-36 (Feb. 1983).
A discrete spectrum for position and a nonlocal equation for the wave function with its respective solutions are obtained, in a trivial way, by replacing the usual position and momentum operators by finite matrices, obtained by truncating the infinite matrices for these operators in the energy representation. Some extremal properties of the energy eigenfunctions and of the position eigenvalues are shown. (7 refs.)

64756 Construction of effective operators for the time-dependent Schrodinger equation. V.I.Zakharov, Vl.G.Tyuterev (Inst. of Atmospheric Optics, Acad. of Sci., USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.749-52 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.78-81 (Aug. 1982). [received: April 1983]
The contact transformation method is used to solve the time-dependent Schrodinger equation describing the behavior of a multilevel system in a resonance electromagnetic field. A solution not containing secular terms is obtained for the evolution operator in the interaction representation U_0. The derivation of the equation for the probability of the simultaneous absorption of two photons with the dipole interaction is presented as an example of the effectiveness of the obtained solution. (6 refs.)

64757 Influence of an abrupt drop in potential on particle motion. S.B.Nurmagambetov (S.M. Kirov Polytech. Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.676-80 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.102-6 (July 1982). [received: May 1983]
The motion of particles in potentials which become minus infinity at some point has been investigated. It is shown that the state localized at the point of the potential drop is the ground state of the particle; for excited states, whose wave functions do not vanish at the point where the potential drops, the fairly abrupt potential drop is equivalent to the existence of a potential barrier at that point. (3 refs.)

64758 Momentum, energy and entropy in the complex continued Schrodinger configuration plane. J.G.Gilson (Dept. of Appl. Math., Queen Mary Coll., London, England).
Speculations Sci. & Technol. (Switzerland), vol.6, no.1, p.45-54 (April 1983).
The author constructs a classical fluid alternative to conventional Schrodinger quantum theory. The equations of conservation for momentum, energy and entropy over the complex continued configuration plane are all obtained with their appropriate source functions. It is shown how all these source functions are derivable from the fundamental source function for local mass production, Γ. (11 refs.)

64759 Path integrals in problems with boundaries. L.V.Prokhorov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.14-20 (Feb. 1983). In Russian.
The problem of a particle in the n-dimensional box is considered using the path integral method. The general form of solution has been found. (8 refs.)

64760 Dirichlet and Von Neumann basis set for quantum mechanical anharmonic oscillators. A.M.Meson, F.M.Fernandez, E.A.Castro (Seccion Quimica Teorica, INIFTA, La Plata, Argentina).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.473-6 (April 1983).
It is shown that accurate upper and lower bounds to the eigenvalues of anharmonic oscillators can be obtained by means of the Rayleigh-Ritz variational method and two trigonometric basis sets of functions which satisfy Dirichlet and Von Neumann boundary conditions. Numerical results show that the Dirichlet basis set is more appropriate than the harmonic oscillator one for calculating eigenvalues and the value of eigenfunctions at the origin. (12 refs.)

64761 Finite element interpolation error bounds with applications to eigenvalue problems. P.Arbenz (Inst. fur Angewandte Math., Univ. Zurich, Zurich, Switzerland).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.180-91 (March 1983).
Optimal finite element interpolation error bounds are presented for piecewise linear, quadratic and Hermite-cubic elements in one dimension. These bounds can be used to compute upper and lower bounds for eigenvalues of second and fourth order elliptic problems. Numerical computations demonstrate the usefulness of the theoretical results. (17 refs.)

64763 On the structure of space-time caustics. K.Rosquist (Dept. of Appl. Math., Queen Mary Coll., London, England).
Commun. Math. Phys. (Germany), vol.88, no.3, p.339-55 (March 1983).
Caustics formed by timelike and null geodesics in a space-time M are investigated. Care is taken to distinguish the conjugate points in the tangent space (T-conjugate points) from conjugate points in the manifold (M-conjugate points). It is shown that most nonspacelike conjugate points having the same degree of degeneracy. The regular timelike T-conjugate locus is shown to be a smooth 3-dimensional submanifold of the tangent space. Analogously, the regular null T-conjugate locus is shown to be a smooth 2-dimensional submanifold of the light cone in the tangent space. The smoothness properties of the null caustic are used to show that if an observer sees focusing in all directions, then there will necessarily be a cusp in the caustic. If, in addition, all the null conjugate points have maximal degree of degeneracy (as in the closed Friedmann-Robertson-Walker universes), then the space-time is closed. (14 refs.)

64764 Gravitational field equations based on Finsler geometry. G.S.Asanov (Dept. of Theoretical Phys., Moscow State Univ., Moscow, USSR).
Found. Phys. (USA), vol.13, no.5, p.501-27 (May 1983).
The Finslerian generalisation of the gravitational field equations is developed on the basis of the complete contraction $K=K_{ij}{}^{ij}$ of the Finslerian curvature tensor $K_i{}^j{}_{hk}(x, y)$. The relevant Lagrangian is constructed by the replacement of the directional variable y^i in K by a vector field $y^i(x)$, so that the notion of osculation may be regarded as the key concept on which the approach is based. The introduction of the auxiliary vector field $y^i(x)$ is shown to be of physical significance, for the field equations refer not only to the proper field variables but also to a special coordinate system associated with $y^i(x)$ through the Clebsch representation of the latter. The status of the conservation laws proves to be similar to that in the theory of the Yang-Mills field. By choosing a special Finslerian metric function the authors elucidate in detail the structure of the field equations in the static case. (15 refs.)

64765 A fundamental quadratic variational principle underlying general relativity. W.K.Atkins (Dept. of Phys., North Carolina State Univ., Raleigh, NC, USA).
Found. Phys. (USA), vol.13, no.5, p.545-52 (May 1983).
The fundamental result of Lanczos (1962) is used in a new type of quadratic variational principle whose field equations are the Einstein field equations together with the Yang-Mills type equations for the Riemann curvature. Additionally, a spin-2 theory of gravity for the special case of the Einstein vacuum is discussed. (28 refs.)

64766 Black holes and the stability of gravitation. G.T.Horowitz (Inst. for Advanced Study, Princeton, NJ, USA), M.J.Perry.
Gen. Relativ. & Gravitation (USA), vol.15, no.1, p.1-5 (Jan. 1983).
The existence of black holes in general relativity provides an effective cutoff to the negative gravitational potential. This results in a fundamental upper limit on the amount of energy that can be radiated away by any isolated system. (11 refs.)

64767 Novikov-type coordinates for HJ separable metrics. S.Gupta, N.Mitskievic (Dept. of Theoretical Phys., Patrice Lumumba Peoples' Friendship Univ., Moscow, USSR).
Gen. Relativ. & Gravitation (USA), vol.15, no.1, p.7-19 (Jan. 1983).
Synchronous frames are known to remove (at least partially) deficiencies inherent in Killing coordinates. Strangely enough, no constructive general method of finding these frames has been formulated, though it follows from the definition of synchronous coordinates. The authors propose here such a method and apply it to the Kerr metric to obtain a Novikov-type synchronous frame. The removal of nonphysical singularities is discussed in the context of 3-metric and 3-curvature on the spatial hypersurfaces in this frame. (14 refs.)

64768 The topology of geodesically complete space-times. C.W.Lee (Dept. of Math., Bolton Inst. of Technol., Bolton, England).
Gen. Relativ. & Gravitation (USA), vol.15, no.1, p.21-30 (Jan. 1983).
Two theorems are given on the topology of geodesically complete space-times which satisfy the energy condition. Firstly, the condition that a compact embedded 3-manifold in space-time be dentless is defined in terms of causal structure. Then it is shown that a dentless 3-manifold must separate space-time, and that it must enclose a compact portion of space-time. Further, it is shown that if the dentless 3-manifold is homeomorphic to S^3 then the part of space-time that it encloses must be simply connected. (16 refs.)

64769 The equivalence of perfect fluid space-times and magnetohydrodynamic space-times in general relativity. B.O.J.Tupper (Dept. of Math. & Statistics, Univ. of New Brunswick, Fredericton, New Brunswick, Canada).
Gen. Relativ. & Gravitation (USA), vol.15, no.1, p.47-64 (Jan. 1983).
It is shown that perfect fluid space-times can also satisfy the field equations for a magnetohydrodynamic fluid. The necessary conditions for this equivalence are found and the magnetohydrodynamic interpretations of the zero-curvature FRW model with equation of state $\rho=3p$, and of the Godel model are given. (5 refs.)

64770 Perfect fluid spheres in general relativity. D.C.Srivastava, S.S.Prasad (Dept. of Phys., Univ. of Gorakhpur, Gorakhpur, India).
Gen. Relativ. & Gravitation (USA), vol.15, no.1, p.65-77 (Jan. 1983).
Spherically symmetric perfect fluid distributions in general relativity have been investigated under the assumptions of (i) uniform expansion or contraction and (ii) the validity of an equation of state of the form $p=p(\rho)$ with nonuniform density. An exact solution which is equivalent to a solution found earlier by Wyman (1946) is obtained and it is shown that the solution is unique. The boundary conditions at the interface of fluid distribution and the exterior vacuum are discussed and as a consequence the following theorem is established: Uniform expansion or contraction of a perfect fluid sphere obeying an equation of state with nonuniform density is not admitted by the field equations. It is further shown that the Wyman metric is not suitable on physical grounds to represent a cosmological solution. (10 refs.)

64771 Scalar-tensor theory of gravitation: generalizations and experimental limitations. J.P.Duruisseau (Dept. de Mecanique, Univ. Pierre et Marie Curie, Paris, France).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.285-92 (April 1983).
Several theories with scalar field can be derived from different variational principles. The author considers a very general variational principle and proves that, in the exterior case without electromagnetic field, the solution for a particular case generates the set of solutions for the general case. This is applied to the exterior solution in the static case with spherical symmetry without electromagnetic field. The author investigates the predictions for the classical effects and the event horizons. (19 refs.)

64772 Conformal flat interior solutions for a charged sphere. Zhu Shi-chang (Dept. of Phys., Shanghai Teachers Coll., Shanghai, China).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.293-303 (April 1983).
The author has obtained conformal flat interior solutions of the Einstein-Maxwell equations for a charged stable static sphere. These solutions satisfy physical conditions inside the sphere. (12 refs.)

64773 Nonstatic solutions for the repulsive massless scalar field Einstein equation. H.Ishikawa (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.305-7 (April 1983).
The author presents exact nonstatic solutions for the coupled repulsive sourceless massless scalar field and the gravitational field. The solutions have the same form as the spatially conformally flat static metric $ds^2=-e^{2\psi}dt^2+e^{-2\psi}(dx^2+dy^2+dz^2)$. (3 refs.)

64774 Classical and quantum models of strong cosmic censorship. V.E.Moncrief (Dept. of Phys., Yale Univ., New Haven, CT, USA).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.309-14 (April 1983).
The cosmic censorship conjecture states that naked singularities should not evolve from regular initial conditions in general relativity. In its strong form the conjecture asserts that space-times with Cauchy horizons must always be unstable and thus that the generic solution of Einstein's equations must be inextendible beyond its maximal Cauchy development. The author shows that one can construct an infinite-dimensional family of extendible cosmological solutions similar to a Taub-NUT space-time. (7 refs.)

64775 Space-time in ordered electromagnetic radiation outside a massive plane. P.A.Amundsen, O.Gron (Inst. of Phys., Univ. of Oslo, Oslo, Norway).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.315-19 (April 1983).
The Einstein-Maxwell equations are solved with an energy-momentum tensor corresponding to the field of a standing electromagnetic wave outside a massive plane, in the limit where the test particle is much larger than the wavelength of the electromagnetic field. Physical properties of the solution are discussed. (10 refs.)

64776 Geometrical mass of charged particle in Brans-Dicke theory. M.M.Som, N.S.Santos (Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.321-8 (April 1983).
The authors develop a special class of solutions of the Brans-Dicke equations from vacuum solutions of Einstein's equations by applying a method due to Teixeira, Wolk, and Som. It is shown that the electric charge contributes positively to the geometric mass while the Brans-Dicke scalar field diminishes the geometric mass effectively. (4 refs.)

64777 Remark concerning spherically symmetric nonstatic solutions to the Einstein equations in the comoving frame. K.Lake (Dept. of Phys., Queen's Univ. Kingston, Kingston, Ontario, Canada).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.357-61 (April 1983).
All nonstatic spherically symmetric fluid solutions to the Einstein equations in the comoving frame $ds^2=e^{\lambda(r,t)}dr^2\ e^{\mu(r,t)}d\Omega^2-e^{\nu(r,t)}dt^2$ are found subject to the conditions: (i) $\dot{\lambda}=A\dot{\mu}$, A=const, (ii) λ, μ, and ν are separable functions of r and t, (III) the heat flux vanishes, and (iv) the coefficient of shear viscosity vanishes. There are but two classes of solutions: (i) $A=1$, in which case the metric reduces to the Robertson-Walker form, and (ii) $A=0$, in which case there are four solutions, all with nonvanishing acceleration, expansion, and shear. With $A=0$, the solutions are either singular at the origin or degenerate into spaces of constant curvature. (2 refs.)

64778 Third-order tensor potentials for the Riemann and Weyl tensors. F.Bampi, G.Caviglia (Istituto Matematico, Univ. de Genova, Genova, Italy).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.375-86 (April 1983).
The representations of the Riemann and the Weyl tensors of a four-dimensional Reimannian manifold through covariant derivatives of third-order potentials are examined in detail. The Weyl tensor always admits a completely general representation whereas the Riemann tensor does not. Nevertheless there exists a class of Riemannian manifolds whose Riemann tensors may be calculated in terms of potentials; in this connection, specific examples are exhibited explicitly. The possibility of introducing gauges on the potentials is reexamined in connection with the previous result. New properties of the representations are also discussed. (13 refs.)

64779 Momentum, angular momentum and their quasi-local null surface extensions. M.Ludvigsen, J.A.G.Vickers (Dept. of Math., Univ. of York, York, England).
J. Phys. A (GB), vol.16, no.6, p.1155-68 (21 April 1983).
Let M be an asymptotically flat space-time which satisfies the dominant energy condition and let $\mathcal{N}$ be a null hypersurface of M which meets $\mathscr{I}^+$ in a space-like cross section S given by $r=\infty$, where r is an affine parameter along the generators of $\mathcal{N}$. It is shown that there exists a quasi-local momentum $P_a(r)$, defined by means of an integral over the r=constant cross sections

of $\mathcal{N}$, which tends to the Bondi momentum as $r \to \infty$, and which satisfies the radial 'mass-gain condition' $P_a(r_2)k^a \geq P_a(r_1)k^a$ when $r_2 \geq r_1$, where k^a is a constant future pointing null vector. This condition is then used to show that, in certain circumstances, the Bondi momentum is always future pointing or, in other words, that the Bondi mass is always positive. A quasi-local angular momentum is also defined, which tends to Bramson's (1975) angular momentum as $r \to \infty$. (12 refs.)

64780 An inequality relating mass and electric charge in general relativity. M.Ludvigsen (Dept. of Math., Univ. of Canterbury, Christchurch, New Zealand), J.A.G.Vickers.

J. Phys. A (GB), vol.16, no.6, p.1169-74 (21 April 1983).

The authors show that the total mass and electric charge of an isolated gravitating system satisfy the inequality $m \geq |e|$, provided all matter eventually becomes enclosed within a single trapped surface. (7 refs.)

64781 Colliding plane gravitational and electromagnetic waves. J.B.Griffiths (Dept. of Math., Loughborough Univ. of Technol., Loughborough, England).

J. Phys. A (GB), vol.16, no.6, p.1175-80 (21 April 1983).

A new class of type-II Einstein-Maxwell fields is presented. These describe the space-time subsequent to a collision of a gravitational wave with an electromagnetic wave. The gravitational wave is an arbitrary pp wave with generally non-constant polarisation. The incoming electromagnetic wave is also an arbitrary pp wave, and it is shown that this is partially reflected by the gravitational wave. (18 refs.)

64782 Left-flat spaces with non-diverging null geodesics. G.Ludwig (Dept. of Math., Univ. of Alberta, Edmonton, Alberta, Canada).

J. Phys. A (GB), vol.16, no.6, p.1181-9 (21 April 1983).

One of the two classes of non-divering algebraically special left-flat spaces found by Fette, Janis and Newman (1977) is generalised by allowing the (self-dual part of the) Weyl tensor to become algebraically general. Penrose's conformal approach is used, thereby allowing the desired asymptotic behaviour of the solutions to be prescribed from the outset. The 'solutions' are, however, still subject to some 'reduced equations'. For a specific choice of initial data at conformal null infinity these reduced equations simplify to Plebanski's (1975) second heavenly equation. (10 refs.)

64783 Wormhole solutions in Einstein-Yang-Mills-Higgs system. II. Zero-order structure for $\mathcal{G}$=SU(2). P.Hajicek (Inst. for Theoretical Phys., Univ. of Bern, Bern, Switzerland).

J. Phys. A (GB), vol.16, no.6, p.1191-205 (21 April 1983).

For pt.I see Bern Report BUTP-20 (1982). For a simple Einstein-Yang-Mills Higgs model, the author studies properties of the extreme wormhole solutions. As shown in a recent paper (1982), the values of all fields at the boundary of the hole must satisfy a system of differential equations. The author finds solutions to this system in a number of cases, among others a non-abelian family similar to the 't Hooft-Polyakov monopole. The author also proves that all solutions must be axisymmetric, and conjecture that the set of solutions which the author has found is already complete. (2 refs.)

64784 On the relativistic dynamics of spinning matter in space-time with curvature and torsion. A.V.Minkevich, F.Karakura (Dept. of Phys., Byelorussian State Univ., Minsk, Byelorussian SSR).

J. Phys. A (GB), vol.16, no.7, p.1409-18 (11 May 1983).

A variational formalism is developed for conservative systems with internal degrees of freedom in a space-time with curvature and torsion. Lagrange's translational and rotational equations of motion are obtained as well as expressions for the energy-momentum and spin angular momentum tensors; Noether's identities are derived. Some properties of the developed formalism are studied in greater detail. (15 refs.)

64785 Minimal surfaces, spatial topology and singularities in space-time. G.J.Galloway (Dept. of Math., Univ. of Miami, Coral Gables, FL, USA).

J. Phys. A (GB), vol.16, no.7, p.1435-9 (11 May 1983).

Using an approach first advocated by Gannon (1975, 1976) and recent results of Meeks, Simon and Yau (1982) on the existence of compact minimal surfaces some new results are obtained relating non-trivial spatial topology to the occurrence of singularities in space-time. For example, it is shown that if V^3 is a contracting body with mean-convex boundary homeomorphic to a two-sphere in a space-time M^4 obeying appropriate curvature and causality assumptions, then either V^3 is a three-cell or M^4 is non-space-like geodesically incomplete. (9 refs.)

64786 Nonlinear Lagrangians and pp waves. H.A.Buchdahl (Dept. of Theoretical Phys., Faculty of Sci., Australian Nat. Univ., Canberra, ACT, Australia).

J. Phys. A (GB), vol.16, no.7, p.1441-7 (11 May 1983).

From time to time modifications of Einstein's general theory of relativity have been considered the central feature of which, on a formal level, is the appearance in place of the Einstein Lagrangian R of a more general Lagrangian L. On physical grounds one will require L to differ from R only by terms whose presence has no substantial observational consequences under 'ordinary' conditions. No non-trivial exact vacuum solutions of the equations generated by any such Lagrangian appear to be known, the Schwarzschild metric being regarded as a 'trivial solution' in this context. The author considers pp waves, first as exact solutions of the vacuum equations generated by a family of inhomogeneous quadratic Lagrangians L^*. Thereafter a much wider class of Lagrangians is contemplated, but the greater generality of this is only apparent since all such Lagrangians in effect reduce to L^*. (15 refs.)

64787 . A coordinate-free derivation of a generalized geodesic deviation equation. N.S.Swaminarayan (Dept. of Math., Chelsea Coll., Univ. of London, London, England), J.L.Safko.

J. Math. Phys. (USA), vol.24, no.4, p.883-5 (April 1983).

A simple, coordinate-free exact derivation of the geodesic deviation equation is given. This result includes the possibility of nonvanishing torsion. The authors then show that this form of the geodesic deviation equation can be specialized to various results given previously in the literature. (16 refs.)

64788 The general theory of *R*-separation for Helmholtz equations. E.G.Kalnins (Math. Dept., Univ. of Waikato, Hamilton, New Zealand), W.Miller,Jr..

J. Math. Phys. (USA), vol.24, no.5, p.1047-53 (May 1983).

The authors develop the theory of R-separation for the Helmholtz equation on a pseudo-Riemannian manifold (including the possibility of null coordinates) and show that it, and not ordinary variable separation, is the natural analogy of additive separation for the Hamilton-Jacobi equation. They provide a coordinate-free characterization of variable separation in terms of commuting symmetry operators. (12 refs.)

64789 The multipole structure of stationary space-times. W.Simon, R.Beig (Inst. fur Theoretische Phys., Univ. Wien, Wien, Austria).

J. Math. Phys. (USA), vol.24, no.5, p.1163-71 (May 1983).

A definition of multipole moments for stationary asymptotically flat solutions of Einstein's equations is proposed. It is shown that these moments characterize a given space-time uniquely. Conversely, they can be arbitrarily prescribed, i.e. they generate power series for the field variables which satisfy the field equations to all orders. Despite their apparently rather different origin, they are shown to be identical with the Geroch-Hansen ones. (20 refs.)

64790 Compatibility of rigid motions with the relativistic incompressibility condition. V.Del Olmo, J.Olivert (Dept. de Mecanica y Astron., Facultad de Matematicas, Valencia, Spain).

J. Math. Phys. (USA), vol.24, no.5, p.1172-81 (May 1983).

The compatibility of the hypoelastic-Synge (isotropic case) and hypoelastic-Carter and Quintana (fully isotropic case) almost-thermodynamic material schemes with the relativistic incompressibility condition given by Ferrando and Olivert, is analyzed. The behavior of those schemes in Born-rigid motion is also studied and an additional stipulation is joined to the Born rigidity concept. This requisite leads to the vanishing of the relativistic stress tensor spatial variation and, in hypoelastic-Carter and Quintana and hypoelastic-Maugin almost-thermodynamic material schemes, leads to the absence of mechanical power originated by internal rotation. The rigidity definition that is proposed remains valid for more general almost-thermodynamic material schemes, as far as the compatibility with the incompressibility condition quoted above is concerned. (15 refs.)

64791 Rotating hollow cylinders: general solution and Machian effects. F.Embacher (Inst. fur Theoretische Phys., Univ. Wien, Wien, Austria).

J. Math. Phys. (USA), vol.24, no.5, p.1182-6 (May 1983).

The general solution of the exact gravitational field of a rotating hollow cylinder is derived. It is more general than the solution found by E. Frehland (1972). Machian effects are considered. (15 refs.)

64792 A simplified derivation of the Geroch group in two-dimensional reduced gravity. Yong-Shi wu (Inst. for Advanced Study, Princeton, NJ, USA), Mo-Lin ge.

J. Math. Phys. (USA), vol.24, no.5, p.1187-92 (May 1983).

By generalizing the authors' previous treatment of hidden symmetry in two-dimensional chiral models, a simple and explicit approach is proposed to the Geroch group for the vacuum Einstein equations with the metric tensor depending only on two variables ('two-dimensional reduced gravity'). An infinite number of infinitesimal transformations for the metric tensor preserving the equations of motion are summarized by an explicit parametric transformation and the commutators among them are calculated in a simple and straightforward way. These transformations and their group structure are further identified to be those of the well-known Geroch group. (12 refs.)

64793 Limiting density of matter as a universal law of nature. M.A.Markov (Inst. of Nuclear Res., Acad. of Sci., USSR).

JETP Lett. (USA), vol.36, no.6, p.265-7 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.214-16 (20 Sept. 1982). [received: April 1983]

It is suggested that the density of matter in nature is always less than or equal to a certain value ρ_q, which is constructed from universal constants: $\rho_q = c^5/\kappa^2\hbar \sim 10^{94}$ g/cm^3. As an example, a modified Einstein equation is derived, which, at a low density of matter, $\rho \ll \rho_q$, turns out to be a canonical Einstein equation without the Λ term. With $\rho = \rho_q$, the equations describe a de Sitter Universe. (5 refs.)

64794 Closed form for Van Stockum interior solution of Einstein's equations. J.N.Islam (Dept. of Math., City Univ., London, England).

Phys. Lett. A (Netherlands), vol.94A, no.9, p.421-3 (4 April 1983).

The author finds a closed form for the Van Stockum interior solution of Einstein's equations representing rigidly rotating dust. The part of the solution which is regular on the rotation axis is expressed in terms of an arbitrary function of one variable. An expression for the solution is obtained near the axis of rotation and an explicit particular solution is presented. It is noted that a similar procedure can be followed for the author's rigidly rotating charged dust solution. (5 refs.)

64795 Non-existence of the Reissner-Nordstrum repulsion in general relativity. O.Gron (Inst. of Phys., Univ. of Oslo, Oslo, Norway).

Phys. Lett. A (Netherlands), vol.94A, no.9, p.424-6 (4 April 1983).

The radial motion of a free neutral test particle in the Reissner-Nordstrom space-time is studied. It is shown that when the contribution of the electrical energy to the mass of the central body is properly taken account of, there is no repulsion of the test particle inside the inner horizon of the space-time. (10 refs.)

64796 Solutions to the general-relativistic Tolman-Wyman equation. P.G.Whitman (Univ. of Southwestern Louisiana, Lafayette, LA, USA).

Phys. Rev. D (USA), vol.27, no.8, p.1722-7 (15 April 1983).

The Tolman-Wyman equation is considered and regular solutions are given. A generalisation procedure is developed whereby known solutions for static metrics can be used as particular integrals of the Tolman-Wyman equation. This leads to new interiors for which the equation of state is not completely independent of that belonging to the original metric. A differential relation connecting the two sets of thermodynamic functions is given. A number of metrics are also presented for which the particular integral is not known a priori. The new interiors discussed here contain the only known nonpathological general solutions to the Tolman-Wyman equation. (9 refs.)

64797 Static plane-symmetric scalar fields with a traceless energy-momentum tensor in general relativity. A.N.Vaidya, M.M.Som (Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).

Phys. Rev. D (USA), vol.27, no.8, p.1728-30 (15 April 1983).

The problem of zero-mass scalar fields coupled to the gravitational field in the static plane-symmetric case is completely solved for a traceless energy-momentum tensor. (3 refs.)

64798 General static plane-symmetric solutions of the Einstein-Maxwell equations. P.A.Amundsen, O.Gron (Inst. of Phys., Univ. of Oslo, Oslo, Norway).

Phys. Rev. D (USA), vol.27, no.8, p.1731-9 (15 April 1983).

A general form of the metric in a space-time with nonvanishing cosmological constant outside a massive, electrically charged plane of infinite extension is found as a solution of the Einstein-Maxwell field equations. The general solution is new, but it includes several well-known solutions corresponding to special physical cases. Also, the general form of the authors' solution makes it possible easily to identify different metrics corresponding to equivalent space-times. Physical properties of the solution are discussed. The plane-symmetric universe analogous to the spherically symmetric de Sitter Universe is found separately, since it is not included in the general solution. (85 refs.)

64799 Weyl tensor as a conformal mapping criterion. Ya.I.Pugachev (Kubanskii State Univ., USSR).

Sov. Phys. J. (USA), vol.25, no.7, p.666-9 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.92-5 (July 1982). [received: May 1983]

The nonequivalence of the Weyl tensor and the conformal correspondence as conformal mapping criteria for Riemann spaces is established in a previous paper (1977). It is proved rigorously by an example of a space of constant De Sitter curvature that the disappearance of the Weyl tensor is a necessary but not sufficient condition for conformal mapping. (3 refs.)

64800 Linear Einstein equations. III. A.N.Temchin.
Sov. Phys. J. (USA), vol.25, no.7, p.669-80 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.95-8 (July 1982). [received: May 1983]
For pt.II, see Sov. Phys. J. (USA), vol.25, no.4, p.293 (1982) or Izv. VUZ. Fiz. (USSR), vol.25, no.4, p.3 (1982). The Cauchy problem for equations of the theory of gravitation, linearized around the non-Galilean metric $g_{(0)\alpha\beta}$, can have a nonunique solution. (3 refs.)

64801 Positive mass theorems for black holes. G.W.Gibbons, S.W.Hawking (DAMTP, Univ. of Cambridge, Cambridge, England), G.T.Horowitz, M.J.Perry.
Commun. Math. Phys. (Germany), vol.88, no.3, p.295-308 (March 1983).
The authors extend Witten's (1981) proof of the positive mass theorem at spacelike infinity to show that the mass is positive for initial data on an asymptotically flat spatial hypersurface Σ which is regular outside an apparent horizon H. In addition, they prove that if a black hole has electromagnetic charge, then the mass is greater than the modulus of the charge. These results are also valid for the Bondi mass at null infinity. Finally, in the case of the Einstein equation with a negative cosmological constant, they show that a suitably defined mass is positive for data on an asymptotically anti-de Sitter surface Σ which is regular outside an apparent horizon. (19 refs.)

64802 Hodge theory used to produce finite self-energy models of the electron. E.Ihrig (Dept. of Math., Arizona State Univ., Tempe, AZ, USA).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.329-46 (April 1983).
The relationship between electromagnetic fields and topology is discussed. Hodge theory is generalized to classify static fields in static wormhole models. This generalization is used to show models of the electron exist which have finite self-energy. These models always have $1/R^2$ electric fields and self-energies of $4\pi\, q^2/R_0$, where R_0 is the inner radius of the wormhole. (9 refs.)

64803 Producion of tachyons from Schwarzschild black holes. S.K.Srivastava (Government Coll., Port Blair, India).
J. Math. Phys. (USA), vol.24, no.5, p.1317-20 (May 1983).
Inside the Schwarzschild surface the line element becomes spacelike. Hence, in the present paper, the Schwarzschild black hole is considered as a spherical world of tachyons. It is assumed that tachyons are present in this world in a superdense state. In this framework a spacelike line element for this world is derived. Moreover, the scalar wavefunction of a tachyon is obtained which satisfies the Klein-Gordon equation. Expressions for transmission and reflection coefficients of a scalar tachyon wave from a Schwarzschild surface are obtained. It is found that transmission and reflection coefficients are equal. Expressions for energy and momentum of a tachyon, emitted from a Schwarzschild black hole, are also obtained. (7 refs.)

64804 Eigenvalues of the Chandrasekhar-Page angular functions. K.G.Suffern (School of Math. & Phys., Macquarie Univ., North Ryde, Australia).
J. Math. Phys. (USA), vol.24, no.5, p.1350-8 (May 1983).
The Chandrasekhar-Page angular functions for the Dirac equation in the Kerr-Newman background are expanded as series of hypergeometric polynomials, and a three-term recurrence relation is derived for the coefficients in these series. This leads to a transcendental equation for the determination of the separation consant which is obtained initially as a power series and is then iterated by the method of Blanch (1946) and Bouwkamp (1947). (14 refs.)

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1167-72 (Nov. 1982). [received: April 1983]
Discusses the interior solution of the Einstein-Maxwell equations for stable static sphere of charged perfect fluid. (7 refs.)

64806 Is there a quantum equivalence principle?. P.Candelas (Centre for Theoretical Phys., Univ. of Texas, Austin, TX, USA), D.W.Sciama.
Phys. Rev. D (USA), vol.27, no.8, p.1715-21 (15 April 1983).
The understanding that has been gained of accelerated vacua sheds new light on the classic issue of the self-force suffered by a uniformly accelerated charge. Moreover, the fact that, as a result of quantum theory, the radiative decay of an excited atom can be viewed equivalently as the result of the vacuum fluctuations of the electromagnetic field or as the result of the radiative self-force of the electron is shown to be nontrivially linked with the equivalence principle. 04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

64807 The complete field of charged perfect fluid spheres and of other static spherically symmetric charged distributions. P.S.Florides (Trinity Coll., Univ. of Dublin, Dublin, Ireland).
J. Phys. A (GB), vol.16, no.7, p.1419-33 (11 May 1983).
Exact solutions are presented which describe the complete field (in the interior and exterior) of the following static spherically symmetric systems: (I) charged perfect fluid spheres and (II) charged distributions with no radial stress. Perfect fluidity in systems (I) and radial stress in systems (II) are defined in two distinct ways and exact solutions are obtained in each case. All the solutions are well behaved everywhere and satisfy the necessary boundary conditions across the surface of the distribution as well as the elementary flatness conditions at the centre of the distribution. Outside the distribution, the solutions are identical to the (exterior) Nordstrom solution. Inside the distribution the solutions for systems (I) reduce to the interior Schwarzschild solution on setting the charge density equal to zero. The solutions for systems (II) reduce, on setting the charge density to zero, to the 'new interior Schwarzschild solution' obtained by the author (1974). It is suggested that the solutions for systems (II) may represent the field inside a charged Einstein cluster. (7 refs.)

64808 Newtonian gravity on the null cone. J.Winicour (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1193-8 (May 1983).
For a general relativistic ideal fluid, the author analyzes the Newtonian limit of the initial value problem set on a family of null cones. The underlying Newtonian structure is described using Cartan's elegant space-time version of Newtonian theory and a limiting process rigorously based upon the velocity of light approaching infinity. The author finds that the existence of a Newtonian limit imposes a strikingly simple relationship between the gravitational null data (i.e. the shear of the null cones) and the Newtonian gravitational potential. This result has immediate application to numerical evolution programs for calculating gravitational radiation and might serve as the basis for a post-Newtonian approximation scheme. (28 refs.)

64809 A non-Machian solution in Brans-Dicke theory. S.K.Chakraborty (Phys. Dept., Presidency Coll., Calcutta, India).
J. Math. Phys. (USA), vol.24, no.5, p.1359-60 (May 1983).
A solution of the vacuum field equations of the Brans-Dicke theory of gravitation admitting a particular group of motions is found out. The solution is of interest because it is supposed to be at variance with Machian ideas of inertia. (4 refs.)

04.60 QUANTUM THEORY OF GRAVITATION

64810 Vector mesons in Friedman space-time. A.A.Grib, A.V.Nesteruk (Dept. of Theoretical Phys., Leningrad Inst. of Precise Mech. & Optics, Leningrad, USSR).
Gen. Relativ. & Gravitation (USA), vol.15, no.1, p.31-45 (Jan. 1983).
Particle creation of vector mesons in a nonstationary Friedman space-time is investigated by the method of diagonalizing the instantaneous Hamiltonian. The density of particles and the full stress-energy tensor are calculated. Reasons are given for the Higgs treatment of vector mesons in a gravitational field creating pairs of particles. (17 refs.)

64811 Geometrical interpretation of a generalized theory of gravitation. G.Kunstatter, J.W.Moffat (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada), J.Malzan.
J. Math. Phys. (USA), vol.24, no.4, p.886-9 (April 1983).
The geometrical structure is developed for a theory of gravitation, based on a nonsymmetric metric in a four-dimensional real manifold. The local fiber

bundle gauge group is GL(4,*R*), which contains the (local) homogeneous Lorentz gauge group SO(3,1) of general relativity. (8 refs.)

64812 The gauge treatment of gravity. D.Ivanenko, G.Sardanashvily (Dept. of Phys., State Univ. of Moscow, Moscow, USSR).
Phys. Rep. (Netherlands), vol.94, no.1, p.1-45 (Jan. 1983).
The gauge gravitation theory, in spite of twenty five years of its history, still remains the single gap in the excellent gauge picture of fundamental interactions. The main disputable point is the gauge status of Einstein's gravitational field, which is a metric or tetrad field, while gauge fields represent connections on fiber bundles. The corner-stones of Einstein's gravitation theory are the relativity and equivalence principles. Having been reformulated in the fiber bundle terms, the gravitation theory turns out to be built from these principles directly as a gauge theory of space-time symmetries, which, however, are spontaneously broken down to the Lorentz symmetries. Metric gravitational fields appear in such a theory as the consequence of this spontaneous symmetry breaking and have the nature of Goldstone type fields. The Lorentz, GL(4,*R*) and Poincare gauge theories of gravitation are analyzed from these points of view, and some outlooks of the gauge treatment of gravitation, e.g. as the affine-metric theory, are discussed. (118 refs.)

04.65 SUPERGRAVITY

64813 Gauging of d=11 supergravity?. L.Castellani, P.Fre, F.Giani, K.Pilch, P.van Nieuwenhuizen (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Ann. Phys. (USA), vol.146, no.1, p.35-77 (March 1983).
The role of antisymmetric tensor fields in the gauging of groups is released to theorems on cohomology theory, and Cartan integrable systems are discussed. Examples are given. Various possibilities to gauge $d=11$ supergravity by decontracting its underlying group are considered. In particular the simple supergroups *Osp* (1/64) and *SU*(32/1) yield a negative result, but a certain nonsemisimple supergroup containing *Osp*(1/32) is proposed as a viable candidate. The corresponding action would no longer contain the 3-index photon $A_{\mu\nu\rho}$, but instead a second spin $^3/_2$ field η_μ and boson fields B_μ^{a1a2} and $B_\mu^{a1...a5}$. A first order formalism for $d=11$ is presented. It is to be used for an improved form of dimensional reduction. (25 refs.)

64814 Local symmetries in extended conformal gravity and conformal supergravity in superspace. F.Mansouri (Dept. of Phys., Univ. of Cincinnati, Cincinnati, OH, USA).
J. Math. Phys. (USA), vol.24, no.4, p.890-6 (April 1983).
The extended conformal field theory of gravity is discussed, and its local symmetries are compared to those of Einstein and standard Weyl theories. It is then shown that the local symmetries of the extended conformal geometry are also natural for the construction of SU(*N*)-extended conformal supergravity theories in superspace. The natural superspace for the formulation of such theories is one with two sets of four-component fermionic variables which transform oppositely under scale transformations. (14 refs.)

04.80 EXPERIMENTAL TESTS OF GENERAL RELATIVITY AND OBSERVATIONS OF GRAVITATIONAL RADIATION

64815 Gravitational anisotropies of gyromagnetic ratios and tests of general relativity. J.C.Gallop, B.W.Petley (NPL, London, England).
Nature (GB), vol.303, no.5912, p.53-4 (5 May 1983).
It is a direct consequence of the Einstein equivalence principle (EEP) that all atomic clocks will run at the same rate if situated at the same point in space-time. This prediction of a universal gravitational redshift is a property of any self-consistent metric theory of gravity. The class of experiments considered essentially involves a comparison of two clocks, one of which is a quartz crystal stabilized to a caesium-beam atomic frequency standard, and the other, more important for this discussion, is a NMR clock, for which the 'ticks' are provided by the free precession of a sample of polarized nuclear spins in a stable and uniform magnetic field. Two experimental null results have been reported, one by Hughes (1960) and the other by Drever (1961). The authors point out that some measurements already exist for spin 1/2 systems which can put tighter limits on anisotropic precession frequencies than the Hughes-Drever results, and suggest an experimental technique that should allow a further improvement in precision by up to six orders of magnitude. (22 refs.)

64816 Test of the principle of equivalence by a null gravitational red-shift experiment. J.P.Turneaure (Dept. of Phys., Stanford Univ., Stanford, CA, USA), C.M.Will, B.F.Farrell, E.M.Mattison, R.F.C.Vessot.
Phys. Rev. D (USA), vol.27, no.8, p.1705-14 (15 April 1983).
A test of the Einstein equivalence principle (EEP) was performed by carrying out a 'null' gravitational red-shift experiment. The experiment compared the rates of a pair of hydrogen maser clocks with those of a set of three superconducting-cavity stabilised oscillator clocks as a function of the solar gravitational potential. If EEP were not valid, the relative rates could vary with potential. During the experiment, the solar potential in the laboratory varied approximately linearly at 3 parts in 10^{12} per day because of the Earth's orbital motion, and diurnally with an amplitude of 3 parts in 10^{13} because of the Earth's rotation. An upper limit on the relative frequency variation of 1.7 parts in 10^2 of the external potential was set. The accuracy was limited by the frequency stability of the clocks and by unmodelled environmental effects. The result is consistent with the EEP at the two percent level. The experiment can also be viewed as setting a limit on a possible spatial variation of the fine-structure constant. (17 refs.)

64817 Upper bounds for density matrices using path integrals. E.P.Gross (Dept. of Phys., Brandeis Univ., Waltham, MA, USA).
J. Stat. Phys. (USA), vol.30, no.1, p.45-66 (Jan. 1983).
Discusses upper bounds for density matrices for a particle, that occur in potential theory, and as a result of averaging over other degrees of freedom. The Weiner path integral representation is used. A basic technique of Symanzik (1965) is generalized in a variety of ways to a series of sharper upper bounds. There are distinct ways of applying the technique to the two-parameter integrals that describe averaged density matrices. A single-parameter application of the Symanzik technique leads to a temperature-dependent potential problem. The nature of the bounds is illustrated for two-parameter integrals by studying a soluble quadratic action, a one-dimensional delta correlation function action and shell correlation functions. The dependence on dimension is studied in the latter case. (12 refs.)

64818 Convergence to stationary states for infinite harmonic systems. C.Boldrighini, A.Pellegrinotti (Inst. Matematico, Univ. di Camerino, Camerino, Italy), L.Triolo.
J. Stat. Phys. (USA), vol.30, no.1, p.123-55 (Jan. 1983).
The authors study the evolution of the states for one-dimensional infinite harmonic systems, interacting through a translation invariant force of rapid decrease. They prove that for a large class of initial states convergence to a Gaussian limiting state, as time goes to infinity, is equivalent to convergence of the covariance. The main assumption on the initial states is a kind of weak dependence between distant regions (mixing condition). They prove also convergence of the covariance under some general assumptions. They show furthermore that there are two countable families of intensive constants of the motion, which are 'inherited' from the corresponding finite systems. The translation invariant limiting states are in one-to-one correspondence with the admissible values of these constants of the motion. Moreover, under some additional regularity assumption, such states are shown to be Gibbs states obtained by a 'Boltzmann-Gibbs' prescription. (19 refs.)

05.30 QUANTUM STATISTICAL MECHANICS

(see also 67. Quantum fluids, and 71. Electron states in condensed matter)

64819 Quantum virial coefficients as cumulants of imaginary time-ordered Mayer diagrams. A.Royer (Centre de Recherche de Math. Appl., Univ. de Montreal, Montreal, Quebec, Canada).
J. Math. Phys. (USA), vol.24, no.4, p.897-912 (April 1983).
The virial coefficients for a quantum gas (including quantum statistics) are expressed as sums of cumulants of connected (generalized) Mayer diagrams, the cumulants being built on the irreducible blocks of the diagrams. The Mayer diagrams are defined for the quantum case in terms of imaginary time-ordered exponentials, the quantum statistics being incorporated in the guise of multiparticle interactions. In order to extend Mayer diagrams to multiparticle interactions the author utilizes terminology and methods from the theory of hypergraphs. The virial coefficients naturally separate into a quantum Boltzmann gas contribution, an ideal quantum gas contribution, and a final term expressing correlations between dynamics and statistics. In the classical limit, connected Mayer diagrams factorize into their irreducible blocks; the cumulants over irreducible blocks then vanish (by a basic property of cumulants), except for diagrams which are themselves irreducible, whence the classical result of Mayer (extended to multiparticle interactions). In the quantum case, the imaginary time ordering prevents the factorization into irreducible blocks by time entangling them. As a further illustration of the use of hypergraph-cumulant methods, the author directly deduces the expressions of the virial coefficients in terms of Ursell-Kahn-Uhlenbeck cluster functions (the ideal quantum gas contribution naturally appears in that form). (31 refs.)

64820 Formal state determination. I.D.Ivanovic (Dept. of Phys. & Meteorology, Faculty of Sciences, Belgrade, Yugoslavia).
J. Math. Phys. (USA), vol.24, no.5, p.1199-205 (May 1983).
Following the general results of Park and Band (1971) it is shown that any state of a quantal ensemble allowed by the Hilbert space formulation of nonrelativistic quantum mechanics may be determined from the results of measurements, under the assumption that all measurements, those of energy, position, and spin projection, are in accordance with the projection postulate. (18 refs.)

64821 Particle statistics in three dimensions. R.Sorkin (Inst. for Advanced Study, Princeton, NJ, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1787-97 (15 April 1983).
A generalised framework for particle statistics is developed within which it becomes clear how bosons can combine to form fermions without violating the normal connection between spin and statistics. In the situation where internal and external particle degrees of freedom are separable, the possible statistical types are found and their combining rules derived. Here the statistical 'interaction' between two particles is characterised either by the familiar sign or by an integer ('twist number'). However, further possibilities arise if the separability of external from internal degrees of freedom fails, as it can in gauge theories. In spatial dimensions other than three the 'fermion from boson' phenomenon does not occur. (16 refs.)

64822 Reexamination of the third-order renormalisation-group calculation for a one-dimensional interacting Fermi system. Chin-sen Ting, Xian-xi Dai, Bambi Hu (Dept. of Phys., Univ. of Houston, Houston, TX, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4384-93 (1 April 1983).
A one-dimensional interacting Fermi system with weak-coupling parameters g_1 (<0) and g_2 is reexamined in the third-order renormalisation-group approach. The authors' result indicates that the value of the invariant coupling g'_1 varies, depending on whether the limit $\omega \rightarrow 0$, $q=0$ or $\omega=0$, $q \rightarrow 0$ is

taken. For $\omega \rightarrow 0$, $q=0$, the invariant coupling g'_1 scales to $g'_1/\pi v \simeq -1.24$, and for $\omega=0$, $q \rightarrow 0$, it scales to $g'_1/\pi v \simeq -0.716$. They also argue that the invariant coupling g'_1 obtained from neither limit is appropriate for calculating the critical exponents of various response functions. (23 refs.)

05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

64823 **Subharmonic stroboscopic sampling method for study of period-doubling bifurcation and chaotic phenomena in forced nonlinear oscillators.** Hao Bai-Lin (Inst. of Theoretical Phys., Acad. Sinica, Peking, China), Zhang Shu-Yu.
Acta Phys. Sin. (China), vol.32, no.2, p.198-208 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
By using subharmonic stroboscopic sampling method, very high resolution, comparable with that for discrete mappings, has been reached in numerical study of periodically forced nonlinear oscillators. For the first time period-doubling bifurcation sequences up to 8192th subharmonics and corresponding sequences of chaotic bands are identified for a system, described by ordinary differential equations. Secondary and tertiary bifurcation sequences embedded in chaotic bands are shown to exist. Merits and limitations of this method as well as some precaution in using it are discussed briefly. (26 refs.)

64824 **A local time approach to the self-intersections of Brownian paths in space.** J.Rosen (Dept. of Math. & Statistics, Univ. of Massachusetts, Amherst, MA, USA).
Commun. Math. Phys. (Germany), vol.88, no.3, p.327-38 (March 1983).
The author studies the Brownian functional $\alpha(x,B)=\int_B\int\delta_x(W_t\text{-}W_s)dsdt$, where W_t is a Brownian path in two or three dimensions. For B off the diagonal, $\alpha(x,B)$ is identified with a local time, and the Holder continuity of $\alpha l(x,B)$ in both x and B is established. (20 refs.)

64825 **Brownian motion, the second law and Boltzmann.** T.W.Marshall.
Eur. J. Phys. (GB), vol.3, no.4, p.215-22 (1982).
The relative merits of 'Boltzmann entropy' and 'Gibbs entropy' are discussed. It is found that, for describing the irreversible features of Brownian motion the 'Gibbs entropy' is the superior concept. In terms of this the Brownian motion gives an excellent illustration of the second law of thermodynamics. The historical origins of the 'Gibbs entropy' are examined, and it is concluded that Ludwig Boltzmann must be given a substantial part of the credit for it. On the other hand, the equation $S=k \log W$, which has been attributed posthumously to Boltzmann, does less than full justice to his concept of entropy, and has led to serious misunderstandings in the theory of Brownian motion. (29 refs.)

64826 **Jumping particle model. Period doubling cascade in an experimental system.** P.Pieranski (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
J. Phys. (France), vol.44, no.5, p.573-8 (May 1983).
An experimental model of a modification of the Fermi acceleration problem is described. Evidence is presented for three consecutive bifurcations on the period doubling route of the system from regular to chaotic behaviour. (14 refs.)

64827 **Large coupling behaviour of the Lyapunov exponent for tight binding one-dimensional random systems.** J.Avron, W.Craig, B.Simon (Div. of Phys., Math. & Astron., California Inst. of Technol., Pasadena, CA, USA).
J. Phys. A (GB), vol.16, no.7, p.L209-11 (11 May 1983).
Studies the Lyapunov exponent $\gamma_\lambda(E)$ of $(hu)(n)=u(n+1)+u(n-1)+\lambda V(n)u(n)$ in the limit as $\lambda \rightarrow \infty$ where V is a suitable random potential. The authors prove that $\gamma_\lambda(E) \sim \ln\lambda$ as $\lambda \rightarrow \infty$ uniformly as E/λ runs through compact sets. They also describe a formal expansion (to order λ^{-2}) for random and almost periodic potentials. (9 refs.)

64828 **Self-diffusion for particles with stochastic collisions in one dimension.** C.Kipnis (Courant Inst. for Math. Sci., New York, NY, USA), J.L.Lebowtiz, E.Presutti, H.Spohn.
J. Stat. Phys. (USA), vol.30, no.1, p.107-21 (Jan. 1983).
Color diffusion in a classical fluid composed of two species differing only by color is intimately connected with the asymptotic behavior of trajectories of test particles in the equilibrium system. The authors investigate here such behaviour in a one-dimensional system of 'hard' points with density ρ and velocities ± 1. Colliding particles reflect each other with probability p and pass through each other with probability $1-p$. They show that for $p>0$ the appropriately scaled trajectories of n particles converge to $\rho^{-1}b(t)+(1-p)(\rho p)^{-1}b_j(t)$, $j=1, \ldots, n$. The $b(t)$, $b_j(t)$ are standard, independent Brownian motions. The common presence of $b(t)$ means that motions are not independent and hence that the macroscopic state of the colored system is not in local equilibrium with respect to color. (11 refs.)

64829 **The escape time in nonpotential systems.** C.W.Gardiner (Phys. Dept., Univ. of Waikato, Hamilton, New Zealand).
J. Stat. Phys. (USA), vol.30, no.1, p.157-77 (Jan. 1983).
A generalisation of Kramer's method (1940) is developed for computing the escape time in nonpotential systems. The method is applied to i) moderate friction case in the Kramers problem; ii) a certain two dimensional system treated by Caroli et al. (1982) using a perturbative method. (18 refs.)

64830 **On the dynamics of excitations in disordered systems.** S.Mukamel (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA).
J. Stat. Phys. (USA), vol.30, no.1, p.179-84 (Jan. 1983).
A new, time-local (TL) reduced equation of motion for the probability distribution of excitations in a disordered system is developed. To $O(k^2)$ the TL equation results in a Gaussian spatial probability distribution, i.e. $\langle P(\mathbf{r},t)\rangle=[(2\pi\xi)^{1/2}]^{-d}\exp(-r^2/2\xi^2)$, where $\xi=\xi(t)$ is a correlation length, and $r=|\mathbf{r}|$. The corresponding distribution derived from the Hahn-Zwanzig (HZ) equation is more complicated and assumes the asympotic ($r \rightarrow \infty$) form: $\langle P(\mathbf{r},s)\rangle \sim (s\xi^d)^{-1}\exp(-r/\xi).(r/\xi)^{(1-d)/2}$ where $\xi=\xi(s)$, d is the space dimensionality, and s is the Laplace transform variable conjugate to t. The HZ distribution generalizes the scaling form suggested by Alexander et al. (1981) for $d=1$. In the Markov limit $\xi(t) \sim \sqrt{t}$, $\xi(s) \sim 1/\sqrt{s}$, and the two distributions are identical (ordinary diffusion). (11 refs.)

64831 **Preliminaries to the ergodic theory of infinite-dimensional systems: a model of radiant cavity.** G.Casati (Istituto di Fisica, Univ. di Milano, Milano, Italy), I.Guarneri, F.Valz-Gris.
J. Stat. Phys. (USA), vol.30, no.1, p.195-217 (Jan. 1983).
The authors discuss a number of mathematical results that are relevant to the statistical mechanics of a model of radiant cavity in which the electromagnetic field interacts with a nonlinear charged oscillator. In particular, they show that energy equipartition in the sense of Jeans (1916) would exclude local exponential instability of orbits; it would also prevent the existence of significant finite invariant measures on a given energy surface. A phase space of infinite total energy is defined, and an invariant measure in it is built, for which different modes of the field are statistically independent. (13 refs.)

64832 **Markov processes as a tool in field theory.** E.B.Dynkin (Dept. of Math., Cornell Univ., Ithaca, NY, USA).
J. Funct. Anal. (USA), vol.50, no.2, p.167-87 (1 Feb. 1983).
Brydges, Frohlich, and Spencer (Commun. Math. Phys., vol.83, p.123-50, 1982) have successfully applied Markov chains to classical spin systems. Using probabilistic methods in a more systematic way, this paper improves some of their results. The methods can be extended to fields with continuous parameter such as $P(\phi)$ fields. (7 refs.)

64833 **Equilibrium potential of killed Markov process.** Li Zhichan (Hebei Univ., Baoding, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.12, p.1255-8 (Dec. 1982).
The equilibrium problem of the Green potentials for Brownian motion has attracted general attention. The author investigates the equilibrium potential of the killed Markov process, following the work by Blumenthal and Getoor (1968) on its equilibrium measure. (5 refs.)

64834 **Fokker-Planck description of multi-degree-of-freedom systems with correlated fluctuations.** B.J.West (Center for Studies of Nonlinear Dynamics, La Jolla Inst., La Jolla, CA, USA), K.Lindenberg.
Phys. Lett. A (Netherlands), vol.95A, no.1, p.44-6 (11 April 1983).
A Fokker-Planck equation is derived for a many-degree-of-freedom nonlinear Langevin equation driven by parametric gaussian fluctuations with finite correlation times. An oscillator with a fluctuating frequency is presented as an example. (22 refs.)

64835 **Random walk in a random environment and $1/f$ noise.** E.Marinari (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France), G.Parisi, D.Ruelle, P.Windey.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1223-5 (25 April 1983).
A simple model showing a $1/f$ behavior is proposed. It is argued, on the basis of a scaling argument, that is has $(1nf)^k$ corrections. Numerical simulations confirm this picture. (5 refs.)

64836 **Comment on 'hopping mechanism generating $1/f$ noise in nonlinear systems'.** M.R.Beasley (Dept. of Appl. Phys., Stanford Univ., Stanford, CA, USA), D.D'Humieres, B.A.Huberman, R.F.Vos, F.T.Arecchi, F.Lisi.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1328-30 (25 April 1983).
In a letter Arecchi and Lisi (1982) claim to have observed $1/f$ noise associated with the chaotic dynamics of a certain driven nonlinear system. In the comment it is pointed out that the essential features of the noise spectra observed by those authors, which are also observed in the case of the forced pendulum, can be understood in terms of a simple model that is in good qualitative agreement with their results but which does not support their contention that such chaotic systems exhibit an intrinsic $1/f$ noise. (11 refs.)

64837 **The approach to the Boltzmann distribution in Brownian motion.** T.W.Marshall (Dept. of Math., Manchester Univ., Manchester, England).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.241-5 (March 1983).
The solution is obtained, in the weak-damping approximation to the problem of the approach to the barometric distribution in Brownian motion. (5 refs.)

05.50 LATTICE THEORY AND STATISTICS; ISING PROBLEMS

(see also 75.10H Ising models)

64838 **Higher-order calculations in the real space dynamic renormalization group: one dimension.** J.Luscombe, G.F.Mazenko (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
Ann. Phys. (USA), vol.146, no.1, p.174-208 (March 1983).
The application of real space dynamic renormalization group methods to the one-dimensional kinetic Ising model is extended to one order higher in perturbation theory. It is shown that the treatment of short-range, local quantities is improved in going to higher order in the perturbation expansion, while that of the long-range properties remains largely unaffected. Arbitrariness in the real space mapping function and how it may be exploited to our advantage is discussed. It is shown that the renormalized Hamiltonian continues to be characterized by one coupling through second order. The authors find that the single spin-flip kinetic Ising model generates at second-order new spin-flip mechanisms in the renormalized dynamical operator but that their effects are small (at most 2%) over the entire temperature range. (24 refs.)

64839 **Note on the 'susceptibility' exponent for two-dimensional percolation.** V.Privman (Baker Lab., Cornell Univ., Ithaca, NY, USA), I.D.Vagner.
Z. Phys. B (Germany), vol.50, no.4, p.353-5 (1983).
New percolation series derived by Duarte and Ruskin (see ibid., vol.46, p.225, 1982) are analysed with a recently developed method of series analysis which explicitly accounts for the leading nonanalytic confluent term. The authors' study provides additional support to the conclusion that systematic deviations

of γ values from the conjectured $\gamma=43/18$ are removed. Estimates of the exponent Δ_1 of the leading nonanalytic confluent term are obtained and compared with previous results. (17 refs.)

64840 Expansions and phase transitions for the ground state of quantum Ising lattice systems. J.R.Kirkwood, L.E.Thomas (Dept. of Math., Univ. of Virginia, Charlottesville, VA, USA).
Commun. Math. Phys. (Germany), vol.88, no.4, p.569-80 (1983).
Expansions for the ground state of some transverse Ising-like models are developed. These expansions are easily estimated by the solutions to some simple implicit equations. Short range or long range order obtains, depending on the coupling constants of the models. (9 refs.)

64841 Potts model formulation of branched polymers in a solvent. A.Coniglio (Dept. of Phys., Boston Univ., Boston, MA, USA).
J. Phys. A (GB), vol.16, no.6, p.L187-91 (21 April 1983).
A Potts model formulation of the statistics of branched polymers or lattice animals in a solvent is given. The Migdal-Kadanoff renormalisation group is employed to study the critical behaviour or fractal dimension of the branched polymer. Four different critical behaviours are found, corresponding to random animal, collapse or θ point, percolation and compact cluster. The θ point behaviour is described by a tricritical point while percolation corresponds to a higher-order critical point, where the effect of the solvent on the branched polymer is the same as the screening effect of the other clusters in percolation. (24 refs.)

64842 On the location of the critical point of the *q*-state Potts model on the hypercubic lattice. D.Hajdukovic (Dept. of Phys. & Meteorology, Faculty of Natural & Math. Sci., Belgrade, Yugoslavia).
J. Phys. A (GB), vol.16, no.6, p.L193-8 (21 April 1983).
The critical temperature of the q-state ferromagnetic Potts model on a hypercubic lattice in d dimensions is expressed as an explicit function of both d and q. The author's formula agrees very well with the existing accurate results and numerous numerical studies for particular values of d and q, and it seems to be an excellent approximation for all d and q. (17 refs.)

64843 On random walks in percolation models. T.Vicsek (Res. Inst. for Tech. Phys., Budapest, Hungary).
J. Phys. A (GB), vol.16, no.6, p.1215-20 (21 April 1983).
Random walks on percolation clusters of any dimension consisting of both directed and undirected bonds are studied. Results conjectured to be exact and supported by Monte Carlo simulation are deduced for the critical parameters of the problem. It is shown that in the undirected case of the model the probabilities of finding the particle in the sites of a finite cluster have a uniform limit distribution. (23 refs.)

64844 Exact results for 2D directed animals on a strip of finite width. V.Hakim (Lab. de Phys. Theorique et Hautes Energies, Univ. Paris-Sud, Orsay, France), J.P.Nadal.
J. Phys. A (GB), vol.16, no.7, p.L213-18 (11 May 1983).
Proves a conjecture giving the exact number of directed animals of s sites with any root, on a strip of finite width of a square lattice. The authors also rederive more simply some previous results concerning the connective constant and particular eigenvectors of the transfer matrix. (11 refs.)

64845 Random resistor networks as a theory of interacting Bose and Fermi fields. I. Effective medium treatment of percolation. J.P.Carton (Service de Phys. du Solide et de Resonance Magnetique, CENS, Gif-sur-Yvette, France).
J. Phys. A (GB), vol.16, no.7, p.L219-23 (11 May 1983).
The problem of random resistor networks is formulated with the help of functional integrals over commuting and anticommuting variables and leads to interacting Bose and Fermi fields. The effective medium approximation is derived following a variational principle. (7 refs.)

64846 Yang-Lee singularity and the mobility edge. A.Kapitulnik (Dept. of Phys. & Astron., Tel Aviv Univ., Ramat Aviv, Tel Aviv, Israel), Y.Shapir.
J. Phys. A (GB), vol.16, no.7, p.L243-8 (11 May 1983).
Gives an exact mapping of the problem of an electron in a one-dimensional random potential onto a Yang-Lee model with random imaginary fields and random bonds. The resistance and inverse localisation length are given respectively by the partition function and the free energy of the spin model. The allowed states and the singular point of their density at the band edge are mapped onto the zeros of the partition function and the Yang-Lee edge. Similar relations are found on a Bethe lattice near the critical point for the pure models. Extending naively to the random case, these relations reproduce the field theory of Harris and Lubensky (1981) with the expansion below eight dimensions. In the presence of randomness, however, the two models differ for any dimension greater than one due to the interactive character of the spin model. This causes its density of states to vanish at the edge in contrast to the $\beta=0$ of the non-interacting electronic model. (34 refs.)

64847 The Oguchi approximation is exact for infinite-dimensional lattices. P.A.Pearce (Dept. of Theoretical Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
J. Phys. A (GB), vol.16, no.7, p.1475-81 (11 May 1983).
Spin systems are considered on sequences of lattices of increasing dimensionality. By dividing the lattices into suitable clusters with fixed internal interactions and scaling the external spin interactions inversely with the lattice dimension d, it is shown that the Oguchi effective field approximation becomes exact in the limit $d\rightarrow\infty$. (10 refs.)

64848 On a relation between percolation and phase transition in the gauge invariant Ising model. R.Marra (Istituto di Fisica, Univ. di Salerno, Salerno, Italy).
J. Math. Phys. (USA), vol.24, no.4, p.913-16 (April 1983).
The author points out a connection between the coexistence of phases in the Z_2 lattice gauge model and the existence of infinite clusters for a suitable associated system of duplicate currents. (11 refs.)

64849 On the relations between irreducible representations of the hyperoctahedral group and O(4) and SO(4). M.Baake, B.Gemunden, R.Oedingen (Phys. Inst., Univ. Bonn, Bonn, Germany).
J. Math. Phys. (USA), vol.24, no.5, p.1021-4 (May 1983).
The authors describe the relations between the irreducible representations of the hyperoctahedral group in four dimensions and irreducible, low-dimensional representations of the orthogonal groups O(4) and SO(4). (4 refs.)

64850 Kinematics of nucleation in a lattice gas model: microscopic theory and simulation compared. O.Penrose, A.Buhagiar (Faculty of Math., Open Univ., Milton Keynes, England).
J. Stat. Phys. (USA), vol.30, no.1, p.219-41 (Jan. 1983).
A method is described for calculating from first principles the coefficients in the Becker-Doring equations (1935) for the rate of change of the distribution of cluster sizes in a low-density lattice gas with Kawasaki dynamics (1966). The method depends on solving a diffusion problem for the concentration of particles near a given cluster. The coefficients are calculated for cluster sizes up to 6, on a simple cubic lattice at a temperature 0.59 times the critical temperatures, and extrapolated to larger sizes. The resulting version of the Becker-Doring equations is then solved numerically. Comparison with the results of a computer simulation (at overall concentration 0.075) carried out by Kalos and others (1978) indicates that the method gives quite good predictions of the dependence of the cluster distribution on the critical cluster size (usually denoted by l^*) but that the predicted rate of change of critical cluster size with time is too small, at this overall concentration, by a factor of about 0.3. (15 refs.)

64851 Study of the Kosterlitz-Thouless transition by the Mayer expansion. K.R.Ito (Dept. of Math., Bedford Coll., Univ. of London, London, England).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.339-403 (4 April 1983).
The Kosterlitz-Thouless transition in the 2D U(1) σ- or XY-models is studied by the Mayer expansion through the duality transformation. If the inverse temperature β is large, the pressure and the two-point function $\langle\cos(\theta_0-\theta_\zeta)\rangle$ are given by $\Sigma_2{}^\infty a_N(\beta)$ and $\exp[(2/\beta)C_0(\zeta)+\Sigma_2{}^\infty b_N(\beta;\zeta)]$ respectively. Here $C_0(\zeta)\simeq-(2\pi)^{-1}\ \log(|\zeta|+1)$, (i) $|a_N(\beta)|\leq C_1(N)\times\exp[-\beta K_1 N]$, (ii) $|b_N(\beta;\zeta)|\leq C_2(N)\ \exp[-\beta K_2 N]|C_0(\zeta)|$, $K_i>0$. Each term is divergent for $\beta<\beta_c$. The series seems to be absolutely convergent for $\beta>\beta'_c$. (16 refs.)

64852 High-temperature expansion of surface critical exponents for the classical *n*-vector model. K.Ohno, Y.Okabe (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.38-40 (11 April 1983).
The surface critical exponents of the classical n-vector model are investigated in the high-temperature series expansion. The first nine coefficients of the layer susceptibility for the semi-infinite simple cubic lattice are presented. The n-dependence of surface exponents is compared with the results of other theories. (12 refs.)

64853 Surface critical exponents in the 1/*n* expansion. K.Ohno, Y.Okabe (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.41-3 (11 April 1983).
The critical behavior of the semi-infinite ϕ^4 model with O(n) symmetry is studied in the scheme of the $1/n$ expansion. The surface critical exponents $\eta\|$, $\eta\perp$ and λ are calculated up to O($1/n$) for arbitrary spatial dimension d in the case of the ordinary transition. (14 refs.)

64854 Excitation transport on substitutionally disordered lattices. R.F.Lorig, H.C.Andersen, M.D.Fayer (Dept. of Chem., Stanford Univ., Stanford, CA, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1324-7 (25 April 1983).
An exact diagrammatic analysis of transport of electronic excitations among chromophores distributed randomly on a lattice is presented. An approximate solution is obtained that allows calculation of transport properties for transfer rates of any range for any lattice type and any concentration. Simple cubic lattice results are presented for Forster transfer and nearest-neighbor transfer. The latter has a percolation threshold that is described in a qualitatively correct fashion by the authors approximation. (13 refs.)

64855 Interface energy in random systems. B.Derrida (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France), J.Vannimenus.
Phys. Rev. B (USA), vol.27, no.7, p.4401-11 (1 April 1983).
The authors study the interface energy σ as a function of disorder in two-dimensional Ising-type systems at $T=0$ for the percolation and frustration models. Their approach consists in calculating this energy for long strips of varying widths by a random sampling method, then extrapolating the results. In the weak-disorder limit, very wide strips may be studied and accurate values are obtained for the first-order correction to the interface energy in both models. Only moderate widths (up to $N=9$-10) can be studied in the general situation and they use finite-size scaling to analyse the data in the region of the threshold, where σ vanishes with a critical exponent υ. For percolation, they obtain $\upsilon/\nu=0.98\pm0.05$, where ν is the correlation-length exponent, in agreement with Deutscher and Rappaport's proposal (1979) that $\upsilon=\nu$ exactly. The analysis of the results is more difficult in the case of frustration, because size effects are important and the scaling region is not reached for $N=9$. The data show that Monte Carlo results for σ are unreliable and that much care is necessary to reach firm conclusions on the frustration threshold χ_c or the exponents ν and υ. (27 refs.)

64856 Monte Carlo study of weighted percolation clusters relevant to the Potts models. M.Sweeny (Dept. of Phys., Univ. of Chicago, Chicago, IL, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4445-55 (1 April 1983).
The two-dimensional Potts models were simulated with the use of a Monte Carlo method. This study is unique in that the weighted percolation clusters first described by Kasteleyn and Fortuin in 1969 are simulated. An auxiliary data structure is described which enables the author to determine the connectedness of large clusters very efficiently. His simulation of the percolation problem was found not only to be affected by a critical slowing down. Critical exponents were found by studying the size and shape of large clusters. The results agree with previous studies done on integer values of q, and with the conjecture of den Nijs. (22 refs.)

64857 Dilatons as one type of soliton. A.I.Mel'ker (Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1809-10 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3186-8 (Oct. 1982). [received: April 1983]
It was previously shown by the method of molecular dynamics that in one-dimensional crystals (anharmonic chains) the elementary carriers of disruption are dilatons, anomalously extended bonds whose deformation exceeds the elastic limit of the interatomic bonds. The authors explain the form of the dilaton trajectories, and make it possible to understood the unstable character of the vibration spectrum of an anharmonic chain of atoms. (9 refs.)

05.60 TRANSPORT PROCESSES: THEORY

64858 **Boundary element solutions to steady convective diffusion equations.** M.Ikeuchi (Dept. of Appl. Math., Okayama Univ. of Sci., Okayama, Japan), K.Onishi.
Appl. Math. Modelling (GB), vol.7, no.2, p.115-18 (April 1983).
The boundary element methods, direct and iterative methods, are presented for approximate solutions of two- and three-dimensional convective diffusion equations in a steady state. The direct method uses a fundamental solution to the diffusion-convection operator, while the iterative method utilizes the fundamental solution to the Laplacian. Constant boundary elements are used for the discretization of boundary integral equations. Simple examples are considered to show stability, convergence and accuracy in numerical solutions. (1 ref.)

64859 **The Dufort-Frankel Chebyshev method for parabolic initial boundary value problems.** D.Gottlieb (Tel-Aviv Univ., Tel-Aviv, Israel), L.Lustman.
Comput. & Fluids (GB), vol.11, no.2, p.107-20 (1983).
A pseudospectral explicit method for solving parabolic problems is presented. A stability theorem is proved for model equations, and numerical experiments discussed. (7 refs.)

64860 **A similarity solution of the linearized Boltzmann equation with application to thermophoresis of a spherical particle.** Y.Sone, K.Aoki (Dept. of Aeronaut. Engng., Kyoto Univ., Kyoto, Japan).
J. Mec. Theor. & Appl. (France), vol.2, no.1, p.3-12 (1983).
As an application of the similarity solution, the thermophoresis of a spherical particle with large thermal conductivity is investigated for the whole range of Knudsen number. The result confirms the negative thermophoresis, which has been pointed out by the authors on the basis of the generalized slip flow theory for a slightly rarefied gas. (20 refs.)

64861 **A simple method for calculating diffusional recombination probabilities.** J.E.Larsen, J.B.Pedersen (Fysisk Inst., Odense Univ., Odense, Denmark).
J. Comput. Phys. (USA), vol.49, no.3, p.458-64 (March 1983).
Presents a numerical method for calculating the diffusion-controlled recombination probability of a pair of interacting particles in an isotropic medium with scavengers. The method is finite and has a controllable accuracy. The algorithm is remarkably simple and can be implemented on a programmable pocket calculator. (7 refs.)

64862 **Approach to field-induced stationary state in a gas of hard rods.** J.Piasecki (Center for Studies in Statistical Mech., Univ. of Texas, Austin, TX, USA).
J. Stat. Phys. (USA), vol.30, no.1, p.185-93 (Jan. 1983).
The Boltzmann equation describing one-dimensional motion of a charged hard rod in a neutral hard rod gas at temperature $T=0$ is solved. Under the action of a constant and uniform field the charged particle attains a stationary state. In the long time limit the velocity autocorrelation function decays via damped oscillations. In the reference system moving with the mean particle velocity the decay of fluctuations in the position space is governed (in the hydrodynamic limit) by the diffusion equation. Both the stationary current and the diffusion coefficient are proportional to the square root of the field. It is conjectured that this result also holds for $T>0$ in a strong field limit. (4 refs.)

64863 **Transport of light radiation in a spatially finite three-dimensional scattering medium.** V.A.Savel'ev, S.B.Mogil'nitskii (S.M. Kirov Polytech. Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.752-6 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.82-5 (Aug. 1982). [received: April 1983]
The authors propose a new method for solving radiation transport problems, which includes the analytic form for the case of normal incidence and the effect of spatial finiteness of the scattering medium. The formation of the light field accompanying changes in the optical parameters and optical dimensions of the medium is analyzed. They examine the simplest case of a geometry of a scattering medium in the form of a parallelipiped with optical length τ_x, height τ_y, and width τ_z. The analysis is performed for the case $\lambda=1$, $\tau_y=\tau_z$ with the latter varying in the range 0.1 to ∞. The results obtained show that the light field depends strongly on the optical dimensions of the medium. The limiting values of the optical dimensions ($\tau_y=\tau_z$), beginning with which the spatial finiteness of the medium can be neglected, are determined. (11 refs.)

05.70 THERMODYNAMICS

(see also 44.60 Thermodynamic processes, 64. Equations of state, phase equilibria and phase transitions, 65. Thermal properties of condensed matter; for chemical thermodynamics, see 82.60)

64864 **Development of structures in the states far from equilibrium at external regulation.** J.Krempasky (Inst. of Phys., Slovak Acad. of Sci., Bratislava, Czechoslovakia), R.Kveton.
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.2, p.115-28 (1983).
Deals with the formation of new qualities in inorganic, biological and social systems that can be reduced to unbalanced thermodynamic systems. Thus, the possibility to apply laws describing the evolution of unbalanced inorganic systems is given. The subjective factor, corresponding with external regulation is represented through the member expressing changes in systems not resulting from internal dynamics. It has been demonstrated that the presence of this external regulation can either suppress the number of possible new qualities originating under conditions far from equilibrium, or, on the other hand, increase their number and induce the formation of such structures not resulting from laws describing the internal dynamics of systems. In connection with the fact the problem of achieving optimal system management with respect to minimal system entropy is involved. (16 refs.)

64865 **Solution of a one-dimensional phase change problem with non-uniform initial temperature.** R.S.Gupta, D.Kumar (Dept. of Math., Univ. of Roorkee, Roorkee, India).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.2, p.139-50 (April 1983).
The variable time step methods, proposed earlier by the authors with regard to phase change problems, are applied with some improvements to a problem having a non-uniform initial temperature distribution. A comparison between the numerical results from the present methods and those due to authors, who solve the problem with different techniques, shows a very good agreement. Approximate analytical expressions are also obtained for the temperature distribution as well as for the movement of the interface using the integral method. The computed values from these expressions are found to be very close to those obtained from the numerical methods. (17 refs.)

64866 **The generalized Carnot cycle: a working fluid operating in finite time between finite heat sources and sinks.** M.J.Ondrechen (Dept. of Chem., Northeastern Univ., Boston, MA, USA), M.H.Rubin, Y.B.Band.
J. Chem. Phys. (USA), vol.78, no.7, p.4721-7 (1 April 1983).
The production of work in finite time from a reservoir with finite heat capacity is studied. A model system, for which the only irreversibilities result from finite rates of heat conduction, is adopted. The maximum work obtainable in finite time from such a system is derived, and is found to be strongly dependent upon the reservoir heat capacity. The cycle producing the maximum work is derived for an arbitrary one-component working fluid; no equation of state is assumed. In the optimum cycle, when the working substance is in contact with a finite reservoir, then the temperature of the working fluid is an exponential function of time and the entropy of the working substance is a linear function of time. While the maximum work obtainable in a single fixed-time cycle is a strictly increasing function of the reservoir heat capacity, the efficiency (work produced/heat put in) is a strictly decreasing function of the reservoir heat capacity, for the model system with a finite hot reservoir and an infinite cold reservoir. In the limit where the reservoir heat capacity approaches infinity, the finite-time efficiency approaches the Curzon-Ahlborn efficiency $\eta=1-({T_{\rm low}}^0/{T_{\rm high}}^0)^{1/2}$ for the cycle which produces maximum power. (29 refs.)

64867 **On thermodynamics of non-equilibrium processes.** J.Kratochvil (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia), M.Silhavy.
J. Non-Equilibrium Thermodyn. (Germany), vol.7, no.6, p.339-54 (1982).
A statement of the second law of thermodynamics formulated in the spirit of the classics of the 19th century is shown to yield the existence of the nonequilibrium absolute temperature and nonequilibrium entropy which satisfy the Clausius-Planck dissipation inequality for general processes. A nontraditional form of the first law of thermodynamics employed here is expressed in terms of inequalities analogous to those of the second law. Deep similarities as well as differences between the two laws are thereby revealed. (28 refs.)

64868 **Gibbs' principle and thermodynamic inequalities for nonlinear-elastic bodies.** M.A.Grinfel'd.
Mech. Solids (USA), vol.17, no.3, p.62-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.72-9 (1982).
Proposes a new procedure for obtaining thermodynamic inequalities from Gibbs' principle, that makes it possible to consider solid elastic media in addition to liquid ones. The concept of Gibbs stability of a medium is formulated; in the case of a liquid, this reduces to satisfaction of the classical thermodynamic inequalities. It is shown that the acoustic tensor of a stable nonlinear-elastic material has three nonnegative eigenvalues for any direction of propagation of adiabatic acceleration waves. Thermodynamic inequalities are obtained that characterize a stable isotropic nonlinear-elastic medium in any undistorted configuration. (10 refs.)

64869 **Generalized thermodynamic stability of systems under shear.** C.Perez-Garcia, D.Jou (Dept. de Termologia, Univ. Autonoma de Barcelona, Barcelona, Spain).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.23-6 (11 April 1983).
Starting from the extended irreversible thermodynamics (EIT) theory, some corrections to the specific heat and to the thermal compressibility of a nonequilibrium system are obtained. The authors study the subsequent modifications of the static stability conditions of a system under shear. In some situations, a shear-induced melting transition can be present. (13 refs.)

64870 **Percolation cluster numbers and effective surface tension.** H.Franke, J.Kertesz (Inst. fur Theoretische Phys., Univ. Koln, Cologne, Germany).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.52-6 (11 April 1983).
The authors analyse Monte Carlo calculated cluster numbers n_s for site percolation up to size $s\approx 200$. For the square lattice at concentration $p=0.65$ and the simple cubic lattice at $p=0.35$ they find the asymptotic behaviour $n_s \propto s^{-5/4}\exp(-0.44s^{1/2})$ and $n_s \propto s^{1/9}\exp(-0.09s^{2/3}+0.8s^{1/3}-13.1s^{-1/3})$, respectively. Applying the surface concept they compute an effective surface tension on the basis of these results. Because of the large negative $s^{-1/3}$ term, however, the concept does not work for small clusters in three dimensions. (12 refs.)

64871 Finite-size analysis of first-order phase transitions: Discrete and continuous symmetries. J.L.Cardy (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA), P.Nightingale.
Phys. Rev. B (USA), vol.27, no.7, p.4256-60 (1 April 1983).
First-order phase transitions are characterised by δ-function singularities in thermodynamic quantities. The way in which these singularities develop in taking the thermodynamic limit is qualitatively different for finite systems and systems infinite in one direction only. The corresponding crossover behaviour, which the authors predict in detail with a renormalisation-group analysis, is a unique feature of first-order transitions and is suggested to be of considerable utility. Both systems with discrete and continuous symmetries are discussed. For the latter they verify their results for the two geometries within the spin-wave approximation. (15 refs.)

64872 Nonlinear scaling fields and corrections to scaling near criticality. A.Aharony (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel), M.E.Fisher.
Phys. Rev. B (USA), vol.27, no.7, p.4394-400 (1 April 1983).
Thermodynamic functions in the vicinity of an ordinary critical point are expected to obey asymptotic scaling laws as $t=(T-T_c)/T_c$ and the ordering field, h, approach zero. However, the optimal scaling variables are the nonlinear scaling fields, $g_t=t+b_th^2+c_tt^2+\ldots$ and $g_h=h(1+c_ht+\ldots)$. The nonlinearities yield correction factors to the leading power-law (and scaling) variation of thermodynamic quantities, L, of the form $(1+a_Lt+b_Lt^2+\ldots)$, etc. where the correction amplitudes $a_L, b_L, \ldots$, are uniquely determined by the nonlinear scaling-field coefficients. It follows that 'analytic' corrections to, e.g. the susceptibility, are directly related to those for the free energy and magnetisation (in zero field). The term b_th^2 also generates nonanalytic contributions such as an additive, energylike term, varying as $|t|^{1-\alpha}$ in the zero-field susceptibility, and factors like $(1+c_L|h|^{2-1/\Delta})$ on the critical isotherm, $t=0$. Irrelevant scaling fields yield further, in general distinct, nonanalytic corrections, and cause shifts in T_c and various amplitudes although 'universal' ratios remain constant. (22 refs.)

64873 The Einstein and Hopf work revisited. J.L.Jimenez, G.del Valle (Facultad de Ciencias, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.259-66 (Feb. 1983).
Einstein and Hopf's work is discussed and, taking into account the radiated energy by the dipole during the fluctuations and the zero point field, the authors deduce Planck's radiation law. (7 refs.)

64874 Configurational entropy of mixtures of molecules having different shapes. E.P.Sokolova.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.115-17 (Feb. 1983). In Russian.
Thermodynamic properties of monomer-parallelepiped systems based on the lattice model are calculated. Parallelepipeds with different length-to-width ratios are considered. Activity coefficients in mixtures of hard cubes are shown to be in good agreement with those of hard spheres. (11 refs.)

06.20F Units

64875 Progress in the realization of the units of capacitance, resistance, and inductance at the National Physical Laboratory, India. S.L.Dahake, R.N.Dhar, A.K.Saxena, V.K.Batra, K.Chandra (Nat. Phys. Lab., New Delhi, India).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.5-8 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Describes the progress made at the National Physical Laboratory (NPL), New Delhi, India, in the realization of the units of capacitance and resistance based on a calculable cross-capacitor. The realization of the unit of inductance in terms of capacitance using the Maxwell-Wein bridge and resonance techniques has also been described. (7 refs.)

06.20H Measurement standards and calibration

64876 Selecting Zener diodes for maximum stability [calibration standard].
Electron. Prod. Des. (GB), vol.4, no.3, p.59-60 (March 1983).
Describes the Datron 4000 Autocal Standard calibrator. The specification includes full IEEE-488 programmability of its output, including continuous scaling of all ranges. This implied electronic switching of its divider circuitry and, since the full accuracy and stability of less than 5 ppm/year—and noise of less than 1 ppm of range—were to be maintained throughout all of its ranges, the use of Zener diodes for its internal reference. The divider aspect was resolved by the use of a variable duty cycle pulse train which operates an FET switch between the reference voltage and ground and the output is averaged to the required derived voltage by a seven-pole Bessel filter. (no refs.)

06.30C Spatial variables measurement

(inc. measurement of all variables extending in space e.g. diameter, height, thickness, displacement, surface topography, particle size, area of disperse systems)

64878 A new microcomputer-controlled laser dimensional measurement and analysis system. R.C.Quenelle, L.J.Wuerz (Hewlett-Packard & Co., Palo Alto, CA, USA).
Hewlett-Packard J. (USA), vol.34, no.4, p.3-4, 6-13 (April 1983).
Describes a microcomputer-controlled instrument from Hewlett-Packard. The 5528A Laser Measurement System consists of a laser head, a measurement display, and precision optical components. It measures linear position, pitch and yaw, straightness, squareness, flatness, and parallelism. (3 refs.)

64879 Automatic compensation [for laser beam measurement system]. D.A.Gardner (Hewlett-Packard Co., Palo Alto, CA, USA).
Hewlett-Packard J. (USA), vol.34, no.4, p.12 (April 1983).
Describes instruments which, when attached to Hewlett-Packard's HP 5528A Laser Measurement System, compensate for changes in atmospheric conditions and for changes in the sample temperature. The air sensor contains devices to measure air pressure, temperature and humidity, and feeds these results as voltages to the instrument's calibrator control unit. The material temperature sensor also gives a voltage to the calibrator so that results can be normalised to 20°C. (1 ref.)

64880 Apparatus for measuring the thermal expansion of solids between 1.5 and 380K. R.Pott, R.Schefzyk (II. Phys. Inst., Univ. zu Koln, Koln, Germany).
J. Phys. E (GB), vol.16, no.5, p.444-9 (May 1983).
Describes a device for measuring the thermal expansion of solids in the temperature range from 1.5 to 380K, based on a three-terminal capacitor method. The construction of the expansion cell allows a fast mounting of the sample without dismantling of the cell, the sample shape being unimportant. The relative sensitivity is $\Delta l/l=10^{-10}$ for $l=10$ mm. The systematic error is in the order of 10^{-7}. The thermal expansion coefficient can be determined with a sensitivity of 10^{-9} K^{-1} and an accuracy of $\pm 2\%$. (9 refs.)

64881 Real-time longitudinal displacement analysis of rough surfaces by observing fringes within objective laser speckles. C.S.Vikram, K.Vedam (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).
Optik (Germany), vol.64, no.2, p.171-5 (May 1983).
A method of real-time observation of usual interference fringes within objective laser speckles is described. This is achieved by illuminating a small object area for larger speckle size and further magnifying the pattern by a TV camera to finally observe significantly large speckles on the monitor. Experimental results obtained using Michelson type of arrangement are described for the measurement of longitudinal object movement. (19 refs.)

64882 Measurement of long radius of curvature. M.V.R.K.Murty (Centro de Investigaciones en Optica AC, Leon, Mexico), R.P.Shukla.
Opt. Eng. (USA), vol.22, no.2, p.231-5 (March-April 1983).
Reviews several methods for the measurement of very long radius of curvature of a convex or concave spherical mirror. These methods have relevance in the measurement of the radii of curvature of laser mirrors. The accuracies achievable with the various methods are compared and summarized. (5 refs.)

64883 Remarks about calibration of automatic analyser of aerosols. A.Drobnik, K.Lukaszewski, K.Pieszynski, Z.Ulanowski (Inst. of Phys., Tech. Univ., of Lodz, Lodz, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.253-6 (1982).
The working principles of the instrument, called an automatic analyser of aerosols (AAA), are presented. Certain problems arising during calibration which are important in interpretation of the measurements are discussed. (2 refs.)

64884 A generalized speckle interferometry method for measuring the arbitrarily oriented (small) displacements of a rigid body. W.Urbanczyk, I.Wilk (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.260-5 (1982).
A simple speckle interferometry method has been presented for measuring the rigid body displacements oriented perpendicularly to both the free propagating laser beam illuminating the object and the reflected beam producing the respective speckling pattern. Also, the lower and upper bound limits of the measuring range were discussed. The principles of a generalized method and the respective setup are considered which allow one to measure the displacements of arbitrary orientations with respect to the light beams used. This method is introduced in two versions: as a free-propagation method, and as a diffuser method. (1 ref.)

64885 Multiplier-type angle-measuring optical systems. P.A.Mikheev.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.483-4 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.13-15 (Aug. 1982). [received: April 1983]
The construction schematics of multiplier-type angle-measuring optical systems are examined. The laws governing the formation of images in systems containing diffraction gratings are derived. The high angular sensitivity of the described systems is demonstrated experimentally. (5 refs.)

64886 Ultrasonic-resonance method of determining transverse dimensions for fine fibers and wires. S.V.Veremeenko, V.G.Meierson (All-Union Sci.-Res. Inst. of Nondestructive Testing, Kishinev, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.579-83 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.3-7 (Aug. 1982). [received: April 1983]
A procedure has been developed for determining the dimensions and radius of inertia for the cross section of fibres and wires by an ultrasonic-resonance method. A description is given of the instrument's block diagram and the design of its acoustic channel. Measuring results for the diameters of fine fibers made of various materials are given. (6 refs.)

64887 Measuring procedure for transverse dimensions of fine rods and wires by the ultrasonic-resonance method. V.G.Meierson.
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.583-9 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.7-13 (Aug. 1982). [received: April 1983]
An analytical procedure is developed for the spectrum of natural-frequency vibrations of a rod having free boundaries, and also experimental criteria for the correspondence between the rod's characteristics and its acoustic model. The procedure can be applied in many measuring problems using the ultrasonic-resonance method, especially for checking the transverse dimensions of fine rods. (6 refs.)

64888 A radioisotope method of thickness measurement for rhodium plating on rings. V.V.Kazantsev, L.S.Voronova (Mendeleev All-Union Metrology Res. Inst., USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.660-2 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.88-91 (Aug. 1982). [received: April 1983]
Measurements have been made of the coating thicknesses on rings from a single batch by radioisotope and gravimetric methods in order to develop an effective method for measuring the thickness of rhodium plating on rings of diameter 20-200 mm that are polished after electroplating. The data indicate that the radioisotope method is preferable as regards providing reliable information on the local and average thicknesses. The error of measurement is ±0.25 μm in the range 2-3 μm and satisfies production requirements. The TPRU-1 radioisotope thickness gauge can be used with GSO 1624-79 standard specimens and an attachment for measuring coating thickness on rings in a routine and acceptance monitoring of coating thickness. 64889 Time and frequency standards based on charged particle trapping. W.M.Itano, D.J.Wineland, H.Hemmati, J.C.Bergquist, J.J.Bollinger (Time & Frequency Div., NBS, Boulder, CO, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1521-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Microwave or optical frequency standards based on internal resonance transitions of ions confined in electromagnetic traps have the fundamental advantages of long observation times and small perturbations. These advantages are somewhat offset by low signal to noise ratios. Work at NBS has concentrated on microwave hyperfine transitions of atomic ions stored in Penning-type ion traps. The use of narrowband, tunable light sources for state selection and detection and for reducing the average kinetic energy of the ions (laser cooling) is an important feature of this work. Results to date include the fluorescence detection and cooling to about 50 mK of a single Mg ion and the observation of a 0.012 Hz linewidth on a 300 MHz $^{25}Mg^{+}$ hyperfine transition. A frequency standard based on ^{201}Hg ions is under development. (21 refs.)

64890 Unleashing a microcomputer in the laboratory. III. K.G.McConnell (Dept. of Engng. Sci. & Mech., Iowa State Univ., Ames, IA, USA), M.Abdelhamid.
Exp. Tech. (USA), vol.7, no.3, p.28-30 (March 1983).
For pt.II see ibid., vol.7, no.2, p.38 (1983). Presents an application of interest to a great number of engineers and researchers: the use of the PET as a data logger. The low price of the PET microcomputer makes it a viable option especially in development systems. The requirements for building a data logger that uses the PET and the use of this system in a specific application are discussed. (5 refs.)

64891 Accuracy of semiautomatic measurements on digitizing equipment. V.Smolej (Max-Planck-Inst. fur Metallkunde, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany).
Prakt. Metallogr. (Germany), vol.20, no.3, p.138-49 (March 1983).
Carefully controlled experiments on a semiautomatic stereological equipment (KONTRON Videoplan with a digitizer tablet as the primary data input device) have shown that factors like different measuring probes (cursor or stylus) and the arrangement of intercepts significantly influence the final results. Usually the errors due to sampling are the main source of variation—besides the original variation of data. These errors are usually much larger than those discussed; thus one can safely assume that the errors due to different measuring probes are negligible, as well as the errors due to intercept arrangement. 06.60 LABORATORY TECHNIQUES

64892 Calculation of the characteristics of an induction-type MHD pump for $R_{m}s>1$ with allowance for the nonuniform distribution of the external magnetic field. R.A.Valdmane, I.R.Kirillov, A.P.Ogorodnikov, V.P.Ostapenko, L.Ya.Ulmanis.
Magnetohydrodynamics (USA), vol.18, no.3, p.293-9 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.98-104 (July-Sept. 1982). [received: April 1983]
One of the features characteristic of a large induction pump with planar or cylindrical channels working at high electromagnetic-interaction parameters ($R_{m}s>1$) is the instability in the homogeneous flow of liquid metal due to the demagnetizing action of the secondary currents. As a result, the velocity profile over the width of the channel becomes inhomogeneous, and the integral characteristics may differ substantially from those calculated in the electrodynamic approximation. This inhomogeneity can be reduced (for $R_{m}s<1$) or accentuated (for $R_{m}s>1$) by design features of the pump, in particular the inhomogeneity in the nonmagnetic gap and by unilateral input (output) of the liquid metal. The authors compare the observed characteristics of a cylindrical induction pump with calculations from various approximate models on the basis of the actual magnetic field distribution. (9 refs.)

06.70 GENERAL INSTRUMENTATION

64893 Fast time-interval 'scope.
Electron. Prod. Des. (GB), vol.4, no.4, p.79-80 (April 1983).
Offering 50 ps accuracy and 10 ps resolution, the HP 1726Z Time-Interval oscilloscope described combines counter and 'scope technologies to make fast, reliable timing measurements on complex, repetitive signals. It has the viewing and measuring capabilities of a 275 MHz oscilloscope and the user features of a time-interval counter, and is intended for applications involving frequent high-precision timing measurements. (no refs.)

64894 Measurement of low oxygen pressures with a solid-state electrolyte miniaturised sensor. F.J.Gutierrez Monreal (Inst. de Electronica de Comunicaciones, CSIC, Madrid, Spain), G.Vitter.
J. Phys. E (GB), vol.16, no.5, p.361-4 (May 1983).
An electrochemical gauge with internal reference is applied for measuring partial oxygen pressures. This device has been applied to measure the oxygen coming from the $H_2+{}^1/_2O_2 \rightleftarrows H_2O$ reaction, made at low oxygen pressures down to 10^{-39} atmospheres ($\approx 10^{-34}$Pa). The results showed that the accuracies obtained were about 1.5% between the measured values and the theoretical ones. The scheme of the gauge and its method of calibration is also presented, taking account of the fact that the internal reference allows the measurement of such low oxygen pressures. (7 refs.)

64895 A sensitive 6-component high-frequency-range balance for building aerodynamics. N.J.Cook (Dept. of the Environment, Garston, Watford, England).
J. Phys. E (GB), vol.16, no.5, p.390-3 (May 1983).
A wind tunnel balance capable of measuring all six components of force and moment at the base of building models over the frequency range <0.00016 Hz to 500 Hz has been built by Kistler Instruments to Building Research Establishment (BRE) specifications. The form and performance of the balance which employs standard piezoelectric force transducers are described, and two examples of typical research applications illustrated. (6 refs.)

64896 Measurement sensors. II. Proximity sensors.
J. Equip. Electr. & Electron. (France), no.485, p.43-4 (Jan.-Feb. 1983). In French.
For pt.I see ibid., no.484, p.53 (1982). Deals with sensors which give an 'on-off' signal as soon as a particular object or 'target' approaches them without actual contact. There are the so-called magnetic switches, inductive sensors, magnetic sensors, the Hall effect sensors which provide a signal of constant amplitude regardless of the speed of passage of the target, photoelectric sensors and ultrasonic sensors, the operating characteristics of all of which are briefly and clearly described. Also provided is a list of leading French manufacturers of the various types of sensor discussed. (no refs.) *G.E.P.*

64897 Versatile new oscilloscopes with DMM and counter functions.
JEE (Japan), vol.20, no.193, p.96-7 (Jan. 1983).
Describes the model SS-5711D oscilloscope, which combines in one unit the new SS-5711, four-channel with 100 MHz band, a low-cost, high-performance oscilloscope, with a four-position, floating-decimal digital multimeter and an eight-position universal counter. With reduced processing time made possible by high-speed components and better software, the operating speed of recent electronic devices has been dramatically increased. For the wideband oscilloscopes needed to measure these faster devices, this and other low-cost 100 MHz oscilloscopes are being marketed. Low cost is attained without sacrificing quality by applying value-engineering techniques, shortening assembly time with improved circuit design, and the introduction of automated manufacturing processes. (no refs.)

64898 Digital memory scopes offer more varied functions. S.Tanaka.
JEE (Japan), vol.20, no.194, p.69-71 (Feb. 1983).
Discusses the digital storage oscilloscope, with a built-in analog-to-digital (A/D) converter-based digital memory which is a waveform-memorizing instrument. The digital memory scope can store waveforms and instantly reproduce them. This feature, not found in conventional oscilloscopes, has been found suitable for fast-changing waveform analyses, especially for transient, single-shot, unexpected phenomena. With its highly valued capabilities, the digital memory scope has drawn increasing market interest. (no refs.)

64899 Determination of the optimum number and disposition of single ferrosonde transducers. L.V.Kapusta, V.A.Tregubov (Voroshilovgrad Engng. Inst., Voroshilovgrad, Ukrainian SSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.618-20 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.44-7 (Aug. 1982). [received: April 1983]
Suggests a method of determining the optimum number and disposition of single ferrosonde transducers in designing multielement ferrosonde transducers for inspecting flat ferromagnetic products. (6 refs.)

64900 The ferrosonde flaw detector DFP-1. N.N.Zatsepin, A.P.Gusev (Inst. of Appl. Phys., Acad. of Sci., Belorussian SSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.651-3 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.79-82 (Aug. 1982). [received: April 1983]
The operating principle of ferrosonde flaw detectors is based on the magnetization of the product parallel to the inspected surface and detecting flaws with the aid of a gradiometric ferrosonde along the normal component of the magnetic field intensity. The flaw detector consists of an electronic unit and a sensor incorporating the functions of magnetizing, scanning and reading. The sensitivity and reliability of the ferrosonde in detecting flaws were verified under laboratory conditions on specimens of various steels with natural and artificial flaws. (8 refs.)

(for measurement in the mechanics of solids and rheology, see 46.30R; for materials testing, see 81.70)

64901 A microcomputer-controlled automatic inverted torsion/flexure pendulum and realtime data processing system for low-frequency internal friction studies. K.Iwasaki (Inst. of Phys. & Chem. Res., Saitama, Japan).
J. Phys. E (GB), vol.16, no.5, p.421-6 (May 1983).
An internal friction measuring apparatus of an inverted pendulum type is developed, in which a specimen is vibrated either in a torsional or in a flexural mode at low frequency. The counterweight of the pendulum can be varied stepwise from outside at any temperature and the specimen elongation is detectable. Fully automatic measurement and realtime data procession are performed with the use of a microcomputer and the experimental results are immediately displayed on a *X-Y* plotter as a graph and on a graphic printer as a data table. 07.20D Thermometry

64902 Noncontact surface temperature measurement during reactive-ion etching using fluorescent polymer films. P.Kolodner, A.Katzir, N.Hartsough (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.749-51 (15 April 1983).
The authors have used a fluorescence technique to make a noncontact surface-temperature measurement on a thin film of glass resin as it is etched away in a reactive-ion-etching chamber. The glass resin is heavily doped with a flourescent material whose fluorescence lifetime is temperature dependent. The fluorescence is excited and collected through a remote optical fiber, and the lifetime is measured using a phase-shift technique. The calibration reproducibility of this measurement is about ± 1°C. The fluorescent glass-resin film could be used as an underlayer for monitoring the etching of overlying oxides, photoresists, or patterned metallizations, or a photoresist itself could be doped with the fluorescer. This demonstration opens up the possibility of surface temperature measurement in a wide variety of harsh environments. (6 refs.)

64903 Transistor transducer for measuring surface temperature. V.M.Karastoyanov.
Elektro Prom.-st. & Priborostr. (Bulgaria), vol.18, no.1, p.20-1 (1983). In Bulgarian.
The author describes the design of a transducer for measuring the surface temperature of bodies, in which a silicon transistor chip is used as thermosensitive element. He describes further the key diagram of the amplifier, the method of calibration, the basic error and the thermal time constant. (3 refs.)

64904 Temperature measurement with thermoelements. W.Taetow.
Funkschau (Germany), no.6, p.53-5 (18 March 1983). In German.
After a general introduction into the conventional methods of measuring temperature by means of a thermoelement, usually by a constantan (Cu-Ni alloy) sensor, compensated by a constant temperature reference (usually a beaker with ice), the simple to use all electronic AD 594 instrument of Analog Devices is described in some detail. The core of the equipment is a single IC, containing a low-drift operational amplifier for the sensor input, the compensating reference sensor with automatic supply voltage control, error detector and summing amplifier, and a final output stage, yielding a test voltage of 10 mV/°C. The thermoelement self-compensation is based on the symmetrical circuit containing three different metal pair sensors. Illustrations comprise block diagrams, a typical readout table, voltage/temperature characteristic (up to 300°C) and circuit arrangements for two typical applications (warning alarm, threshold indicator). (no refs.) *A.L.*

07.20F Calorimetry

64905 Long path length samples in thermal lens calorimetry. C.A.Carter, J.M.Harris (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA).
Appl. Spectrosc. (USA), vol.37, no.2, p.166-72 (March-April 1983).
Laser-induced thermal lens calorimetry as applied to small absorbance determinations has traditionally relied upon the approximation that the sample behaves optically as a thin lens. The choice of a cell length which is not ideal for theory may be necessary for increased sensitivity. Two models for treating long samples of variable absorbance and enhancement are presented. The simpler of these is based on an approximation that such samples will behave according to the integrated position dependence of a thin lens. A more complex model, requiring numerical evaluation, includes the effects of sample refractive index and lens element coupling. (20 refs.)

64906 A new high-precision continuous-heating differential calorimeter for the temperature range 1.5K to 300K. J.W.Loram (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
J. Phys. E (GB), vol.16, no.5, p.367-76 (May 1983).
A method is described in which the ratio of the heat capacities of two samples is measured with an accuracy which approaches $1{:}10^4$ between 20K and 200K, but which decreases to $1{:}10^3$ at 1.5K and 300K. The resolution of the system is very much higher than this, and may approach $1{:}10^6$ over a limited temperature range. The system is extremely simple to operate being the thermal analogue of a Wheatstone bridge, and measurements may be taken rapidly at closely spaced temperature intervals. The construction of the calorimeter, which contains several new features, is also described. (3 refs.)

64907 An isothermal calorimeter with pneumatic compensation—principles and application. L.Ter Minassian, F.Milliou (Lab. de Chimie Phys., Pierre et Marie Curie, Paris, France).
J. Phys. E (GB), vol.16, no.5, p.450-5 (May 1983).
The fundamental principles of pneumatic calorimetry are presented together with a detailed analysis of an experimental application. The apparatus belongs to a new class of instrument based on the reversible liberation of a quantity of heat following a pressure effect exercised on an ideal gas. This device allows the precise measurement of a quantity of heat $+q$ by opposing a known antagonist effect $-q$ determined from the pressure variation. A thermal feedback is realised, wherein the pressure is servocontrolled by a temperature signal. The system allows absolute determinations and is highly accurate and sensitive. Performance, corrections and limitations are studied and discussed. (5 refs.)

Calorimetry and psiumetry .... See Entry 68929

07.20K High-temperature techniques and instrumentation; pyrometry

64908 General method of calculating self-consistent calibration curves for optical pyrometers. B.I.Zinzikov, A.N.Borets (Uzhgorod Univ., Uzhgorod, USSR).
High Temp. (USA), vol.20, no.4, p.613-17 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.733-7 (July-Aug. 1982). [received: April 1983]
The general integral expression for the absolute radiation flux perceived by a pyrometer is transformed by means of incomplete gamma functions into a form suitable for computer use. The temperature dependence of the spectral blackness coefficient of the object is incorporated by making the calibration curves self-consistent. (7 refs.)

07.20M Cryogenics

64909 A horizontal dilution cryostat for polarized targets used in a high intensity photon beam. W.Meyr, K.H.Althoff, O.Kaul, H.Riechert, E.Schilling (Phys. Inst., Univ. Bonn, Bonn, Germany).
AIP Conf. Proc. (USA), no.95, p.517-19 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
A horizontal continuous flow ^{3}He-cryostat was modified to a dilution cryostat with special regard to fast cool-down and easy loading of the target material. This dilution cryostat, built for target asymmetry measurements with a photon beam, has a cooling power of 5 mW at 0.2K, 20 mW at 0.3K and 34 mW at 0.4K. The lowest temperature attained was 175 mK. Target asymmetry measurements of the reaction $\gamma d\uparrow \rightarrow pn$ at $\Theta_{CM}{}^{P}=125°$ were performed using the external photon beam of the Bonn 2.5 GeV electron synchrotron. As target material the authors used D-butanol ($C_4D_{10}O$) with a maximum deuteron polarization of 27% in a magnetic field of 2.5 T. Under the same conditions deuterons in D-ammonia (ND_3) could be polarized up to 30%. (8 refs.)

64910 Measurement of friction factors for the flow of gases in very fine channels used for microminiature Joule-Thomson refrigerators. W.Peiyi, W.A.Little (Phys. Dept., Stanford Univ., Stanford, CA, USA).
Cryogenics (GB), vol.23, no.5, p.273-7 (May 1983).
The friction factors for the flow of gases in the fine channels used for microminiature Joule-Thomson refrigerators have been measured. The test channels were fabricated using a photolithographic technique. The width of the channels were 130 to 200 microns and the depth 30 to 60 microns. The tests involved both laminar and turbulent flow regimes. The results obtained show some interesting characteristics of flow resistance for very fine channels. These differ from ones for common pipes because of the large relative roughness and asymmetric roughness. (10 refs.)

64911 An inexpensive liquid helium level sensing unit. S.C.Bapna, M.Pravinkumar, M.Thirumaleshwar (Cryogenics Section, Bhabia Atomic Res. Centre, Bombay, India).
Cryogenics (GB), vol.23, no.5, p.278-9 (May 1983).
Two units to measure the level of liquid helium in a superconducting magnet and in a storage Dewar are described. (3 refs.)

64912 Characterization of multilayer insulation at cryogenic temperature. H.Kishan, R.B.Saxena, M.L.Sharma, R.G.Sharma (Nat. Phys. Lab., New Delhi, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.965-8 (Dec. 1982). [received: April 1983]
Apparent thermal conductivity ($\bar{k}$) measurements have been carried out on multilayer insulation or the so called superinsulation consisting of alternate layers of indigenous aluminium foil (9 μm thick) and 'Dexter' fibre glass paper (170 μm thick) between the boundary temperatures of 300 and 77K under varying gas pressure and layer density. An NBS-type double-guarded calorimeter fabricated at the laboratory has been used for these studies. The heat transfer through the insulation has been measured in terms of the rate of evaporation of liquid nitrogen in the test vessel by the usual method of a water bubbler and a wet gas flow meter. No better material has been used in the calorimeter during the measurements. A minimum value of $k \simeq 0.38$ μW cm^{-1} K^{-1} has been obtained for a density of 24 layers/cm and at a pressure of 2.5×10^{-5} torr. (10 refs.)

64913 Recent progress in ^{4}He-circulating dilution refrigerators. T.Sato, N.Sato.
Solid State Phys. (Japan), vol.18, no.1, p.47-5 (Jan. 1983). In Japanese.
After reviewing the problems in a ^{4}He-circulating dilution refrigerator, the authors present results of their recent investigation and also those of the Leiden group. (3 refs.)

07.50 ELECTRICAL INSTRUMENTS AND TECHNIQUES

64915 Problems of the theory and design of electromagnetic mechanisms with flat printed coil. D.S.Rusev.
Elektro Prom.-st. & Priborostr. (Bulgaria), vol.18, no.1, p.17-19 (1983). In Bulgarian.
An expression for the driving torque of electromagnetic measuring mechanisms with printed coil is deduced. The efficiency of the most internal windings of the printed coil is evaluated. The obtained results are a basis for the design of mechanisms with optimum geometric configuration. (4 refs.)

64916 Measurement of the electrical conductivity of liquid metals by the eddy-current method. S.N.Zhuravlev, O.I.Ostrovskii, V.A.Grigoryan (Moscow Inst. of Steels & Alloys, Moscow, USSR).
High Temp. (USA), vol.20, no.4, p.551-5 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.665-70 (July-Aug. 1982). [received: April 1983]
A procedure is introduced for using the eddy-current method to investigate the electrical conductivity of metallic melts at high temperatures. The problems influencing the accuracy of the measurements are considered and ways of eliminating them are discussed. The measurement scheme and construction of the apparatus are described. Results are presented for measurements of the electrical resistance of liquid Fe, Co and Ni. The data obtained agree with the results of measurements by the rotating magnetic field method. (13 refs.)

64917 Measurements of high voltages by means of electron speed filtering. D.H.Kind, W.Lucas, D.Peier, B.Schulz (Phys. Tech. Bundesanstalt, Braunschweig, Germany).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.8-11 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
A cavity resonator is used as an electron speed filtering system. Discrete resonance values of the accelerating voltage can be calculated analytically. The device can, therefore, be used to build up a high-voltage scale with low uncertainty. Experimental investigations have shown good agreement with theory. Five current peaks generated by electrons which passed the resonator could be detected in the voltage range between 40 and 100 kV. They indicated a balanced condition of the electron speed filter, at which the accelerating voltages are calculable. These discrete voltages are nonequidistant, thus the measurement is unambiguous. Further developments are necessary and envisaged in order to considerably reduce the uncertainty. The goal is a measuring device using a superconducting niobium resonator which can be used to realize an absolute voltage scale up to 100-kV DC with a relative uncertainty of better than $\pm 10^{-5}$. (9 refs.)

64918 Contactless resistivity measurements under high pressure. B.Sundqvist, B.Lundberg (Dept. of Phys., Univ. of Umea, Umea, Sweden).
J. Phys. E (GB), vol.16, no.5, p.408-11 (May 1983).
For the first time, a contactless inductive method has been devised for measurements of the electrical conductivity of metallic materials under very high pressures (>1 GPa). A sample in the form of a thin disc is placed in a pick-up coil in a steady-state AC magnetic field. The output voltage from the coil is analysed with a lock-in amplifier to find the component due to eddy currents in the sample, from which the conductivity is calculated, using a semi-empirical expression. The influence of the steel pressure vessel is eliminated by making simultaneous measurements on a known reference material. Experimental results are shown for tin and sodium up to 1.3 GPa. (14 refs.)

64919 High-resolution probing of surface-charge distributions on electret samples. R.Gerhard-Multhaupt, W.Petry (Inst. for Electroacoustics, Tech,. Univ. of Darmstadt, Darmstadt, Germany).
J. Phys. E (GB), vol.16, no.5, p.418-20 (May 1983).
A scanning capacitive probe for the measurement of surface-charge distributions on electret foils is described. The resolution of the method is better than 100 μm, and surface potentials of up to 1.4 kV can be detected. Surface-charge patterns on corona-charged Teflon FEP electrets are given as examples. (14 refs.)

64920 Measurement of the conductivity of semiconductor disks in the SHF range. A.B.Davydov, N.I.Solin, G.L.Shtrapenin (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.666-8 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.95-6 (Aug. 1982). [received: April 1983]
The inhomogeneity of the superhigh frequency (SHF) field, occurring in semiconductor specimens, does not permit the application of quasistatic approximation for measuring ϵ' if the thickness of the specimen exceeds 0.3 k^{-1}. However, conductivity can be measured with an accuracy of 10-15% in specimens with thickness $d \lesssim k^{-1}$. The depolarization factor of the disk is ~30% larger than the depolarization factor of the ellipsoid of revolution in which the ratio of the axes is equal to the ratio of the thickness of the disk to its diameter. (7 refs.)

07.55 MAGNETIC INSTRUMENTS AND TECHNIQUES

64921 Magnetic field effect measurements by time-selective absorption sampling. R.Treichel, H.Staerk, A.Weller (Abt. Spektroskopie, Max-Planck-Inst. fur Biophys. Chemie, Gottingen, Germany).

Appl. Phys. B (Germany), vol.B31, no.1, p.15-17 (May 1983).

An absorption method which permits time-selective measurements at different wavelengths has been developed in order to explore magnetic field effects on photoinduced electron transfer reactions in linked and unlinked donor-acceptor systems. (9 refs.)

64922 A capacitive instrument for the measurement of magnetostriction in pulsed fields. J.Heremans (Unite de Physico-Chimie et Phys. de l'Etat Solide, Univ. Catholique de Louvain, Louvain-le-Neuve, Belgium), J.-P.Michenaud, Y.Iye, N.Miura, G.Kido, K.Nakamura, S.Tanuma.

J. Phys. E (GB), vol.16, no.5, p.382-6 (May 1983).

The well known capacitive method for measuring small displacements has been widely used for magnetostriction measurements in steady or slowly varying magnetic fields. In pulsed fields this sensitive method cannot be used without severe precautions, owing to mechanical and electrical noises generated by the pulse. A special capacitive bridge instrument manageable in high pulsed fields is described. It has been successfully tested for measuring magnetostriction of bismuth up to 40T. (12 refs.)

64923 Magnetic-fluid density spectrometer with constant $(H^{\copyright})H$. V.Jusan, L.Homoradean (Inst. of Mines, Petrosani, Rumania).

Magnetohydrodynamics (USA), vol.18, no.3, p.325-9 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.133-6 (July-Sept. 1982). [received: April 1983]

Magnetic-fluid density spectrometers operate on the basis of the ability of nonmagnetic bodies immersed in a magnetic flu in a nonuniform magnetic field to seek the sites of minimum magnetic field intensity. Such devices offer several advantages over other devices, namely: they can operate continuously in high-yield production plants, they are inexpensive to build and require very small amounts of magnetic fluid, they are suitable for use in closed containers, and they do not require additional consumption of materials. Loss of magnetic fluid in a magnetic-fluid spectrometer can be completely eliminated by preliminary treatment of the mixture with a substance impermeable to the magnetic fluid. (4 refs.)

64924 Stimulated echo NMR spectra and their use for heteronuclear two-dimensional shift correlation. A.G.Redfield (Depts. of Phys. & Biochem., Brandeis Univ., Waltham, MA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.537-40 (22 April 1983).

NMR spectra are obtained from Fourier transformation of the latter part of a Hahn stimulated echo. The sequence is $90°\text{-}\tau_a\text{-}90°\text{-}\tau_b\text{-}90°\text{-}\tau_a$-digitize versus τ_2. This is demonstrated for transfer RNA in H_2O using the semiselective J&R pulse ($90°\text{-}\tau_p\text{-}90°$), developed by Plateau and Gueron in place of each 90° pulse. 2D correlation between ^{15}N and protons is obtained by applying a $90°\text{-}\tau_1\text{-}90°$ ^{15}N sequence during τ_b and ^{15}N decoupling while digitizing. The second Fourier transform is performed with respect to τ_1 after discarding the imaginary parts of the first transform, to obtain a real 2D map. Such a 2D spectrum has been obtained for 5 mM $^{15}NH_4Cl$ and several other small molecules. The sequence should be useful for studies of ^{15}N labeled macromolecules. (14 refs.)

64925 Sensitivity of V_2' saturation transfer electron paramagnetic resonance signals to anisotropic rotational diffusion with [^{15}N] nitroxide spin-labels. Effects of noncoincident magnetic and diffusion tensor principal axes. A.H.Beth, K.Balasubramanian (Depts. of Physiology & Chem., Vanderbilt Univ., Nashville, IN, USA), B.H.Robinson, L.R.Dalton, S.D.Venkataramu, J.H.Park.

J. Phys. Chem. (USA), vol.87, no.2, p.359-67 (20 Jan. 1983).

The authors examined the sensitivity of the widely employed second harmonic out-of-phase absorption EPR signal (V_2') recorded under conditions of partially saturating microwave and nonlinear Zeeman modulation fields to anisotropic Brownian rotational diffusion at X-(9.45 GHz) and K-band (22.0 GHz) microwave frequencies. [^{15}N,^2H] spin-labels were used in order to minimize computation times and provide high resolution of major and minor element spectral structurings. (22 refs.)

64926 Dynamical averaging of two symmetry-related magnetic resonance tensors in single crystals. S.K.Hoffmann, L.S.Szczepaniak (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).

J. Magn. Resonance (USA), vol.52, no.2, p.182-92 (April 1983).

Parameters of dynamically averaged EPR and NMR spectra are calculated. The formulae, relating averaged crystal tensor components and local molecular tensors for two identical resonance centers in crystals of C_2, C_{2h} or C_{2v} symmetry, are presented. The cases of the g^2 tensor in EPR spectra of Cu(II) ions and the quadrupole coupling gQq tensor in NMR of deuterons are discussed. (21 refs.)

64927 Obtaining high-fidelity spin 1/2 powder spectra in anisotropic media: phase-cycled Hahn Echo spectroscopy. M.Rance, R.A.Byrd (Div. of Biological Sci., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).

J. Magn. Resonance (USA), vol.52, no.2, p.221-40 (April 1983).

In the spectroscopy of isolated spin-1 nuclei in anisotropic media, the spectral distortion resulting from the inability to record the initial part of the free-induction decay was eliminated by using the quadrupolar echo technique. Wideline spin-1/2 spectroscopy is subject to the same problems associated with finite receiver recovery time as is spin-1 spectroscopy; however, these problems have been generally ignored in the past. Through the use of a very simple and well-known pulse sequence ($90°\text{-}\tau\text{-}180°$) the chemical shift interaction, among others, can be refocused to generate a so-called Hahn echo. If magnetic dipolar interactions with like nuclei and fluctuating interactions with other nuclei may be neglected, then the refocusing of the magnetization will be complete and an undistorted spin-1/2 powder spectrum can be obtained by Fourier transforming the signal starting at the peak of the echo. The practical aspects of implementing the Hahn echo technique are discussed. A phase-cycling scheme is proposed to prevent spectral distortion due to misset pulse lengths. The effects of finite pulse lengths are investigated, and the theoretical single pulse and echo distortion factors are demonstrated to differ from those which were determined for quadrupolar echo spectroscopy. Experimental verification of some of the theoretical predictions is provided. (21 refs.)

64928 Nuclear magnetic resonance flip-angle effects: observability of multipole operators. L.Werbelow (Dept. of Chem., New Mexico Inst. of Mining & Technol., Socorro, NM, USA).

J. Magn. Resonance (USA), vol.52, no.2, p.282-7 (April 1983).

General FTNMR sampling-pulse flip-angle dependences of diagonal multipole operators are derived and discussed. Although the FT sampling pulse does not mix multipoles of different rank, each multipole is characterized by a unique flip angle where the intensity of this multipole is rendered unobservable. The simple expressions presented are equally valid for multipolar spin systems or multiply degenerate, multispin dipolar, or quadrupolar systems. (10 refs.)

64929 A simple method for simultaneous homo- and heteronuclear decoupling on FT-NMR spectrometers. R.Nunlist, J.D.Arenivar (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Magn. Resonance (USA), vol.52, no.2, p.305-7 (April 1983).

Analysis of complex spectra relies on a variety of decoupling experiments designed to simplify the observed resonances into interpretable pieces of the total spin system. Nuclei other than protons usually lead to simple noise-decoupled spectra due to the large chemical shifts of the observed lines. However, increasing sophistication of molecules having complex heteronuclear spectra requires similar techniques for simplifying the observed lines. Some efforts have been made to analyze these systems using two-dimensional J spectra, but the large coupling constant range, long T_1 relaxation times, and data storage and computing requirements make this experiment inconvenient. The authors have developed a 'triple-resonance' experiment combining proton broadband decoupling with selective homonuclear decoupling for use with standard FT-NMR spectrometers. (4 refs.)

64930 Fast and economical treatment of 2D NMR data. A.G.Redfield (Dept. of Phys. & Biochem., Brandeis Univ., Waltham, MA, USA).

J. Magn. Resonance (USA), vol.52, no.2, p.310-12 (April 1983).

The author was faced with the desire to do 2D FT with limited and slow mass storage, namely, a single LINCTAPE magnetic tape unit (similar to DECTAPE) with about 300-kbyte capacity. While this represents an unusual problem, its solution may be of interest to others. He can now do 2D FT runs (75000 output points maximum limited by the tape capacity) in which about 20% of the run is wasted waiting for tape storage and rewinding, and in which a substantial portion of the output map (about 16000 points) can be read out and processed in about 2 minutes. Currently he has only a sequential one-dimensional display of the two-dimensional spectrum; an intensity display would require no extra time but of course calculation of a contour display would require time. If implemented on a disk, the processing times would be negligible. (4 refs.)

64931 A broadband radiofrequency reflected-wave detector and its application to a nuclear magnetic resonance spectrometer. R.W.Dykstra (Union Carbide Corp., South Charleston, WV, USA).

J. Magn. Resonance (USA), vol.52, no.2, p.313-17 (April 1983).

Intense radiofrequency (RF) magnetic fields for proton decoupling and sensitivity enhancement techniques and high-speed sample rotation are basic features of nuclear magnetic resonance spectrometers used for studies of solids. Due to the higher RF power requirement for solid-state NMR (up to several kilowatts) compared to the typical RF power used for liquid-phase samples (40 to 100 W), some conditions which create a nuisance when acquiring liquid-phase spectra (a broken sample tube in the probe or high humidity which can upset a low-temperature experiment) can result in a catastrophic failure. Poor cable connections, faulty cables, dielectric breakdown (arcing) resulting from high humidity in the NMR probe in the presence of the high-voltage RF excitation pulse, and disintegration of the sample rotor due to forces caused by high rotation rates are some of the conditions that may be expected in normal use and will cause adverse effects in the RF transmission path. A circuit which detects an increase in the amplitude of an RF reflected wave is reported. The circuit is usable from 10 to 500 MHz and has a built-in capability which allows the user to preset a variable threshold over a range from 50 mW to 100 W. (11 refs.)

64932 Frequency versus field modulation in magnetic resonance. A.Dulcic, B.Rakvin (Ruder Boskovic Inst., Univ. of Zagreb, Zagreb, Yugoslavia).

J. Magn. Resonance (USA), vol.52, no.2, p.323-5 (April 1983).

Modulation is a very important technique in magnetic resonance experiments. It is generally used to improve sensitivity. Modulation effects can also be used to extract relaxation parameters from the experimental data. Depending on the type of modulation, the effects can be nontrivial so that a better knowledge of the processes involved may lead to new applications. Recently, Kim (1982) analyzed the production of sideband and harmonic structure in the observed signal under conditions of frequency and field modulation. His findings are in contradiction with the classical review article on modulation effects in magnetic resonance by Haworth and Richards (1966). In view of the modulation technique the authors attempt to resolve that controversy. (6 refs.)

64933 Heteronuclear zero quantum spectroscopy as a conformational probe. P.H.Bolton (Chem. Dept., Wesleyan Univ., Middletown, CT, USA).

J. Magn. Resonance (USA), vol.52, no.2, p.326-9 (April 1983).

Investigations of the conformations of molecules in liquids are often aided by the information present in the proton NMR spectrum of the sample. The proton chemical shifts and proton-proton couplings often contain sufficient information for determination of the structural features of interest. However, in many cases the proton spectrum is obscured by the signals from solvent or an enzyme or by overlap of signals from the molecule being studied. One approach to overcoming this problem is to use heteronuclear two-dimensional NMR to detect indirectly the proton spectral information. The heteronuclear two-dimensional NMR method can be used to obtain proton spectra of sufficient quality to answer conformational questions. Another approach to spying on protons is to use heteronuclear multiple quantum spectroscopy. Since indirect detection of protons is of use in examining the conformations and structures of molecules where conventional approaches fail, it was of interest to begin an investigation of the merits of multiple quantum spectroscopy relative to heteronuclear two-dimensional NMR. Zero quantum spectroscopy, in particular, appears to be quite promising. The linewidths obtained in the crucial domain containing the proton information are only weakly dependent on the field homogeneity. A more advantageous feature is that the proton spectra obtained via heteronuclear zero quantum spectroscopy correspond to the heteronuclear decoupled proton spectrum when only one proton is coupled to the heteronucleus. (12 refs.)

64934 Determination of heteronuclear coupling constants via semiselective two-dimensional J spectroscopy. A.Bax (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).

J. Magn. Resonance (USA), vol.52, no.2, p.330-4 (April 1983).

The use of the original 2D J-spectroscopy experiments for the exact determination of coupling constants requires a very fine digitization along the F_1 frequency axis; this leads to a very large size of the required data matrix, unless the acquisition time along the t_2 axis is made very short, which in turn decreases the sensitivity of the experiment dramatically. The intensity of a certain carbon-13 nucleus in this high-F_1-resolution application will generally be spread over a large number of multiplet components, which decreases the sensitivity even further. All problems mentioned above can be overcome by using a modified version of the proton-flip experiment in which only one proton is 'flipped' by the proton pulse (which in this case is selective) in the center of the evolution period. The author describes two experiments which rely on the same principle as the selective proton-flip experiment and which allow the accurate determination of either all direct ^{1}H-^{13}C coupling constants by removal of the long-range splittings or the determination of all long-range couplings while removing all the direct ^{1}H-^{13}C splittings. (16 refs.)

64935 An improved sequence for broadband decoupling: WALTZ-16. A.J.Shaka, J.Keeler, T.Frenkiel, R.Freeman (Phys. Chem. Lab., Oxford Univ., Oxford, England).
J. Magn. Resonance (USA), vol.52, no.2, p.335-8 (April 1983).
The principal criteria for decoupling performance are (a) wide effective proton bandwidth for a given power dissipation, (b) residual splittings of carbon-13 small compared with the line width, (c) insensitivity to pulse length error or B_2 inhomogeneity, (d) insensitivity to errors in the radiofrequency phase shifts, (e) negligible sidebands due to sampling within the decoupling cycle, and (f) programming simplicity. With these criteria in mind, a search was made for better decoupling sequences, using computer simulation to predict the residual splitting as a function of proton resonance offset. The culmination of this search was a new spin inversion sequence. (10 refs.)

64936 Improvement in the cross-polarization NMR experiment for suppression of rigid protonated carbons. P.Dubois Murphy (Magnetic Resonance Group, IBM Instruments Inc., Danbury, CT, USA).
J. Magn. Resonance (USA), vol.52, no.2, p.343-5 (April 1983).
A very useful NMR experiment for solids simply requires the use of a calculated delay for the decoupling pulse. For a proper choice of the decoupler delay T_D, singly or doubly protonated carbons can usually be suppressed from the carbon-13 NMR spectrum. Owing to their usually rapid motion at room temperatures, triply protonated carbons (methyl groups) are usually not suppressed as easily. This experiment has received varius titles such as 'dipolar dephasing' or 'interrupted decoupler'. One problem with this experiment is that the decoupler delay time T_D introduces an additional linear phase error in the observed NMR spectrum if the signal digitizer is triggered at the end of the delay. Alternately, if the digitization is begun prior to the delay, the additional linear phase error can be avoided at the expense of possibly recording (1) the would-be suppressed carbon signals and (2) an RF transient when the decoupler pulse is activated. If a chemical-shift refocusing pulse is added to the rare-spin pulse sequence at the center of the decoupler delay T_D, then the digitization can begin at the end of the delay without the undesired linear phase error. (7 refs.)

64937 Pulsed microwave microwave double resonance spectroscopy with Fourier transform technique. G.Bestmann, H.Dreizler (Abteilung Chem. Phys., Univ. Kiel, Kiel, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.452-8 (April 1983).
Presents a new three and four level double resonance spectroscopy in the microwave region. A pulsed pump radiation and Fourier transform technique for detection of the signal radiation is used. This method is complementary to that using continuous microwave pump radiation. (5 refs.)

J. Opt. (France), vol.14, no.1, p.19-23 (Jan.-Feb. 1983).
Recently optical methods for roughness measurement have been developed. However, most of them only enable the usual criteria Ra and Rt to be determined. A method is presented based upon the defocusing of a white light beam. This method enables one to determine any statistical parameters, profiles or 3D images of the surface being measured. Results obtained are compared with those determined with a technical stylus for samples of various roughness. (9 refs.)

64939 Accuracy of an optical open area ratiometer. F.M.Dickey, B.W.Jones (Boeing Military Airplane Co., Wichita, KS, USA).
Opt. Eng. (USA), vol.22, no.2, p.275 (March-April 1983).
An optical open area ratiometer for measuring the percent open area of perforated sheet materials has been developed. The devices uses a technique based on Fourier optics in which a detector is employed to measure a small central portion of the light in the Fraunhofer diffraction pattern of the perforated sheet. This paper discusses the associated problems and results of testing the accuracy of the device. The accuracy is shown to be on the order of 2% of the open area ratio. (1 ref.)

64941 Processor controlled multichannel microdensitometry for gas electron diffraction patterns. D.W.Paul, J.D.Ewbank, O.J.Benston, L.Schafer (Dept. of Chem., Univ. of Arkansas, Fayetteville, AR, USA).
Appl. Spectrosc. (USA), vol.37, no.2, p.127-30 (March-April 1983).
The design of a novel type of densitometer for evaluating photographic plates from gas electron diffraction is described. A commercially available linear diode array has been interfaced to a PDP-11/23 minicomputer via the DRV11 parallel interface. The diffraction pattern from a photographic plate is optically focused onto a solid state linear photodiode array. The position of each diode in the array provides the radial location information and the radial intensity of each diode is digitized with 14-bit resolution. The instrument allows for faster data recording since the total pattern is determined in one scanning measurement. (22 refs.)

07.60F Polarimetry and ellipsometry

64942 Ellipsometric studies of rough silicon surfaces. R.B.Bendere, R.P.Kalnynya, I.A.Feltyn.
Opt. & Spectrosc. (USA), vol.53, no.3, p.299-301 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.507-11 (Sept. 1982). [received: May 1983]
The possibility of ellipsometric determination of the parameters of microroughnesses of rough silicon surfaces was examined. It was shown on the basis of investigations of rough surfaces of two types that with an established form of roughness ellipsometric methods give results agreeing well with microscopic investigations. To determine the type of roughness the use of immersion ellipsometry is proposed. (7 refs.)

07.60H Refractometry and reflectometry

64943 Refractive-index measurement of bulk materials: prism coupling method. H.Onodera, I.Awai, J.Ikenoue (Electronics Dept., Kyoto Univ., Kyoto, Japan).
Appl. Opt. (USA), vol.22, no.8, p.1194-7 (15 April 1983).
A simple method of measuring refractive indices of bulk materials using a prism coupling procedure is described. Refractive indices are determined from the measurement of the angle incident to the prism at which total reflection on the prism base breaks. This method is shown to possess the advantages of its simple procedure and sample preparation. The accuracy is comparable with that of minimum deviation method if the prism is well calibrated. Experimental results for several materials are given with an evaluation of possible errors. (4 refs.)

64944 Simple method for measuring the refractive index of a liquid or glass wedge. M.V.R.K.Murty (Centro de Investigaciones en Optica AC, Leon, Mexico), R.P.Shukla.
Opt. Eng. (USA), vol.22, no.2, p.227-30 (March-April 1983).
Describes a simple method of measuring the refractive index of a liquid. The basic element is a thin wedge cell, and the source of light is a low power He-Ne laser. Conditions are derived to obtain the best possible accuracy using this setup. The same setup can also be used for the determination of the refractive index of a solid medium such as glass. (2 refs.)

07.60L Interferometry

64945 Double-pass oblique-incidence interferometer for the inspection of nonoptical surfaces. I.J.Wilson (CSIRO Div. of Chem. Phys., Clayton, Victoria, Australia).
Appl. Opt. (USA), vol.22, no.8, p.1144-8 (15 April 1983).
Interferometric testing of the flatness or straightness of ground surfaces of metals, granite, ceramics, and glasses has always proved difficult because of the extremely low specular reflection from these optically rough surfaces. At oblique angles of incidence the specular reflection coefficient of nonoptical surfaces increases rapidly, typically from near 0.01 at 75° up to, say, 0.50 at 85° and near 1.00 at 90° angle of incidence. By taking advantage of this enhanced reflection at oblique incidence and the brightness and spatial coherence of visible gas lasers, it becomes practical to use interferometric inspection of nonoptical surfaces. A novel double-pass oblique-incidence interfe-

rometer is described which enables testing of large pieces having a specular reflection as low as 1%. (4 refs.)

64946 A moire fringe alignment aid. G.T.Reid (Nat. Engng. Lab., Glasgow, Scotland).
Opt. & Lasers Eng. (GB), vol.4, no.2, p.121-6 (1983).
The task of accurately superimposing two photographic transparencies is frequently encountered in some areas of optical metrology. By recording a suitable line structure, along with the image on each photograph, moire fringes formed when two of the structures are superimposed can be used to give an accurate indication of the alignment of the transparencies. (5 refs.)

64947 Moire quasi-interferometry. L.Liu (Univ. Oldenburg, Oldenburg, Germany).
Opt. Commun. (Netherlands), vol.45, no.4, p.215-20 (15 April 1983).
Two kinds of moire techniques with double exposures in quasi-interferometry are developed. In the form of moire fringes, one method is for measuring the change of the phase gradient in the test object and another to obtain higher-order phase derivatives. Theoretical analyses and experiments about some interesting applications are given. (10 refs.)

64948 Comparative analysis of optical characteristics of double-beam and multiple-beam selective interferometers. A.I.Lopatin, A.V.Laletin.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.472-5 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.4-6 (Aug. 1982). [received: April 1983]
Formulas are given that describe the transmittance of a multiple-beam selective interferometer ignoring losses. The relationship between its basic optical characteristics and the reflectivity of the diffraction gratings used is shown. The described instrument is compared with a double-beam SISAM and a Fabry-Perot interferometer. (3 refs.)

07.60P Optical microscopy

64949 Theoretical studies on optical coherent microscopes. J.J.Clair, A.M.Hamed (Ecole Nat. Superieure de l'Electronique et de ses Applications, Cergy, France).
Optik (Germany), vol.64, no.2, p.133-41 (May 1983).
Presents a theoretical analysis of the confocal coherent microscope. The authors have calculated the total impulse response for two symmetric pupils having a conic amplitude distribution, and analytic formulae are given. Also, calculations are made using combinations of different shapes for the collector and objective lenses, and the image for a point object is calculated in all cases which shows that further improvement in resolution can be attained by using pupils of conic and annular amplitude distribution for the objective and collector lenses of the coherent microscope. Finally, the authors analyse a spatially coherent microscope for the purpose of processing microscopic information. (14 refs.)

64950 Optical microscopy with extended depth of field. C.J.R.Sheppard, D.K.Hamilton, I.J.Cox (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.171-86 (8 May 1983).
A method is described that allows the depth of field in optical microscopy to be extended, in principle without limit, while high-resolution, diffraction-limited imaging is retained. Experimentally, an extension of more than two orders of magnitude has been achieved. The images are found to be of high optical quality, and this is borne out by theoretical predictions. The resolution is shown theoretically to be similar to that in a conventional microscope of the same numerical aperture, and for some criteria an improvement is obtained. (11 refs.)

64951 Observation of a photoionic image in a laser desorption microscope. V.S.Letokhov, V.S.Likhachev, V.G.Movshev, S.V.Chekalin (Inst. of Spectroscopy, Acad. of Sci., Troitsk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1377-8 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2117-18 (Nov. 1982). [received: May 1983]
A magnified photoionic image of a target irradiated with ultrashort laser pulses of different wavelengths was observed with the aid of a laser desorption microscope. (4 refs.)

07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

64952 Silicon detector nonlinearity and related effects. A.R.Schaefer, E.F.Zalewski, J.Geist (Radiometric Phys. Div., US NBS, Washington, DC, USA).
Appl. Opt. (USA), vol.22, no.8, p.1232-6 (15 April 1983).
An explanation is put forth for the observed nonlinearity in the red spectral region of the response of silicon photodiodes. Experiments are described to support the explanation; and the results, implications, and precautions indicated for the use of these diodes are given. Correlation of nonlinearity with spatial nonuniformity of response is demonstrated. (10 refs.)

64953 Calculation of fast-response low-temperature bolometers on a solid substrate. I.A.Khrebtov.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.469-72 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.1-4 (Aug. 1982). [received: April 1983]
The temperature sensitivity of fast-response low-temperature bolometers on a solid substrate is calculated by the electrothermal analogy method with the boundary thermal resistance taken into account. The character of the variation of the bolometer sensitivity is analyzed in the frequency interval $\omega = 10^{-2}$-10^{-8} rad^{-1} and in the 1-300K temperature region for different combinations of materials for the heat insulating interlayer and base and for different geometrical dimensions of these structures. 07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

64954 Exact interpolation of Fourier transform spectra. C.Giancaspro, M.B.Comisarow (Dept. of Chem., Univ. of British Columbia, Vancouver, British Columbia, Canada).
Appl. Spectrosc. (USA), vol.37, no.2, p.153-66 (March-April 1983).
A systematic study of interpolation of Fourier transform (FT) spectra is reported. Interpolation errors are examined for both frequency determination and intensity determination for different interpolation procedures for both absorption mode and magnitude mode FT spectra. The errors are presented in both analytical and graphical form as functions of the number of zero-fillings and (T/τ), the ratio of the acquisition time to the relaxation time of the time domain signal. (29 refs.)

64955 Microcomputer controlled flash photometry with submicrosecond resolution and Raman spectroscopy. Z.Meiri, Y.Berezin, A.Shemesh, B.Ehrenberg (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel).
Appl. Spectrosc. (USA), vol.37, no.2, p.203-7 (March-April 1983).
The interfacing of two spectrophotometric systems to an Apple II microcomputer is described. The first is a flash photometric setup in which light flashes are formed either with a chopper wheel, or with an acousto-optic modulator which is activated by the microcomputer. Spectroscopic transients are monitored with a time resolution as short as 250 ns, by counting photon pulses into the computer's memory in the fast direct memory access mode. A microcomputer-controlled Raman spectrometer, in which the Apple II is interfaced to a Spex monochromator and the photon counting electronics, is also described. (9 refs.)

64956 Reflecting Schmidt imaging spectrometers. J.B.Breckinridge, N.A.Page (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), R.R.Shannon, J.M.Rodgers.
Appl. Opt. (USA), vol.22, no.8, p.1175-80 (15 April 1983).
A new very wide angle imaging spectrometer optical configuration which uses an all-reflecting Schmidt camera with a prism spectrometer to give a strip field of view is presented. Three complete systems (15°, 8.5°, 2.6° FOV), including fore optics and spectrometer optics, were designed. These slit fields of view are pushbroomed across object space to create a 2-D image. The performance of each near diffraction-limited system and optical prescriptions is detailed. An all-reflecting Schmidt camera fore-optics system with a 60° field of view is also given. (15 refs.)

64957 Polarization spectroscopy of gaseous media by the photon-echo method. I.V.Evseev (Moscow Engng. Phys. Inst., Moscow, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.614-19 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.182-7 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
The photon echo phenomenon has been transformed in recent years into one of the most effective methods in nonlinear laser spectroscopy. It can be used to identify the corresponding resonance transitions, and also to obtain experimental data on the relaxation properties of resonance transitions and levels. Polarization spectroscopy of gaseous media by the photon-echo technique, i.e. the study of the polarization properties of the photon echo and of its different varieties, appears to be particularly promising. This is so because polarization measurements are more accurate than intensity measurements, since they are not affected by possible fluctuations in the intensities of the light pulses exciting the medium. (56 refs.)

64958 A realtime ruby luminescence spectrometer for pressure determinations. K.R.Hirsch, W.B.Holzapfel (Experimentalphys. Univ. GH-Paderborn, Paderborn, Germany).
J. Phys. E (GB), vol.16, no.5, p.412-17 (May 1983).
A design of a spectrometer system with a fixed self-focusing grating and a linear diode array (Reticon 512G) is described, where a microprocessor directly evaluates the pressure in realtime from ruby luminescence spectra at a typical repetition rate of 2 scans per second and a precision of better than ±0.025 GPa over a range of nearly 50 GPa. A self-calibration procedure allows for reliability tests of the instrument at any time. As an application a time-resolved isochoric study of the pressure behaviour at the phase boundary between ice VI and the liquid is shown. (6 refs.)

64959 Change in Fourier spectrometer aperture in interferogram recording. B.N.Grechushnikov, G.V.Vladimirtsev, S.V.Koryshev.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.760-2 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.38-41 (July 1982). [received: March 1983]
Ways are considered of recording and processing patterns measured with a Fourier spectrometer with a varying aperture and estimates given of the possible gain in the signal-to-noise ratio. (3 refs.)

64960 Measurement of absorption coefficients of highly transparent solids by emission spectroscopy. A.V.Vasil'ev, E.M.Dianov, V.G.Plotnichenko.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.820-3 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.112-16 (July 1982). [received: March 1983]
In the described method the emission spectrum I_λ of the specimen is investigated instead of the transmission spectrum T_λ, and the absorption coefficients of the specimen can be calculated from an analysis of the emission spectrum. (7 refs.)

64961 Time resolved high resolution spectroscopy using the high frequency deflection technique and supersonic jet targets. I. Instrumental; simplification of spectra; reductions of collisional quenching. P.Erman, O.Gustafsson, M.Larsson (Dept. of Phys., Royal Inst. of Technol., Stockholm, Sweden).
Phys. Scr. (Sweden), vol.27, no.3, p.192-200 (March 1983).
A supersonic jet gas target arrangement has been designed and tested in high resolution lifetime measurements using the high frequency deflection technique. Rotational temperatures down to 15K are obtained at target pressures up to 1 torr and a hundredfold decrease of distortions due to collisional quenching is observed as compared to ordinary static gas targets. These improvements enable registrations of almost rotationless molecular spectra at high intensities without collisional quenching which greatly extend the versatility of this time resolved technique. (24 refs.)

64962 The scope for applying image converter in spectroscopy. V.Kapicka, Z.Ondracek (J.E. Purkyne Univ. Brno, Brno, Czechoslovakia).
Scr. Fac. Sci. Nat. Univ. Purkynianae Brunensis Phys. (Czechoslovakia), vol.12, no.9, p.431-4 (1982). In German.
Brief details of the RCA image converter, type 4550 are given, and results of measurements of intensities of spectrum lines and afterglow effects are considered. The sensitivity of photodiodes and transistors to IR region indicates the limitation when wide spectra are to be analysed. (2 refs.) *I.G.*

07.65E UV and visible spectroscopy and spectrometers

64963 Electret microphone for use in photoacoustic spectrometer and photoacoustic spectrum of some rare earth oxide powders. V.N.Rai, L.B.Tiwari, S.N.Thakur, D.K.Rai (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Pramana (India), vol.19, no.6, p.579-92 (Dec. 1982). [received: April 1983]
Describes a new method for the polarisation of an electret foil which has proved very convenient and yields a foil having very good performance in a microphone. The variations in the charge accumulation on the electret foil and its decay with time as well as the variation of the microphone sensitivity with different microphone parameters has been investigated. The sensitivity of the home-made microphone is estimated as 1 mV/μbar. The working of this type of microphone and its comparison with a commercial microphone as used in a single beam photoacoustic spectrometer is discussed. A brief description of the photoacoustic spectrometer including microphone biasing and the photoacoustic cell is given. The photoacoustic spectra of some rare earth oxides in the form of powders have been recorded. It is seen that the atomic levels of triplyionised rare earths which are not fluorescent appear very prominently in the photoacoustic spectrum. The spectra for terbium and praseodymium oxides do not show clear peaks probably due to the presence of different stoichiometric forms. (21 refs.)

Long path length samples in thermal lens calorimetry .... See Entry 64905

07.65G IR spectroscopy and spectrometers

64964 Wavenumber calibration of Fourier transform spectra. R.L.Hawkins, M.L.Hoke, J.H.Shaw (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
Appl. Spectrosc. (USA), vol.37, no.2, p.134-9 (March-April 1983).
Spectra with a resolution of about 0.06 cm^{-1} obtained by a Fourier transform spectrometer have been calibrated by the internal standard method. An accuracy of 3×10^{-3} cm^{-1} over intervals of several thousand wavenumbers has been obtained by measuring the lines with a precision of 2×10^{-3} cm^{-1} and by using a large number of standard lines. (19 refs.)

64965 Width-enhanced binary representation for library searching of vapor phase infrared spectra. F.V.Warren,Jr., M.F.Delaney (Dept. of Chem., Boston Univ., Boston, MA, USA).
Appl. Spectrosc. (USA), vol.37, no.2, p.172-81 (March-April 1983).
A method is presented for the representation of vapor phase infrared spectra in a binary format which preserves both width and position information about each peak. Preselection of an optimally width-enhanced library of binary spectra, in advance of any actual library searching, is approached through the application of information theory and Grotch's method for prediction of matching histograms. A direct comparison of library searching results is conducted to complement the preselection efforts. The applicability of a channel-combination approach based on information theory is demonstrated. (28 refs.)

64966 Inverse Lamb dip spectroscopy using microwave modulation sidebands of CO_2 laser lines. G.Magerl, J.M.Frye, W.A.Kreiner, T.Oka (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.656-8 (15 April 1983).
The authors report the observation of infrared Lamb dips using a widely tunable laser source. The microwave sidebands generated on CO_2 laser lines provide sufficient power ($\sim$0.5 mW) and spectral purity ($\Delta\nu\lesssim100$ kHz) for saturation spectroscopy. Application of this infrared source to the observation of infrared Lamb dip spectra of CH_3F and SiF_4 is reported. (18 refs.)

64967 Infrared investigations with high sensitivity spectrometers: aspects of modern research. K.Narahari Rao (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.659-66 (Nov. 1982). [received: April 1983]
The author discusses the modern aspects of infrared investigations with high sensitivity spectrometers. Experiments with solid hydrogen are reviewed. (5 refs.)

Quantitative determination of catalytic surface adsorption sites by Fourier transform infrared photoacoustic spectroscopy .... See Entry 68815

Fourier transform infrared evolved gas analysis (FT-IR-EGA) .... See Entry 68816

07.68 PHOTOGRAPHY, PHOTOGRAPHIC INSTRUMENTS AND TECHNIQUES

(for light sensitive materials see also 42.70)

64968 Canon T50. A report. G.Crawley.
Br. J. Photogr. (GB), vol.130, no.11, p.289-91 (18 March 1983).
Describes the Canon T50, a fully automatic programmed exposure control, 35 mm SLR with built in motor winder. The camera is not aimed at the professional market but is an attempt to bridge the gap between the all-in package and sophisticated SLR camera, offering many of the attractions of the former combined with the greater versatility inherent in a 35 mm SLR with interchangeable lenses. Following a brief outline of the main features, i.e. size, weight, shape, finish and top plate layout, the author gives operational details for the exposure control, electrical components, viewfinder, shutter, film advance and flash. (no refs.)

64969 Photography using semiconductors.
Funk-Tech. (Germany), vol.38, no.3, p.110-12 (March 1983). In German.
The essential components of semiconductor image converters, such as charge coupled devices, are discussed. The architecture of such CCDs for photographic cameras is described, e.g. frame transfer arrays, interline transfer arrays and charge injection devices. (no refs.) *A.E.W.*

64970 Highlights from 'Photokina'. G.Tollmein.
Funk-Tech. (Germany), vol.38, no.3, p.116-17 (March 1983). In German.
The latest developments in photographic technology as shown at 'Photokina' in Cologne are discussed, and in particular the growing convergence of TV, video and radio technologies. A range of microimage cameras from Kodak, Minolta and Rollei are reviewed. (no refs.) *A.E.W.*

64971 Light barrier as photo-trap: with the camera on safari. K.Hantke.
Funkschau (Germany), no.6, p.84-8 (18 March 1983). In German.
The construction and use of an ingenious high-performance flash unit as an aid in the photography of shy nocturnal animals are described in detail, supported by the complete circuit diagram, pulse waveforms, components list and drawings of the two printed boards with layout instructions. The system contains an infrared sender pulsed at a 10 kHz rate, and a receiver with a BP 104 light diode as input sensor, made particularly efficient by the fitting of a beam finder, an object-recognizing electronic 'window' equivalent to approximately 40 μs and a complex chain of trigger pulses to initiate the shutter and optionally up to three electronic flashes at selected time intervals. 9 ICs are used, plus a number of discrete diodes, transistors and thyristors. Mains or battery supply is possible. (no refs.) *A.L.*

64972 Physical behaviour of a magnetic one-component developer. M.Schleusener, R.Mugai (VEB Mikroelektron., Berlin, Germany), M.Lammerzahl, E.Ellinger, H.-W.Stottmeister, H.Fiedler.
J. Signalaufzeichnungsmater. (Germany), vol.11, no.1, p.47-54 (1983). In German.
The electric and magnetic properties of two different one component magnetic developers are measured and their deposition behaviour is investigated quantitatively. The experimental results, relating to the toner parameters and toner deposition are discussed on the basis of physical principles of the deposition mechanism. (8 refs.)

64973 Model of one-component magnetic brush development. E.Schnell (Sektion Math. & Phys., TH Otto von Guericke Magdeburg, Magdeburg, Germany).
J. Signalaufzeichnungsmater. (Germany), vol.11, no.1, p.55-68 (1983). In German.
A simple model for the description of dynamic current curves and development kinetics of a single component magnetic toner is presented. The toner material consist of a high resistance body with admixtures of ferromagnetic material. On the surface conducting islands are distributed. A critical comparison of the calculated and measured deposition curves is given. (12 refs.)

64974 The use of photographic space in the development of the disc photographic system. T.M.Rice, T.W.Faulkner (Eastman Kodak Co., Kodak Apparatus Div., Rochester, NY, USA).
J. Appl. Photogr. Eng. (USA), vol.9, no.2, p.52-76 (April 1983).
The concept of photographic space has been developed as a means to describe the light level and distance conditions under which amateur photographs are taken. Data have been collected to quantify the frequency of occurrence of picture-taking as a function of both light level and distance. To make use of this photographic space data, a pair of equations has been derived from basic photographic principles to describe the capability of any photographic system to cover photographic space, and to show how the prameters of a photographic system affect resultant coverage. The development of these equations is described, and their application to the definition of the disc photographic system is presented. Some of the supporting studies necessary to refine and optimize the disc system definition are also discussed. (8 refs.)

64975 The influence of film, paper, and printer spectral characteristics on photofinishing performance. W.C.Kress, P.J.Alessi (Eastman Kodak Co. Res. Labs., Rochester, NY, USA).
J. Appl. Photogr. Eng. (USA), vol.9, no.2, p.58-62 (April 1983).
Because of the diversity of products which the photofinisher may want to use, the interrelationships among the spectral properties of film, print material, and printer monitors are important. If films having spectral differences but obeying the silver criterion are to be printed using the same photofinishing printer setup, ideally the printer monitor response should be the same as the print material spectral sensitivities. An exact match between monitor and print material characteristics is both unnecessary and difficult to obtain; an approximation would be suitable. A modeling procedure is described which eliminates sensitometric differences between film samples and generates on-aim spectrometric characteristics. From these data, different printer monitor responses can easily be evaluated and compromises appraised. (3 refs.)

64976 A colorimetric determination of residual thiosulfate (hypo) in processed paper. D.Owerbach (Eastman Kodak Co., Photographic Technol. Div., Rochester, NY, USA).
J. Appl. Photogr. Eng. (USA), vol.9, no.2, p.66-70 (April 1983).
The existing ANSI standard for determining residual thiosulfate (hypo) in processed films and papers is not valid for certain kinds of photographic papers. The AnSI standard consists of two methods, the methylene blue method and the densitometric method. A colorimetric method for determining residual hypo in films, published in 1966, proved effective for paper samples that could not be measured by the methylene blue method. The colorimetric method consists of eluting thiosulfate from a paper sample, and then adding the eluent to an iodine-amylose solution. The loss of iodine-amylose color is a measure of the residual thiosulfate removed from the paper into the eluent. (6 refs.)

64977 A simple method of evaluating the polychromatic modulation transfer function for photographic systems. S.Vallmitjana (Dept. de Optica, Univ. de Barcelona, Barcelona, Spain), D.Navajas, J.J.Barandalla, J.R.de F. Moneo.
J. Opt. (France), vol.14, no.1, p.25-8 (Jan.-Feb. 1983).
A rapid method of the measurement of the polychromatic optical transfer function (POTF) of a total system-optics plus reversal colour film is described, based on the scanning and Fourier analysis of the photographic image of a slit. This scanning is carried out through a microdensitometer with a spectral response that has been adapted to be analogous to the human eye in photopic vision. The results of the curves calculated in different positions of the image plane by this method are compared with the curves calculated according to the integral extended to various monochromatic wavelengths. The values of the PMTF calculated by the proposed method are on average lower over the whole range of frequencies than those calculated by several wavelengths. In order to analyse the implications of these differences in image quality the authors have applied a numerical criterion of image quality to both methods, based on the area of the PMTF. The results indicate a strong statistical dependence between the two methods. (10 refs.)

64978 Adapting microscopes for instant photomicrography.
Lab. Equip. Dig. (GB), vol.21, no.4, p.92-3 (April 1983).
Many conventional photomiocrographic systems require technical expertise to calculate exposure and some waiting time to see the results. In contrst, photography is easy to use and gives immediate feedback. Polaroid instant films in 'peel-apart' form have been used for many years to make high-quality photomicrographs in a matter of minutes. The development of the SX-70 system opened new horizons for many types of photography, including photomicrography. If this system could be adapted to a microscope, a technician with little training in photography could turn out excellent instant micrographs without concern for exposure or development. (no refs.)

64979 Laboratory photographic equipment in focus.
Lab. Equip. Dig. (GB), vol.21, no.4, p.97-9 (April 1983).
Microprocessors are now coming to the aid of the laboratory photographer and photomicrographer. Fully automatic exposure control is just one of the recent advances featured in this review of photographic equipment. (no refs.)

64980 General Gaussian theory of mechanically compensated zoom lenses. III. Critical point and singular point of the zoom equation. K.Tanaka (Canon Res. Center, Canon Inc., Tokyo, Japan).
Opt. Commun. (Netherlands), vol.45, no.4, p.231-4 (15 April 1983). In German.
For pt.II see ibid., vol.43, no.5, p.315 (1982). An analysis is made on the critical point and singular point of the zoom equation, which governs the component movement of an *n*-component mechanically compensated zoom lens. In the neighbourhood of the special points, the zoom equation is approximately expressed by the quadratic form. A numerical example is also added. (12 refs.)

64981 Anisotropy induced in a silver chloride emulsion by two successive beams of white light perpendicularly polarized. M.Attia, S.Debrus, M.P.Henriot, M.May (Inst. d'Optique, Univ. Pierre et Marie Curie, Paris, France).
Opt. Commun. (Netherlands), vol.45, no.4, p.235-40 (15 April 1983).
Studies of the anisotropy induced in a silver chloride photographic emulsion by two successive beams of white light, linearly polarized at right angle. After the first exposure, the colloidal medium contains silver ellipsoids e generated by the photolysis of silver chloride and silver e_b resulting of the partial destruction of some of the previous ones by long wavelengths. This medium is then illuminated by the second beam linearly polarized at right angle of the first beam. Short wavelengths induce silver ellipsoids e′ identical to the ellipsoids e but rotated through $\pi/2$ with respect to them. As in the first exposure, some of them are partly broken up and transformed into ellipsoids e'_b identical to ellipsoids e_b but the direction of their major axis. Moreover, the long wavelengths of second exposure transform some of the particles e and e_b generated during the first exposure, into smaller ellipsoids e_{eb} and e_{bb}. Finally, the colloidal medium resulting from these two exposures, contains silver chloride and six types of silver particle. By calculating the indices of the medium, the authors show that the wavelengths characterizing the zero birefringence and zero dichroism of the emulsion are dependent of the energies recorded during each of the exposures. (17 refs.)

64982 Landsat multitemporal color composites. J.R.Eyton (Dept. of Geography, Pennsylvania State Univ., University Park, PA, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.2, p.231-5 (Feb. 1983).
Landsat MSS and RBV images can be photographically color composited using scenes of the same spectral band obtained at three different dates. The resulting composite exhibits temporal information only, with areas of change displayed as various hues and areas of no change displayed as black and white tones. Images from three different years and images acquired at three different periods within the same year were used to construct several examples of a multitemporal color composite. This technique is particularly useful when applied to the single band, high resolution Landsat-3 RBV scenes. (3 refs.)

64983 Correcting the residual astigmatism of complicated photographic systems. V.V.Tarabukin.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.494-6 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.23-5 (Aug. 1982). [received: April 1983]
The possibilities of correcting the residual astigmatism in wide-angle and simultaneously large-aperture photographic systems are examined. A method is suggested for system correction by means of the parameters considered. (2 refs.)

64984 Effects of speckle recording on the diffraction halo in speckle photographs. L.Marti Lopez (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1367-9 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2224-8 (Nov. 1982). [received: May 1983]
The effects of the recording process on the diffraction halo in speckle photographs is considered. It is shown that the diameter of the diffraction halo, and hence the smallest measurable transverse displacement, depends on the characteristic curve, diffraction efficiency, and noise level in the photographic material. (5 refs.)

64985 Potentials of the continuous optical film printing method. N.D.Bernstein.
Tekh. Kino & Telev. (USSR), no.4, p.7-13 (April 1983). In Russian.
The author analyses the potentialities of the continuous optical printing method (COP) in film production and release printing processes. Some technical characteristics of the COP method are discussed. He considers a number of problems in cinematography development which may be solved using this method: film format conversions, search and introduction of new efficient methods of film production and release printing, unification of film printing equipment use of old film materials, etc. (12 refs.)

64986 The Kinor 35R II film camera. E.G.Bychko, L.Z.Kaplan, L.I.Ofitserov, S.A.Solomatin, S.I.Rudman.
Tekh. Kino & Telev. (USSR), no.4, p.14-15 (April 1983). In Russian.
Considers the design features of the Kinor 35R II film camera, which is an improved version of the Kinor 35R camera. (1 ref.)

64987 Methods for quality control of final film washing. G.V.Velichko, L.I.Veronovskii, I.I.Friedman, G.T.Khaitsova.
Tekh. Kino & Telev. (USSR), no.4, p.16-19 (April 1983). In Russian.
Considers three methods for determining the residual thiosulphate content in films. The most accurate and sensitive 'methylene blue' method permits finding thiosulphate in quantities as low as 0.00015 mg/cm^2. For rapid control a chemical-densitometric method is presented. (7 refs.)

64988 What should be film equipment for motion picture network?. V.B.Mun'kin.
Tekh. Kino & Telev. (USSR), no.4, p.19-24 (April 1983). In Russian.
The author considers the principles of determining a rational set of a film projection complexes according to the requirements of high quality film presentation, equipment reliability and operation conditions. (no refs.)

64989 On the problem of silver in photography. Yu.I.Zhurba, L.I.Mazina.
Tekh. Kino & Telev. (USSR), no.4, p.54-60 (April 1983). In Russian.
The problems of silver in photography are considered. Data on worldwide silver production and consumption, silver circulation in production and use of motion picture and photographic film materials are given. Methods of silver recovery from processing solutions and washing waters are described and their pros and cons are revealed. (26 refs.)

64990 A rational system for motion picture theatre operation control. V.I.Ushagina.
Tekh. Kino & Telev. (USSR), no.4, p.60-1 (April 1983). In Russian.
An automatic system for controlling a number of motion picture theatres developed and used in West Germany is described. (3 refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

64991 A test apparatus for secondary ion mass spectrometry. N.Klaus (Inst. fur Experimentalphys., Univ. Wien, Wien, Austria), J.D.Brown.
Can. J. Phys. (Canada), vol.61, no.4, p.535-42 (April 1983).
A low cost test device for secondary ion mass spectrometry (SIMS) components is described. It consists of a turbomolecular pumped vessel containing an insulated sample stage on an *x-y* manipulator, extraction optics, quadrupole mass filter, and channel electron multiplier. The construction and characteristics of a cylindrical and a spherical saddlefield ion source are described. The output of the cylindrical source is 10^{-4} A cm^{-2} whereas that of the spherical source is in the order of 10^{-3} A cm^{-2} at voltages up to 9 kV and at a beam divergence of 4°. (7 refs.)

64992 Improvement of a pulse generator for the Atom-probe: doubling of pulse-voltage. E.Nomura, S.Horie, O.Nishikawa (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L162-4 (March 1983).
In order to increase a pulse voltage, a stack of two mercury-wetted reed relays was employed as a switch for a voltage-pulse generator. The stacked relays doubled the attainable pulse voltage owing to an increase of breakdown voltage of the switch In the mass analysis of W with a high mass-resolution time-of-flight atom probe incorporating the new pulse generator, no deterioration of mass resolution is seen over a wide range of the pulse amplitude, verrifying the usefulness of the generator especially in the case where a high pulse voltage is required.

64993 Generation of t^{-2} voltage pulses for ion analysers. R.M.Clement, H.T.Miles (Dept. of Phys., Univ. Coll. of Swansea, Swansea, Wales).
J. Phys. E (GB), vol.16, no.5, p.377-81 (May 1983).
An electronic system is described for the generation of the t^{-2} voltage pulse used for ion separation in a particular form of time-of-flight ion energy analyser. The pulse is synthesised with an *RC*-network and the theory for the design of this special network is given in detail. A technique for making measurements on the pulse waveform is included and such measurements

show that the t^{-2} pulse produced experimentally had an accuracy of better than 3% over a voltage dynamic range of greater than 30 dB. Other applications of the work, which could involve voltage pulses different from the t^{-2} shape considered in detail, are suggested and the possibility of generating specially shaped pulses at a high voltage level is discussed. (6 refs.)

07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS

(see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)

64994 Stable atomic hydrogen possible application in intense polarized sources. T.Q.Niinikowski, S.Penttila, J.-M.Rieubland (CERN, Geneva, Switzerland).
AIP Conf. Proc. (USA), no.95, p.597-600 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors briefly review the status of spin-polarized atomic hydrogen and discuss a possible way of extending the present limit of density. Pulse extraction of stabilized atoms by millimetre wave is proposed as a means of producing polarized atomic beams of uniform velocity and low divergence. It is speculated that these atoms could be used either as jet targets of a conventional type, or as a stored atomic beam target by injecting them into a storage ring intersecting with an accelerator beam. When used in a polarized ion source, the high density of the atomic beam could possibly also improve the ionizer efficiency. (12 refs.)

64995 Atomic hydrogen source with direct helium cooling. T.O.Niinikoski, S.Penttila, J.-M.Rieubland (CERN, Geneva, Switzerland).
AIP Conf. Proc. (USA), no.95, p.601-3 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors have constructed a helium-cooled atomic source where the discharge tube is placed immediately above the helium bath. The advantages of our system are simplicity, very short length and therefore small losses of the atomic beam, and the possibility of cryopumping molecular hydrogen. Preliminary tests show the feasibility of these principles. Further work is aimed at geometrical and thermal improvements, and possibly the addition of a spin selection magnet near the cooling tube. (6 refs.)

64996 Proton polarimeters at high energy. K.Kuroda (LAPP, Annecy-le-Vieux, France).
AIP Conf. Proc. (USA), no.95, p.618-33 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
With the advent of multihundred GeV polarized proton beams the problem of calibrating beam polarization becomes primordial. Among various possible designs, those based on electromagnetic interactions are revealed quite promising. In particular, polarimeter using the Coulomb diffractive dissociation of proton on heavy nuclei would provide the best solution by reason of the high analyzing power and cross section. A more classical solution based on pp elastic scattering in the Coulomb-Nuclear interference region is also considered as a dependable method, not only for fixed target experiments, but also for the calibration of accelerating polarized protons. (30 refs.)

64997 Electromagnetic interference in high energy polarization. N.H.Buttimore (Trinity Coll., Dublin, Ireland).
AIP Conf. Proc. (USA), no.95, p.634-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The polarization of high energy protons may be determined from an asymmetry measurement in the hadron-electromagnetic interference region of proton-proton elastic scattering. The author examines a contribution to the expected 5% asymmetry from the single helicity-flip hadronic amplitude. An expression of polarization and spin rotation parameters allows the size and error of this contribution to be estimated over a range of momenta from 3.8 to 45 Gev/c. Indications are that the asymmetry approaches the expected asymptotic value with weak energy dependence $\simeq 1/\sqrt{\sigma}(\mathrm{tot})$. Nuclear targets display somewhat lower asymmetries than those of the proton, but they are comparable. (13 refs.)

64998 Carbon grid ion source. J.J.Cuomo, J.M.E.Harper, A.Kleinsasser (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.25, no.10, p.5070-1 (March 1983).
Describes how carbon ion extraction grids, used with controlled ion bombardment of the grids, sputter carbon onto the sample and can introduce a controllable amount of carbon into an oxide layer. (no refs.)

07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

65000 Static-wavelength independent radiation attenuator. P.L.Csonka (Inst. of Theoretical Sci., Univ. of Oregon, Eugene, OR, USA).
Appl. Opt. (USA), vol.22, no.8, p.1149-59 (15 April 1983).
The static radiation attenuator consists of one or several layers of absorbing material into which randomly distributed holes are drilled. The attenuator needs no moving parts and reduces not only the time averaged but also the instantaneous brightness, and reduction by an arbitrarily large factor can be easily achieved. The transmitted intensity fluctuates randomly as a function of spatial position, but the expected fluctuation can be evaluated and can be made arbitrarily small. Various properties of the device are explored. (7 refs.)

65001 Uniform and graded multilayers as X-ray optical elements. Ping Lee (Ball Aerospace Systems Div., Boulder, CO, USA).
Appl. Opt. (USA), vol.22, no.8, p.1241-6 (15 April 1983).
A detailed comparison of the performance of uniform and graded multilayers as soft X-ray monochromators and normal incidence collectors has been made. In particular, the responses of flat depth-, and laterally graded multilayers to Al K_α radiation, $\lambda = 8.34$ Å, have been computed and compared with the corresponding uniform multilayer. Furthermore, the efficiency of graded and uniform multilayers as normal incidence X-ray collectors has been calculated in terms of effective areas for parabolic reflectors tuned to the OK_α line, $\lambda = 23.7$ Å. Finally, the effective areas of four strong solar emission lines in the 30-60 Å region have been computed for uniform multilayers. Normal incidence multilayer mirrors are well suited for spectroheliograph type of applications. (12 refs.)

65002 A simple method for measuring the noise of amplifying foils. M.Wolf, A.M.Gurvic (Forschungsinst. fur Lungenkrankheiten & Tuberkulose, Berlin, Germany), M.A.Il'ina.
J. Signalaufzeichnungsmater. (Germany), vol.11, no.1, p.31-9 (1983). In German.
A simplified method for the measurement of screen noise (quantum+structured noise) in radiographic film-screen-systems is described, that in principle can be applied to all systems, where blurred noise is photographically recorded. The method is based on one developed by Volke (1978, 1979) where the variance of density values is determined, that are measured with diaphragms of different size (microphotometer) from a uniformly exposed field. The method was extended to quadratic diaphragms and a measurement scheme was developed that reduces the number of measurements without intolerable reduction of accuracy. The number of calculations necessary is reduced by a number of diagrams. (7 refs.)

65003 Exposure-time determination in radiography. I.V.Borovin (Uralkhimmash Production Organization, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.657-60 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.85-8 (Aug. 1982). [received: April 1983]
A method is considered for determining the absorption coefficient (total interaction cross section) for a broad γ-ray beam. It is desirable to use an X-ray film as the detector in such radiographic measurements. (6 refs.)

11.10 FIELD THEORY

65004 The 't Hooft-Polyakov monopole near the Prasad-Sommerfield limit. C.L.Gardner (Center for Theoretical Phys., MIT, Cambridge, MA, USA).
Ann. Phys. (USA), vol.146, no.1, p.129-48 (March 1983).
A perturbative classical monopole solution for the $SO(3)$ gauge theory is constructed in the limit of small but nonvanishing Higgs potential. This corresponds to the limit $\mu^2/2M_W{}^2=\lambda\ll 1$, where μ equals the mass of the scalar particle and M_W equals the mass of the intermediate vector particles. The monopole solution and mass are found to involve nonanalytic functions of λ: $\sqrt{\lambda}$ and $\lambda \ln \lambda$. (11 refs.)

65005 Rites of spin. D.Sivers (High Energy Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
AIP Conf. Proc. (USA), no.95, p.13-27 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Some simple examples which deal with spin degrees of freedom in gauge theories are examined for clues concerning the role of spin in formulating new theoretical ideas. (26 refs.)

65006 Renormalization scheme dependency and decoupling in the mass independent renormalization scheme. G.McKeon (Dept. of Appl. Math., Univ. of Western Ontario, London, Ontario, Canada).
Can. J. Phys. (Canada), vol.61, no.4, p.564-70 (April 1983).
The problem of renormalization scheme dependency that occurs when one employs mass independent renormalization is examined. In order to render this renormalization scheme viable in practical calculations, a way of decoupling heavy fields by demanding that the Appelquist-Carazzone theorem be satisfied at the outset is devised. (20 refs.)

65007 Gauge potentials and bundles over the 4-torus. C.Nash (Dept. of Math. Phys., St. Patrick's Coll., Maynooth, Ireland).
Commun. Math. Phys. (Germany), vol.88, no.3, p.319-25 (March 1983).
The construction of principle bundles over a four-dimensional torus is considered. The class of groups considered is $SU(n)/Z_n$, and for this class the Pontrjagin class has even integer values. (6 refs.)

65008 Local aspects of superselection rules. II. S.Doplicher, R.Longo (Istituto Matematico G. Castelnuovo, Univ. di Roma, Roma, Italy).
Commun. Math. Phys. (Germany), vol.88, no.3, p.399-409 (March 1983).
For pt.I see ibid., vol.85, p.73 (1982). In a theory where the local observables are determined by local field algebras as the fixed points under a (a priori noncommutative) group of gauge transformations of the first kind, the authors show that, if the field algebras possess intermediate type I factors, they can construct observables having the meaning of local charge measurements, and local current algebras in the field algebras. (18 refs.)

65009 $(\mathrm{Higgs})_{2,3}$ quantum fields in a finite volume. III. Renormalization. T.Balaban (Dept. of Phys., Harvard Univ., Cambridge, MA, USA).
Commun. Math. Phys. (Germany), vol.88, no.3, p.411-45 (March 1983).
For pt.II see ibid., vol.86, p.555-94 (1982). This contains a proof of the bounds on the effective actions needed in the two previous papers. The proof is based on perturbative analysis of renormalization. (3 refs.)

65010 On GL(4,R)-covariant extensions of the Dirac equation. J.Mickelsson (Mittag-Leffler Inst., Djursholm, Sweden).
Commun. Math. Phys. (Germany), vol.88, no.4, p.551-67 (1983).
Infinite component generalizations of both massless and massive Dirac equations are constructed which are covariant with respect to the double covering of the general linear group in four dimensions. These generalized Dirac equations can be made covariant with respect to the full diffeomorphism group of the spacetime manifold by replacing ordinary derivatives by covariant derivatives in the usual way. (8 refs.)

65011 On the massive sine-Gordon equation in the higher regions of collapse. F.Nicolo (Istituto di Matematica, Univ. di Roma, Roma, Italy).
Commun. Math. Phys. (Germany), vol.88, no.4, p.581-600 (1983).
Proves that the renormalization program discussed by Benfatto et al. (1982) can also be developed beyond the $\bar{\alpha}^2=2\pi(\sqrt{17}-1)$ threshold. This result also allows a simplification in the technical part of the proof of ultraviolet stability in the $\phi_3{}^4$-theory. The author discusses, heuristically, but in some detail the interpretation of the sine-Gordon theory as a two-dimensional Yukawa gas for $\beta e^2=\alpha^2>4\pi$. (4 refs.)

65012 Efficient implementation of the Monte Carlo method for lattice gauge theory calculations on the floating point systems FPS-164. K.J.M.Moriarty (Dept. of Math., Royal Holloway Coll., Englefield Green, England), J.E.Blackshaw.
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.155-61 (April 1983).
The computer program calculates the average action per plaquette for $SU(6)/Z_6$ lattice gauge theory. By considering quantum field theory on a space-time lattice, the ultraviolet divergences of the theory are regulated through the finite lattice spacing. The continuum theory results can be obtained by a renormalization group procedure. (13 refs.)

65013 On the single point field theories. G.Parisi (Tor Vergata Univ. Roma, Roma, Italy), Zhang Yi-Cheng.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.408-20 (2 May 1983).
A systematic approach to reduce the dynamical degrees of freedom is presented. Certain field theory models with non-trivial large-N limit defined in the infinite volume are shown to be reduced to theories defined at a single point in space-time when $N\to\infty$. (17 refs.)

65014 Decay of the false vacuum at finite temperature. A.D.Linde (Lebedev Phys. Inst., Moscow, USSR).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.421-45 (2 May 1983).
Studies kinetics of the first-order phase transitions in gauge theories with spontaneous symmetry breaking. A general theory of the decay of the metastable phase (false vacuum) at a finite temperature is developed. A number of concrete examples are considered, which will make it possible to study kinetics of phase transitions in a wide class of theories without complicated computer calculations. (41 refs.)

65015 A lagrangian formulation of the Wess approach to supersymmetric Yang-Mills theories. P.A.Marchetti (Scuola Internazionale Superiore di Studi Avanzati, Trieste, Italy), P.Pasti, M.Tonin.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.446-58 (2 May 1983).
The authors obtain a superspace lagrangian density which reproduces the Wess formulation of sypersymmetric gauge theories. The present approach, which is a first-order formalism, gives rise to a lagrangian density polynomial in the Yang-Mills and auxiliary superfields and appears to be stable under quantization and renormalization. (16 refs.)

65016 The quantum mechanical supersymmetric O(3) and O(2,1) σ-models. A.C.Davis, A.J.MacFarlane, J.W.van Holten (CERN, Geneva, Switzerland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.493-507 (2 May 1983).
The authors study and solve the reductions to $(0+1)$ space-time dimensions of the O(2,1) and O(3) supersymmetric δ-models. By explicitly solving their Schrodinger equation they have calculated the spectra for the models. Results show that supersymmetry is not broken in these field theories. Another interesting result is that in the non-compact model the inclusion of fermions gives rise to the appearance of an infinite multiplet of discrete zero-energy states, which are absent in the purely bosonic model. This implies that the O(2,1) symmetry is spontaneously broken. (14 refs.)

65017 Renormalization-group analysis of supersymmetric mass hierarchies. H.Yamagishi (Dept. of Phys., Princeton Univ., Princeton, NJ, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.508-46 (2 May 1983).
A renormalization-group analysis is performed for supersymmetric models of the O'Raifeartaigh (1965) type coupled to a Yang-Mills supermultiplet. For an appropriate range of coupling constants, the author finds that large mass ratios can be naturally generated by one-loop corrections to the effective potential. The results confirm Witten's (1981) recent observation that these models provide a potential solution to the gauge hierarchy problem. The general renormalization-group analysis of symmetry breaking developed in this paper is applicable in contexts other than supersymmetry. They also give a simple argument that the canonical form of the supersymmetric Ward identities can be maintained in the presence of quantum effects. (77 refs.)

65018 Principal orbits and the Yang-Mills-Higgs model. P.Houston (CERN, Geneva, Switzerland).
J. Phys. A (GB), vol.16, no.6, p.1117-24 (21 April 1983).
The author gives a strong necessary condition for the principal stabiliser of the action of a compact Lie group to have a non-zero centre. An application to the monopole problem in Yang-Mills-Higgs models is discussed. (12 refs.)

65019 The ground-state solutions of the conformally covariant spin-2 wave equation. J.Fang (Dept. of Phys., California State Polytech. Univ., Pomona, CA, USA), W.Heidenreich, B.W.Xu.
J. Phys. A (GB), vol.16, no.7, p.L225-8 (11 May 1983).
The most general ground-state solutions of the second-order conformally covariant spin-2 wave equations are obtained. The spin-2 field is represented by the symmetric rank-two tensor of the conformal group. The authors find that none of the ground-state solutions belong to a unitary irreducible representation of the conformal group. (3 refs.)

65020 The monopole's spinor fields. G.A.Ringwood.
J. Phys. A (GB), vol.16, no.7, p.L235-7 (11 May 1983).
It is shown that the Wu-Yang monopole is described, completely geometrically, by the Kustaanheimo-Stiefel (1965) bundle. Sections of the tangent space to the bundle are spinor fields, showing that this monopole is an intrinsically spin one half particle. (6 refs.)

65021 Gauge differential form theories on the lattice. C.Omero (Istituto di Fisica Teorica, Univ. di Trieste, Trieste, Italy), P.A.Marchetti, A.Maritan.
J. Phys. A (GB), vol.16, no.7, p.1465-74 (11 May 1983).
Discusses gauge differential form theories on the lattice which have Kalb-Ramond (1974) theories of interacting r and $r-1$ forms as naive continuum limit; the Higgs character of the $r-1$ form is clearly displayed. The authors derive some inequalities useful for drawing tentative phase diagrams and analyse the existence of θ-vacua. (28 refs.)

65022 Equivalent Lagrangians in field theory. J.R.Farias, N.L.Teixeira (Dept. de Fisica, Univ. Federal de Paraiba, Paraiba, Brazil).
J. Phys. A (GB), vol.16, no.7, p.1517-21 (11 May 1983).
A theorem by Hojman and Harleston (1981) for multidimensional equivalent Lagrangians (L and $\bar{L}$) in the realm of Newtonian mechanics is generalised to field theory. Equivalent Lagrangians for some set of field equations are found. (5 refs.)

65023 Orbit space and minima of Landau-Higgs potentials. M.V.Jaric (Inst. des Hautes Etudes Sci., Bures-sur-Yvette, France).
J. Math. Phys. (USA), vol.24, no.4, p.917-21 (April 1983).
The author establishes a connection between recent propositions for minimization of Higgs potentials in an orbit space and related treatments in the Landau theory of phase transitions. Starting from isotropy groups he gives a simple and systematic procedure for determining a stratification in an orbit space. As an illustration he treats the point groups O_h and T_d which occur in the Higgs mechanism for SO_7 and SU_4 adjoint representations. (17 refs.)

65024 On the two-point functions of some integrable relativistic quantum field theories. S.N.M.Ruijsenaars (Dept. of Math., Texas A&M Univ., College Station, TX, USA).
J. Math. Phys. (USA), vol.24, no.4, p.922-31 (April 1983).
Two-point functions associated with the Federbush, massless Thirring, and continuum Ising models and their boson analogs are studied. In the Thirring case it is shown that the fields do not define operator-valued distributions, while temperedness of the two-point Wightman function is proved in the Ising case and in the Federbush case for a certain range of coupling constants. By relating the short-distance singularity of the Schwinger functions to the high-energy behavior of the spectral measures it is shown the fields cannot be made to satisfy the CCR/CAR by a rescaling. In the fermionic Federbush case this breakdown of the CAR occurs in spite of the fact that the fields correspond to a local Lagrangian. (9 refs.)

65025 Particle states and scattering theory in abelian gauge model with spontaneously broken symmetry. G.Bishop (Dept. of Phys., Univ. of Rhode Island, Kingston, RI, USA), K.Haller.
J. Math. Phys. (USA), vol.24, no.4, p.932-48 (April 1983).
This is an exposition of the electrodynamics of the ϕ^4 theory with a spontaneously broken U(1) symmetry. The Lagrangian in a manifestly covariant gauge is used to construct the Hamiltonian and canonical commutation rules. Part of the Hamiltonian is a 'free-field' Hamiltonian which describes noninteracting massive spin-1 Proca bosons, Higgs bosons, and ghosts. The remainder of the Hamiltonian is a perturbation for which an interaction picture is developed and Feynman rules are systematically derived by the Dyson-Wick procedure. The choice of the 'free-field' Hamiltonian is based on earlier work, in which the particle spectrum was identified and verified explicitly by implementing Lorentz boosts on particle states. It is shown that application of the subsidiary condition and inclusion of interactions in evaluating positive frequency parts of gauge fixing fields is not only essential for consistency, but in this case also of practical importance in the proper identification of the Proca bosons. (18 refs.)

65026 Yang-Mills theory in null-path space. S.L.Kent (Dept. of Math. & Statistics, Univ. of Pittsburgh, Pittsburgh, PA, USA), E.T.Newman.
J. Math. Phys. (USA), vol.24, no.4, p.949-59 (April 1983).
The authors define a GL(n,C) matrix-valued function G on a six-dimensional space of null paths in Minkowski space. Such paths are defined to begin at an arbitrary spacetime point x^a and end at future null infinity. The space of these paths can thus be parametrized by giving the point x^a and null direction. They show how knowledge of G can be used to obtain the GL(n,C) Yang-Mills connection at x^a. They also derive a single equation for G, involving characteristic data given on null infinity, which is equivalent to the currentless or vacuum Yang-Mills field equations. The self-dual (anti-self-dual) nonabelian fields and the general abelian cases are described as special examples. (14 refs.)

65027 On the generalization of the 't Hooft field strength in the Yang-Mills-Higgs model. P.Houston (Inst. Hautes Etudes Sci., Bures-sur-Yvette, France).
J. Math. Phys. (USA), vol.24, no.4, p.960-8 (April 1983).
The generalization to the gauge groups SU(n) and SO(n) of the 't Hooft electromagnetic field is considered for finite energy configurations of the Yang-Mills-Higgs model, and it is shown how this results in the association of sets of integer changes with any closed surface. Differential inequalities satisfied by the Higgs invariants are presented, and their implications are discussed. (13 refs.)

65028 A particle representation for Korteweg-de Vries solitons. G.Bowtell, A.E.G.Stuart (Dept. of Math., City Univ., London, England).
J. Math. Phys. (USA), vol.24, no.4, p.969-81 (April 1983).
In an earlier paper (1977) the authors established an equivalence between the dynamics of interacting sine-Gordon solitons and the motions of poles of the corresponding Hamiltonian density. In particular, they found analytic expressions for the forces acting between the solitons and used these to represent the N-soliton solution as an N-body interaction between classical particles. In this paper, they apply the methods of their previous analysis to obtain a dynamically equivalent particle representation for interacting Korteweg-de Vries solitons. The representation is faithful and a detailed analysis is present for the one- and two-soliton solutions. In these cases the particle motions accurately reflect the behavior of the solitons, giving, respectively, a uniform motion and a repulsive interaction. Furthermore, in the case of the two-soliton solutions, the phase shifts calculated from the particle trajectories are the same as those obtained from an asymptotic analysis of the waveforms. Because of the nature of the Korteweg-de Vries equation, there are important differences between the present analysis and that employed for the sine-Gordon equation and these are discused in some detail. A comparison with related work on other solutions of the Korteweg-de Vries is also presented. (20 refs.)

65029 Group-theoretical analysis of the sine-Gordon equation as a relativistic dynamical system. L.Martinez Alonso (Departamento de Metodos Matematicos de la Fisica, Univ. Complutense, Madrid, Spain).
J. Math. Phys. (USA), vol.24, no.4, p.982-9 (April 1983).
The inverse scattering transform method is used in order to achieve a group-theoretical characterization of the sine-Gordon equation considered as a relativistic dynamical system. The action of the Poincare group is formulated in terms of scattering data variables and the three basic components of the sine-Gordon field, namely, solitons, breathers and radiation are identified with simple canonical realizations of the Poincare group. In particular, the nonlinear flow associated with the one-parameter group of pure Lorentz transformations is integrated by means of the inverse scattering transform method. (15 refs.)

65030 Lorentz transformation properties of nonconserved charges. C.M.Bender, D.A.Williams (Dept. of Phys., Washington Univ., St. Louis, MO, USA).
J. Math. Phys. (USA), vol.24, no.4, p.990-5 (April 1983).
If a current $j^{\mu}(x)$ is conserved, then the charge Q defined as the three-space integral of $j^0(x)$ is a Lorentz scalar. In this paper the authors investigate the Lorentz transformation properties of Q assuming that $j^{\mu}(x)$ is not conserved; that is, $\partial_{\mu}j^{\mu}(x)\neq 0$. They find that Q, which now depends on time, transforms as the infinite direct sum of the spin-0 component of an infinite-dimensional indecomposable representation of the Lorentz group, $[(0,1)\rightarrow(1,0)]:[(0,1)\rightarrow(1,0)]\ \oplus\Sigma_{j=0\oplus}^{\infty}\ (0,2j+1)$, where they are using the Gel'fand, Milnos, and Shapiro (1963) notation. More simply, if $T^{\mu1\mu2\ldots\mu n}(x)$ is an n-index traceless, symmetric tensor density and $S(x)$ is a density transforming as the spin-0 component of the infinite-dimensional representation, they find that Q transforms as the infinite sum $S(x)+T(x)+T^{00}(x)+T^{0000}(x)+\ T^{000000}(x)+\ldots.$ (8 refs.)

65031 Can poles change color?. J.Tafel, A.Trautman (Inst. Fizyki Teoretycznej, Uniwersytetu Warszawskiego, Warsaw, Poland).
J. Math. Phys. (USA), vol.24, no.5, p.1087-92 (May 1983).
The definition of the total nonAbelian charge ('color') in a classical Yang-Mills theory is shown to require a careful analysis of the boundary conditions at infinity imposed on the potentials and on gauge transformations. The color current of a nonAbelian plane wave is found to be different from zero in the transverse gauge, though it vanishes in the null gauge. The color charge of a single pole, described by the Lienard-Wiechert potentials, is constant by virtue of the Yang-Mills equations. An approximate computation indicates that the total color charge of a system of particles may change in time, as a result of radiation. To make this result meaningful, it is necessary to find a method of fixing the allowed gauge transformations to those having a direction-independent limit at infinity. (16 refs.)

65032 Spinors in two dimensions. Ping Yip (Enrico Fermi Inst., Univ. of Chicago, Chicago, IL, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1206-12 (May 1983).
The issue of the meanings of 'spinors' in two-dimensional Minkowski spacetime is investigated. Spinors in two dimensions are defined and shown to behave like the familiar spinors in four dimensions. Both of them can be interpreted as square roots of vectors, and both of them describe fermions in a quantum field theory. The author also shows that an analogous version of the spin-statistics theorem holds in two-dimensional Minkowski spacetime. (6 refs.)

65033 Canonical structure of the CP_2^{n-1} model in some noncovariant gauges. E.Gozzi (Phys. Dept., City Univ. of New York, New York, NY, USA), A.Guha.
J. Math. Phys. (USA), vol.24, no.5, p.1213-18 (May 1983).
The canonical structure of the CP_2^{n-1} model is derived in four different noncovariant gauges using the Dirac method for constrained Lagrangian systems. A suitable quantization scheme is proposed for all n. (17 refs.)

65034 Conformal invariance conditions for spinor fields with gauge freedom. M.Legare (Centre de Recherche de Math. Appl., Univ. de Montreal, Montreal, Quebec, Canada).
J. Math. Phys. (USA), vol.24, no.5, p.1219-23 (May 1983).
The global invariance conditions are given for the (j,j') spinor fields with gauge freedom invariant under subgroups of C(3,1). The author formulates two propositions concerning the nonexistence of nontrivial fields with and without compact gauge freedom and applies them to the maximal noncompact subgroups of C(3,1). The author also determines explicitly the most general O(4) and O(2)×O(4) invariant (j,j') spinor fields with compact gauge freedom. (12 refs.)

65035 Self-dual Yang-Mills fields. J.R.Porter (Dept. of Math. & Statistics, Univ. of Pittsburgh, Pittsburgh, PA, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1224-32 (May 1983).
The realization of self-dual Yang-Mills fields as nonlinear superpositions of plane waves is treated in analogy with electromagnetism. Despite the nonlinear nature of the fields, there is a complete correspondence between the two theories. The asymptotic behavior of asymptotically flat fields is examined and the plane wave components are shown to decouple on $\mathcal{J}^-$ and on $\mathcal{J}^+$ for such fields and to exhibit the character of linear fields when viewed as propagating from $\mathcal{J}^{-1}$ to $\mathcal{J}^+$. (8 refs.)

65036 Self-dual Yang-Mills fields on Minkowski space-time. J.R.Porter (Dept. of Math. & Statistics, Univ. of Pittsburgh, Pittsburgh, PA, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1233-9 (May 1983).
Self-dual Yang-Mills fields are realized as superposition, but in a nonlinear context, of plane wave fields. The mathematical analysis of such superposition (and the inverse problem of decomposition) is given in terms of connections on the prime spin bundle over Minkowski space-time. This view leads naturally to the twistor construction for such fields given by Ward (1977) as well as a CR version of this construction. (3 refs.)

65037 On a class of synchronized observers attached to the Lorentzian structures. B.Coll, C.Moreno (Coll. de France, Paris, France).
J. Math. Phys. (USA), vol.24, no.5, p.1245-55 (May 1983).
The first-order evolution form for the Klein-Gordon equation is characterized by an operator $T(t)$ which, for inertial observers in the Minkowski space-time, is skew-self-adjoint with respect to the energy product. This fact is essential for a rigorous treatment of the equation. The authors prove that, in arbitrary Lorentzian structures, there always exists a class of 'synchronized observers' (equivalence class of physically admissible local charts), here called adjoint systems, for which this property of $T(t)$ remains true. They are completely determined by the Lorentzian structure, and, in this sense, they appear as a suitable generalization of the Killing vector fields. They obtain the definition equations for such observers and state some of their properties. A particular class of them, here called simple adjoint systems, has already been introduced (1980) for the study of the Klein-Gordon equation in arbitrary space-times, according with Lichnerowicz's quantization program (1964). (21 refs.)

65038 Minimal electromagnetic coupling schemes. II. Relativistic and nonrelativistic Maxwell groups. J.Beckers, V.Hussin (Inst. de Phys. au Sart Tilman, Univ. de Liege, Liege, Belgium).
J. Math. Phys. (USA), vol.24, no.5, p.1295-8 (May 1983).
For pt.I see ibid., vol.24, p.1286-94 (1983). Minimal electromagnetic coupling schemes entering into Klein-Gordon or Schrodinger equations are studied in connection with symmetries outside the symmetry groups of the corresponding free equations. The Schrader construction of the so-called (relativistic) Maxwell group is reviewed through group extensions of kinematical groups asso-

ciated with (constant and uniform) electromagnetic fields. The construction of the Galilean (nonrelativistic) Maxwell group is given. (13 refs.)

65039 Magnetic-charge conjugation and the topological nature of magnetic monopole. K.L.Chang (Dept. of Phys., Nat. Taiwan Univ., Taipei, Taiwan).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.574-8 (23 April 1983).
Formulates the electromagnetic field tensor for the Yang-Mills-Higgs system, with arbitrary isospin of Higgs fields. Instead of introducing the unit isovector explicitly, the electromagnetic field tensor is constructed to be of definite transformation property under an additional discrete symmetry operation, called magnetic-charge conjugation. The author also uses this criterion to demonstrate that the magnetic charge of the monopole can also be quantized in the model with a Higgs doublet. (8 refs.)

65040 Co-ordinates for fermions. K.Mita (Div. of Natural Sci. & Math., St. Mary's Coll. of Maryland, St. Mary's City, MD, USA).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.176-84 (21 March 1983).
The author presents an examination of the Dirac matrices as spin co-ordinate. The field depending on the Minkowski space-time x and the Dirac matrices γ is introduced. The orbital and spin parts of the angular momentum appear on an equal footing when x and γ are Lorentz transformed simultaneously. (14 refs.)

65041 Energetic stability criterion for a nonlinear spinorial model. A.Alvarez (Dept. de Fisica Teorica, Univ. Complutense, Madrid, Spain), M.Soler.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1230-3 (25 April 1983).
The time evolution of expanded and contracted solitary waves of the Dirac field with scalar self-interaction is exhibited. It is shown that the positivity of the second variation of the energy functional is not a necessary condition for the stability of these waves as has been recently suggested. (12 refs.)

65042 Some remarks on the symmetry algebras of soliton equations. T.Koikawa (Brookhaven Nat. Lab., Assoc. Univ. Inc., Upton, Long Island, NY, USA), R.Sasaki.
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.85-8 (21 April 1983).
For a wide class of soliton equations in $1+1$ dimensions an infinite set of symmetry transformations obeying the Kac-Moody Lie algebra is obtained. These symmetry transformations, however, can be applied only within a limited domain of the x (space) variable. This restriction applies, in particular, to the Heisenberg spin chain and the nonlinear Schrodinger equation for which a Kac-Moody structure was recently derived by Eichenherr, (1982). (9 refs.)

65043 Hadron spectrum, spontaneous breaking of Z(3) and fake loops in lattice SU(3). R.Gupta, A.Patel (California Inst. of Technol., Pasadena, CA, USA).
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.94-8 (21 April 1983).
The authors calculate the hadron mass-spectrum using the Wilson action and in the quenched approximation on a $6^3\times10$ lattice at $\beta=6.0$. They show the existence of long-lived metastable states of the gauge field, characterized by the eigenvalue of Z(3). The hadron masses are very different in these states and do not agree with the experimental value. (12 refs.)

65044 Background-field method and the renormalisation of non-Abelian gauge theories in curved space-time. D.J.Toms (Blackett Lab., Imperial Coll., London, England).
Phys. Rev. D (USA), vol.27, no.8, p.1803-13 (15 April 1983).
The gauge-invariant background-field approach is used to discuss a non-Abelian gauge theory containing fermions in curved space-time. Renormalisation of the theory at the one-loop level is presented using dimensional regularisation, heat-kernel techniques and a curved-space-time momentum-space method. (39 refs.)

65045 Inhomogeneous axial gauges. A.Burnel (Inst. de Phys. au Sart Tilman, Univ. de Liege, Liege, Belgium).
Phys. Rev. D (USA), vol.27, no.8, p.1830-9 (15 April 1983).
Inhomogeneous axial gauges are investigated chiefly in the framework of free-field (Abelian) theory. According to the spacelike or timelike character of the fixed four-vector and the nature of the coupling between the Lagrangian multiplier and the gauge fields, these gauges involve 2, 3, 4, or even 5 degrees of freedom, of which only two are physical. Gauges with 4 or 5 degrees of freedom involve an indefinite-metric formalism which is built with some details in complete parallelism with relativistic gauges. It is shown that the temporal gauges are not related to the Fermi gauge by a transformation $A'_\mu=A_\mu+\partial_\mu X$. The absence of Faddeev-Popov ghosts in the non-Abelian case is also discussed as well as the nature of the $(n.k)^{-\alpha}$ singularities in the propagator. (17 refs.)

65046 Nonperturbative approach to the infrared behaviour in physical charged sectors of gauge theories. E.d'Emilio (Istituto di Fisica, Univ. di Pisa, Pisa, Italy), M.Mintchev.
Phys. Rev. D (USA), vol.27, no.8, p.1840-51 (15 April 1983).
Physical charged fields in Abelian gauge theories with unbroken global gauge symmetry are constructed. The Bloch-Nordsieck approximation is then used for the investigation of their mass-shell behaviour in both cases of unconfined and confined global charge. In the former case (the authors consider spinor QED) physical charged fields are found to have vanishing infrared anomalous dimension and to admit the conventional Lehmann-Symanzik-Zimmermann (LSZ) limit. In the latter case (they consider a toy model obtained from QED by replacing the photon with a dipole gluon) it turns out that physical charged fields have zero LSZ limit and the relative Green's functions exhibit an essential singularity in the coupling constant g at $g=0$. Moreover, the perturbative expansion of these Green's functions, although asymptotic, is not Borel summable. (34 refs.)

65047 Four-dimensional CP^2 model on a lattice. K.M.Bitar, R.Raja (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1894-902 (15 April 1983).
The authors investigate the phenomenon of dynamical generation of gauge interactions from CP^{N-1} models in four dimensions. They do this for the CP^2 model on a lattice. The phase diagram of a model that interpolates between CP^2 and U(1) gauge theory on a lattice is first mapped out. The potential between static charges in various regions of this diagram is also measured. Contrary to hopes based on the large-N behavior of similar models in two dimensions and on the phase diagram, they find that the potentials generated by CP^2 do not bear any resemblance to those of U(1). They are rather similar to the Higgs phase of an Abelian gauge theory in both phases displayed by CP^2. (15 refs.)

65048 Time-dependent solutions of Yang-Mills equations related to the Wu-Yang magnetic monopole. H.Arodz (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).
Phys. Rev. D (USA), vol.27, no.8, p.1903-9 (15 April 1983).
A class of time-dependent, spherically symmetric solutions of Yang-Mills equations is found. The solutions describe a transformation of the initial color-electric and magnetic fields into the Wu-Yang magnetic monopole. (8 refs.)

65049 Class of very simple gauge theories which remain renormalizable even in the limit of infinite gauge coupling constant. S.Kaptanoglu (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1910-21 (15 April 1983).
A class of local gauge theories based on compact semisimple Lie groups is studied in the limit of infinite gauge coupling constant ($g=\infty$). In general, in this limit, the gauge fields become auxiliary in all gauge theories, and the system develops a richer structure of constraints. Unfortunately for most gauge theories, this limit turns out to be too singular to quantize and the theory ceases to be renormalizable. For a special class of gauge theories, however, where there are no fermions and there is only one multiplet of scalars in the adjoint representation, the author proves that a consistent renormalizable quantum theory exists even in this very singular limit. The author traces this exceptional behavior to a new local translationlike symmetry in the functional space that this class of gauge models possesses in the limit of infinite gauge coupling constant. By carrying out the constraint analysis, evaluating the Faddeev-Popov-Senjanovic determinant, and doing the functional integrations over the canonical momenta, the gauge fields, and most of the components of the scalar fields, the author obtains an extremely simple result with no non-Abelian structure left in it. For example, for group SU(2), the final answer reduces to the theory of a one-component self-interacting real ϕ^4 scalar field theory. Throughout the paper, the author uses functional methods and makes no approximations; the results are nonperturbative and exact. The author also discusses some of the possible implications of the results. (31 refs.)

65050 Surface terms and dual formulations of gauge theories. W.Mecklenburg, L.Mizrachi (Internat. Centre for Theoretical Phys., Trieste, Italy).
Phys. Rev. D (USA), vol.27, no.8, p.1922-31 (15 April 1983).
Previously proposed duality transformations for a pure non-Abelian gauge theory are carried out for a Yang-Mills theory with nonvanishing θ parameter. The authors argue that the theory is no longer self-dual even in the weak-coupling limit, as there is a surface term generated by the duality transformation. This surface term has nonzero Pontryagin index, hence it gets contributions from instanton-type configurations only. However, it does vanish for monopoles and vortices, therefore for this set of configurations self-duality is maintained in the weak-coupling region. (22 refs.)

65051 Convexity of the effective potential. R.W.Haymaker, J.Perez-Mercader (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1948-9 (15 April 1983).
The authors present a simple argument for the convexity of the effective potential $V(\phi)$. (7 refs.)

65052 Virial theorems for relativistic spin-$^1/_2$ and spin-0 particles. M.Brack (Inst. for Theoretical Phys., Univ. of Regensburg, Regensburg, Germany).
Phys. Rev. D (USA), vol.27, no.8, p.1950-3 (15 April 1983).
The authors derive virial theorems for relativistic particles which obey the Dirac or the Klein-Gordon equation and are bound in scalar- and/or vector-type potentials. (9 refs.)

65053 Quantization in the temporal gauge. Y.Kakudo (Dept. of Phys., Osaka Kyoiku Univ., Osaka, Japan), Y.Taguchi, A.Tanaka, K.Yamamoto.
Phys. Rev. D (USA), vol.27, no.8, p.1954-5 (15 April 1983).
It is pointed out that the validity of the canonical quantization procedure in the temporal gauge is very questionable. The quantization can be discussed only within the framework of the path-integral formalism. However, in that case, the vacuum is not an energy eigenstate. (3 refs.)

65054 Numerical studies of renormalization in SU(3) gauge theory in four dimensions. R.W.B.Ardill (Dept. of Maths., Royal Holloway Coll., Englefield Green, England), M.Creutz, K.J.M.Moriarty.
Phys. Rev. D (USA), vol.27, no.8, p.1956-9 (15 April 1983).
Wilson loops for pure SU(3) gauge theory are calculated by Monte Carlo simulations on an 8^4 lattice. Following renormalization-group arguments, Wilson loops on different length scales are compared. The only observed ultraviolet-stable fixed point lies at vanishing bare coupling. Asymptotic freedom is numerically verified. (7 refs.)

65055 Quasi-Abelian versus large-N_c linear confinement. S.L.Adler, H.Neuberger (Inst. for Advanced Study, Princeton, NJ, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1960-1 (15 April 1983).
In the quasi-Abelian approximation as well as in the large-N_c limit sources in the adjoint representation cannot be screened. Nevertheless, the two phenomena are different because the string tension is proportional to the square root of the Casimir operator in the first case and to the Casimir operator itself in the second. (8 refs.)

65056 Dirac equation revisited: charge quantization as a consequence of the Dirac equation. C.Radford (Dept. of Appl. Math., Univ. of Sydney, Sydney, New South Wales, Australia).
Phys. Rev. D (USA), vol.27, no.8, p.1970-1 (15 April 1983).
It is shown that the Dirac equation possesses an internal-symmetry group, which contains the usual electromagnetic gauge group. Well-known group-theoretical results then imply that charge is quantized. (8 refs.)

65057 The Wilson loop in a physical gauge. E.Guadagnini (Istituto di Fisica, Univ. of Pisa, Pisa, Italy).
Phys. Scr. (Sweden), vol.27, no.3, p.161-2 (March 1983).
The author determines the static potential between nonabelian charges at order g^4 by computing the Wilson loop, for a rectangular loop in the large-T limit. He uses a physical gauge obtained from the $A_0=0$ gauge by integrating over the longitudinal components of the vector potential. (5 refs.)

65058 Gauge theories of general form. P.M.Lavrov, I.V.Tyutin (Lenin Consomol Pedagogical Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.639-41 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.64-6 (July 1982). [received: May 1983]
The dependence of the unrenormalized effective action and the generating functional of vertex functions on canonical transformations is investigated in the paper, and the construction of the effective action in gauge theories of general form is described. (5 refs.)

65059 Polarization symmetry of vector fields. V.I.Strazhev, P.L.Shkol'nikov (Inst. of Mechanization of Agriculture, Belorussian SSR).
Sov. Phys. J. (USA), vol.25, no.7, p.652-5 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.77-80 (July 1982). [received: May 1983]
A group of additional invariance (polarization symmetry) of the Prock equations is considered, whose generators satisfy the algebra SU(3) (massive field) of SU(2) (massless field). The method of investigation developed in the paper is directly related to the physical content of the transformations of the symmetry being discussed: the change in the polarization field. The small Lorentz group is a sub-group of the transformations being discussed. Possible physical applications of polarization symmetry are discussed. (10 refs.)

65060 Low mass-scale parity restoration in expanded gauge theories. S.Rajpoot (Internat. Center for Theoretical Phys., Trieste, Italy).
Z. Phys. C (Germany), vol.17, no.3, p.259-63 (1983).
It is shown that schemes of grand unification with $SU(2n)^4$ gauge symmetry permit the embedding of the left-right symmetric $SU(2)_L \times SU(2)_R \times U(1) \times SU(3)^c$ intermediate symmetry at relatively low energies [between 250 GeV and a few TeV] as well as allows light unification mass-scales ($\leq 10^5$ TeV) if $n \geq 3$ for values of the weak angle $\mathrm{Sin}^2\theta_w$ and the strong coupling α_s in the ranges of $0.20 \leq \mathrm{Sin}^2\theta_w \leq 0.25$, $0.10 \leq \alpha_s \leq 0.15$. (13 refs.)

65061 Plasmon in the Coulomb gauge. T.Toimela (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).
Z. Phys. C (Germany), vol.17, no.4, p.365-6 (1983).
The non-perturbative plasmon contribution to the thermodynamic potential of the pure Yang-Mills theory is calculated in the Coulomb gauge. (11 refs.)

65062 Weak CP violation in a model with invisible axion. A.S.Joshipura (Indian Inst. of Technol. Kanpur, Kanpur, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.17
Weak CP violation in an $SU(2)_L \times U(1)_R \times U(1)_{PQ}$ model is considered. The extra global $U(1)_{PQ}$ is used to rotate away θ-term responsible for strong CP violation and also to label the fermionic generations in a manner proposed by Davidson and Wali. Flavour changing transitions caused by neutral Higgs scalars constitute a unique source of CP violations in the model. The ϵ parameter vanishes identically if the mass matrix M_d of down quarks is symmetric. The observed magnitude of ϵ can arise through exchange of Higgs scalar with mass around 1 TeV if M_d has a small antisymmetric part. The resulting theory is of microweak type.

65063 Mass generation of spin 3/2 fields in supersymmetric models. P.Dasgupta (Univ. of Kalyani, Kalyani, India), P.Pal.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.21
The problem of a massless spin 3/2 field acquiring mass through spontaneous symmetry breaking is studied in a supersymmetric model containing a Rarita-Schwinger and a vector field coupled suitably to a spin 1/2-spin O multiplet. A simple analysis is presented to show how supersymmetry transformations play a crucial role in ensuring consistency in such a theory. When gravitation is sought to be introduced through local supersymmetry, a stringent condition must be imposed on the Lagrangian to let the mechanism work and a new problem of consistency arises.

65064 Validity of Adler Bardeen theorem in a supersymmetric U(1) gauge model. B.Vijayalakshmi (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.22
The supermultiplet structure exhibited by the axial vector current $j_\mu{}^5$, the improved energy momentum tensor $\Theta_\mu{}^\nu$ and the supercurrent S_μ, in supersymmetric gauge theories, has led many authors to believe that the axial vector anomaly picks up radiative corrections. It is of interest to see under what conditions renormalisability can be restored. The author studies a supersymmetric U(1) gauge model in which the total anomaly is zero at the lowest order, the radiative corrections to these lower order graphs coming from each fermion loop turn out to be zero. The author indicates how this result can be extended to non-Abelian gauge theories. This result has significant implications to the question of renormalisability of supersymmetric grand unified models which are not left-right symmetric.

65065 Absence of quadratically divergent mass corrections in supersymmetric spontaneously broken U(1) gauge theories. T.R.Govindarajan (Dept. of Phys., India Inst. of Technol., Kanpur, India), R.K.Kaul, B.Vijayalakshmi.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.23
It is shown that in N=1 supersymmetric spontaneously broken U(1) gauge theories the Fayet Illioupoulos D term gets only logarithmically divergent corrections, when the traces of U(1) is arranged to be zero.

11.20 S-MATRIX THEORY

65066 Local *S*-matrix symmetries in Galilean field theories. W.-D.Garer (Inst. fur Theoretische Phys., Univ. of Gottingen, Gottingen, Germany).
J. Math. Phys. (USA), vol.24, no.5, p.1256-63 (May 1983).
A symmetry of the *S*-matrix is an operator that commutes with *S* and is additive, i.e. transforms an incoming *n*-particle state as a sum of its constituent one-particle states. For field theories with the Galilei group as a symmetry group and with nonvanishing elastic two-particle scattering amplitude, all *x*-matrix symmetries *Q* are determined that are local, i.e. transform local asymptotic fields into local ones. For scalar fields, *Q* is a linear combination of the ten generators of the Galilei group *G*, internal symmetries, and, possibly, two other generators *C* and *D*. By Galilean invariance, the generators of *G* are *S*-matrix symmetries in all field theories. In contrast, it depends on the specific field theory if *C* and *D* occur. If *C* is a symmetry, then *D* is, too, and vice versa. All scattering amplitudes are given that admit *C* and *D* as *S*-matrix symmetries. (29 refs.)

65067 Finitely many symmetries of the *S*-matrix. W.-D.Garber (Inst. fur Theoretische Phys., Univ. Gottingen, Gottingen, Germany).
J. Math. Phys. (USA), vol.24, no.5, p.1264-6 (May 1983).
S-matrix symmetries are operators that commute with the *S*-matrix and act additively on incoming *n*-particle states. For relativistic field theories, the structure of such symmetries is known if they arise from a local, conserved current density. In this paper it is shown that the same structural result is obtained if a relativistic field theory with finitely many but possibly nonlocal *S*-matrix symmetries is considered. (9 refs.)

65068 The partial-wave projected Coulomb *T* matrix for all *l* in closed hypergeometric form. H.van Haeringen (Dept. of Math., Delft Univ. of Technol., Delft, Netherlands).
J. Math. Phys. (USA), vol.24, no.5, p.1267-73 (May 1983).
The author obtains relatively simple closed expressions for the partial-wave projections of the off-shell Coulomb *T* matrix in the momentum representation, $\langle p|T_{cl}(k^2)|p'\rangle$, for all $l=0, 1, 2, \ldots$. These exact analytic expressions consist of three parts: (i) $\mathcal{F}_l$, simple combinations of the Jacobi polynomial $P_l^{(i\gamma,-i\gamma)}$ and the hypergeometric function ${}_2F_1(1,i\gamma;\ 1+i\gamma;.)$, with different arguments [γ is Sommerfeld's parameter; the Coulomb potential is $V_c(r)=2k\gamma/r$]; (ii) a polynomial $\mathcal{E}_l$; and (iii) $\mathcal{L}_l$=a polynomial times ln $[(p+p')^2/(p-p')^2]$. The polynomials under (ii) and (iii) are given in terms of the Jacobi polynomials $P_l^{(m,-m)}$, $m=01, 1, \ldots, l$. The author derives interesting relations, especially valuable for the theory of off-shell Coulomb scattering, and presents simple closed expressions for the special cases $l=0$, 1, and 2; $p' \to k$, $p' \to \infty$, and $\gamma \to 0$. (16 refs.)

65069 On a generalized F. Riesz problem. P.Dita (Inst. for Phys. & Nuclear Engng., Bucharest, Rumania).
J. Math. Phys. (USA), vol.24, no.5, p.1282-5 (May 1983).
The description of the pion-pion partial waves which are analytic and crossing symmetric is equivalent to solving a generalized Riesz problem (1920). A continuous family of solutions of this problem is constructed. (8 refs.)

11.30 SYMMETRY AND CONSERVATION LAWS

(see also 02.20 Group theory)

65070 SU(2)×SU(2) shift operators and representations of SO(5). J.W.B.Hughes (Dept. of Appl. Math., Queen Mary Coll., London, England).
J. Math. Phys. (USA), vol.24, no.5, p.1015-20 (May 1983).
SU(2)×SU(2) shift operators analogous to the SU(2) shift operators developed and used by the author (1978) for the classification and analysis of representations of Lie algebras in an SU(2) or SO(3) basis are obtained for the SU(2)×SU(2) Lie algebra in the case where one has an additional set of operators forming an irreducible four-dimensional tensor representation of SU(2)×SU(2). The shift operators obtained are used to treat the representations of SO(5) in an SU(2)×SU(2) basis. (25 refs.)

65071 Nonscalar extension of shift operator techniques for SU(3) in an O(3) basis. III. Shift operators of second degree in the tensor components. J.Van der Jeugt, H.E.De Meyer, G.Vanden Berghe (Rijksuniv. Gent, Gent, Belgium).
J. Math. Phys. (USA), vol.24, no.5, p.1025-31 (May 1983).
For pt.II see ibid., vol.22, p.2366 (1981). Shift operator $Q^k{}_l$ $(-2 \leq k \leq 2)$ of second degree in the tensor components q_μ $(-2 \leq \mu \leq 2)$ are constructed. Relations connecting quadratic shift operator products of the type $O^j{}_{l+k}Q^k{}_l$ or $Q^k{}_{l+j}O^j{}_l$, and of the type $Q^j{}_{l+k}Q^k{}_l$ are derived. The usefulness of these relations is demonstrated by the example of the $O^0{}_l$- and $Q^0{}_l$-eigenvalue calculation for various irreducible representations (p,q) of SU(3). (10 refs.)

65072 Indecomposable representations for para-Bose algebra. B.Gruber (Phys. Dept., Southern Illinois Univ., Carbondale, IL, USA), T.S.Santhanam.
J. Math. Phys. (USA), vol.24, no.5, p.1032-6 (May 1983).
A general study of the representations of the graded Lie algebra of para-Bose oscillators is given. Besides realizing the standard representations, the authors also find some interesting indecomposable (not fully reducible) representations. (10 refs.)

65073 Minimal electromagnetic coupling schemes. I. Symmetries of potentials and gauge transformations. J.Beckers, V.Hussin (Inst. de Phys. au Sart Tilman, Univ. de Liege, Liege, Belgium).
J. Math. Phys. (USA), vol.24, no.5, p.1286-94 (May 1983).
Minimal electromagnetic coupling schemes entering into Klein-Gordon or Schrodinger equations are studied in connection with symmetries inside and outside the symmetry groups of the corresponding free equations. Subsymmetries of relativistic potentials are classified up to conjugacy under the kinematical groups of the associated (constant and uniform) electromagnetic fields. Through invariance conditions on (physical) four-potentials a maximal character of the symmetry is obtained leading to the maximal symmetry groups of the corresponding wave equations with interaction. Usual and compensating gauge transformations are analyzed within the context of such invariance conditions applied to arbitrary electromagnetic fields. (22 refs.)

65074 Generalized Hooke groups and the mass-spectrum problem. D.Beau (Phys.-Math., Faculte des Sci. Mirande, Dijon, France).
J. Math. Phys. (USA), vol.24, no.5, p.1299-310 (May 1983).
The author briefly recalls the notion of internal structure and the relativistic covariant method [introduced in Beau and Horchani, J. Math. Phys.20, 1700 (1979)] of unifying external and internal structures leading to a kinematical Lie algebra. In this framework the author proposed a concept of dynamical development of the physical systems defined by this Lie algebra. So he obtains some Lie algebras, a generator of which (the Hamiltonian) gives rise to various mass formulas capable of describing the hadron spectrum; he makes use of both unitary global representations and partially integrable Schur-irreducible symmetric load representations. (26 refs.)

65075 Mass splitting between the supersymmetric partners of quarks and leptons. T.K.Kuo, N.Nakagawa (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.560-2 (23 April 1983).
It is shown that superpartners of the matter fields induce significant corrections to the mass of W-bosons and hence also the value of the ρ-parameter. As a result, an upper bound $\Delta m \lesssim 100$ GeV is obtained for mass splittings among members of the SU_2-doublet smatters. (8 refs.)

65076 Transformation coefficients between SO(6) and SU(4) Gelfand-Zetlin states. Yu Zu-rong (Nanjing Univ., Nanjing, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.121-5 (Jan. 1983). In Chinese.
Gives a method of calculating the transformation coefficients between SO(6) and SU(4) Gelfand-Zetlin states. (7 refs.)

65077 Charmed baryon magnetic moments in broken SU(8) model. C.P.Singh, K.P.Tiwari (Dept. of Phys., VSSD Coll., Kanpur, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.19
The magnetic moments of charmed baryons are studied in the broken SU(8) frame work. By including the additional symmetry breaking effects due to quark masses, the moments are calculated and compared with other formalisms.

11.60 COMPLEX ANGULAR MOMENTUM; REGGE FORMALISM

(see also 03.80 General theory of scattering, 12.40M in strong interactions)

65078 On the complex angular momentum theory of scattering. K.-E.Thylwe (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
J. Phys. A (GB), vol.16, no.6, p.1141-53 (21 April 1983).
A contribution to the theory of complex angular momentum techniques in the field of atomic and molecular collisions is given. The author derives a new, flexible representation of the scattering amplitude on the basis of realistic assumptions for the behaviour of the *S*-matrix in the complex angular momentum plane. The representation has the form of a sum of steepest-descent integrals, *S*-matrix residue terms and a symmetry-type background integral. The flexibility is due to the presence of two integer parameters which may be chosen conveniently so as to make the residue sums sufficiently convergent and to minimise the total number of important terms. (20 refs.)

12.00 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received) See Entry 64598

12.10 UNIFIED FIELD THEORIES AND MODELS

65079 Spontaneous gauge symmetry breaking in nonminimal supersymmetric grand unified theories. J.Kubo, S.Sakakibara (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
J. Phys. G (GB), vol.9, no.5, p.475-96 (May 1983).
In supersymmetric grand unified theories with the unified group larger than SU(5), it is required that gauge symmetry is spontaneously broken down to

the effective-low-energy group $SU(3)_c \times SU(2)_w \times U(1)\gamma$ without breaking supersymmetry. After studying some possible symmetry-breaking patterns which are realised by combinations of Higgs superfields in some lower-dimensional representations, the authors apply the results to several examples with the unified groups SU(6), SU(7) and SO(10). (41 refs.)

65080 Fermion-induced monopole-antimonopole annihilation. A.F.Grillo, Y.Srivastava (Lab. Nazionali, Istituto Nazionale di Fisica Nucleare, Frascati, Italy).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.579-82 (23 April 1983).
Monopole-antimonopole annihilation is reconsidered taking into account the peculiar behaviour of the baryon-number-violating monopole interactions. The authors review the problem of cosmological monopole abundance which can be (almost) solved without reference to inflation or more radical alternatives. (6 refs.)

65081 Neutron oscillations in a periodically varying magnetic field. G.D.Pusch (Phys. Dept., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.149-58 (21 March 1983).
Transforms the driven-neutron-oscillation problem into a form similar to a magnetic-resonance problem in an internal space, and obtain an approximate analytical solution in the neighbourhood of the resonances. The results are in good agreement with the numerical work of Arndt, Prasad and Riazuddin (1981). The author finds that the n̄ probability is quite insensitive to variations in magnetic-field strength and driving frequency when near a resonance maximum, the only critical aspect being the alignment between the static and oscillating fields. (18 refs.)

65082 Non-abelian conformal gravity as the origin of strong interactions. H.Saller (Max-Planck-Inst. fur Phys. & Astrophys., Werner-Heisenberg-Inst. fur Phys., Munich, Germany).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.159-75 (21 March 1983).
A metric tensor of gravity originating as a composite structure from basic spinor fields naturally carries also the internal symmetry properties of the underlying spinor fields. The closeness of the grand-unification breakdown mass to Planck's mass suggests an interpretation of the strong lepton-quark symmetry, e.g. SU_4, as an internal group also relevant for the dilatation. Spontaneous breakdown of dilatation and lepton-quark symmetry are closely related. Indefinite metric, dangerous for energies of the order of Planck's mass, seems to be an unavoidable consequence of a spontaneous dilatation breakdown. (15 refs.)

65083 Classical upper bounds for grand-unified monopole masses. A.N.Schellekens, C.K.Zachos (Fermi Nat. Accelerator Lab., Batavia, Il, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1242-5 (25 April 1983).
In addition to being bounded from below by the Prasad-Sommerfield limit, monopole masses are also bounded from above by the limit in which the scalar field variables are frozen to their vacuum values. This upper bound is close to the lower one: the single-, double-, and triple-strength SU(5) monopoles are found to have their masses bound in $m \leq M \leq m \times 1.7867$, $2m \leq M \leq 2m \times 2.0741$, and $3m \leq M \leq 3m \times 2.3155$, respectively, where $m = 3M_x/8\alpha$. (16 refs.)

65084 Neutrinoless double beta decay in the case of Dirac neutrinos. K.Enqvist (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland), J.Maalampi, K.Mursula.
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.89-93 (21 April 1983).
The possibility of generating neutrinoless double beta decay with Dirac neutrinos is discussed. Two scenarios with very different signatures are presented, one with a left-handed and the other with a right-handed lepton number violating electron-neutrino interactions. An example of a gauge model with the latter kind of coupling is given. (10 refs.)

65085 Generalized projection matrices for nonsupersymmetric and supersymmetric grand unified theories. Chang-Ho Kim, In-Gyu Koh, Young-Jai Park, Kee Yong Kim, Yongduk Kim (Dept. of Phys., Sogang Univ., Seoul, Korea).
Phys. Rev. D (USA), vol.27, no.8, p.1932-44 (15 April 1983).
The authors obtain the generalized projection matrices which can easily generate subalgebras and their representations of a simple Lie algebra for all classical groups of arbitrary ranks. In contrast to the nonsupersymmetric grand unified theories, all the real groups and representations can be candidates in the supersymmetric grand unified theories. Also they explicitly include all possible U(1) factors which are crucial in nonsupersymmetric and supersymmetric grand unified theories. (21 refs.)

65086 An SU(4)⊗SU(2)⊗U(1) unified model. Xu De-zhi (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.13-19 (Jan. 1983). In Chinese.
Proposes an $SU(4) \otimes SU(2) \otimes U(1)$ unified model, in which the stratons and leptons of every generation belong to the same multiplet, and the leptons will couple to the the stratons. However, this kind of coupling cannot cause the proton decay, and has only some effects in high energy scattering. This model predicts the existence of two neutral intermediate bosons, instead of one, and the value of Weinberg angle to be $\sin^2\theta_w = 0.25$. The neutrinos have reasonable masses in the model. (6 refs.)

65087 A comment on the light-fermion mass hierarchy problem in SU(9) grand unified models. Dong Fang-xiao, Tu Tung-sheng, Xue Pei-you (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.20-7 (Jan. 1983). In Chinese.
According to the idea of Barr (1980) for solving the light-fermion mass hierarchy problem, all possible $SU(9)$ grand unified models are systematically examined. The conclusion is negative, there is no hope of realizing the $(\alpha^2, \alpha, 1)$ pattern in $SU(9)$ models. (5 refs.)

65088 Fermions in the SU(5) colorless dyon field. Ma Zhong-Qi (Inst. of High Energy Phys., Acad. Sinica, Peking, China), Tang Ju-fei.
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.35-41 (Jan. 1983). In Chinese.
The Prasad-Sommerfield-like, colorless and finite-mass dyon analytic solution in $SU(5)$ ground unified model is found. It is the only physical dyon solution so far. In the $SU(5)$ model the Dirac equation of fermions in the dyon field is derived concretely, and the mathematical method for solving the equation is pointed out and discussed. (19 refs.)

65089 Unified theory of weak, strong, and electromagnetic interactins: spontaneous breaking of the symmetry of a vacuum. A.N.Kushnirenko (Inst. of Problems in Materials Sci., Acad. of Sci., Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.7, p.659-63 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.84-8 (July 1982). [received: May 1983]
It is shown that the presence of the additional symmetry discussed (1982) induces additional gauge fields, which can be held responsible for strong interactions of nucleons. In the spontaneous breaking of the symmetry of a vacuum the particles corresponding to these fields acquire masses. The masses are estimated. It is noted that in a special case the given theory goes over to the Weinberg-Salam theory describing weak and electromagnetic interactions of leptons. (2 refs.)

65090 Proton decay in terms of an effective baryon-lepton transition. W.Lucha, H.Stremnitzer (Inst. fur Theoretische Phys., Univ. Wien, Wein, Austria).
Z. Phys. C (Germany), vol.17, no.3, p.229-42 (1983).
The authors calculate the two-body decay rates for the hadronic and electromagnetic decays of proton and neutron in terms of the effective baryon-lepton transition matrix element. Further ingredients like PCAC and vector meson dominance are used. They compute these transition amplitudes within the framework of a relativistic quark model involving Bethe-Salpeter amplitudes and present the nucleon lifetimes and branching ratios of various decay modes for three different grand unification models. (53 refs.)

65091 Geometric hierarchy for the supersymmetry breaking scale. C.Oakley, G.G.Ross.
Report RL-83-012, Rutherford Appleton Lab., Chilton, Oxon., England (Jan. 1983), 10 pp.
Considers F type supersymmetry breaking through O'Raifeartaigh-Fayet potentials. It is shown how a class of models gives rise to a supersymmetry breaking scale reduced relative to the fundamental scale M of the potential by powers of (M/M_{Planck}). The role of R invariance in such potentials is discussed. (12 refs.)

65092 Breaking of manifest left-right symmetry in SO(10) GUTs. A.Raychaudhuri (Dept. of Pure Phys., Univ. of Calcutta, Calcutta, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.15
The intriguing possibility of low energy restoration of parity requires the right-handed weak gauge bosons to be light. For this scenario to be consistent with the K_L-K_S mass difference the Cabibbo angles in the left- and the right-handed sectors have to be different. SO(10) is the smallest grand unifying group that can accomodate left-right symmetry. Fermion mass generation in SO(10) through Yukawa couplings is examined for an acceptable breaking of manifest left-right symmetry without disturbing the proper lepton mass spectrum predictions.

65093 Resolution of compositeness of Higgs bosons. R.M.Godbole (Inst. of Sci., Bombay, India), P.Roy.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.16
The ZHZ vertex in the W-S model will have a structure if the Higgs boson were composite. The presence of such a structure can be detected by doing an experimental analysis of the muon pair mass distribution in $e^+e^- \rightarrow Z \rightarrow H\mu^+\mu^-$ (for a Higgs boson mass between 10 GeV and 40 GeV).

65094 Cabibbo mixing, natural flavour conservation and CP violation in a left right symmetric electroweak gauge model with horizontal symmetry.. A.K.Ray, K.K.Kundu, K.Niyogi (Dept. of Phys., Visva-Bharati Univ., Santiniketan, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.18
Cabibbo mixing for a two generation model of quarks based on the gauge group $SU(2)_L \times SU(2)_R \times U(1) \times U(1)$ with a proper choice of the Higgs constant is discussed. The model leads to natural flavour conservation if a suitable discrete symmetry is introduced. CP violation arises through Kobayashi-Masakara mechanism as well as Higgs exchange, which in some situations is solely responsible for CP violation.

65095 Asymmetry parameters in the polarized e-p and e-d scattering within the framework of $SU(2)_L \times U(1) \times U(1)$ and SO(10) gauge models. M.Kundu, K.Niyogi, A.K.Ray, B.Talukdar (Dept. of Phys., Visva-Bharati Univ., Santiniketan, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.20
The predictions of $SU(2) \times U(1) \times U(1)$ and SO(10) gauge models for the asymmetry parameters A^-, B^-, C_L and C_R in the deep inelastic scattering of polarized electrons and positrons by unpolarized protons and deuterons are compared with those calculated in the Weinberg Salam model for different values of y.

65096 n-n̄ oscillations in SU(5) GUT and left-right asymmetry. U.Sarkar (Dept. of Pure Phys., Univ. of Calcutta, Calcutta, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.25
The minimal theory for unifying the strong, weak and electromagnetic interactions is the grand unified theory based on the gauge group SU(5). This theory cannot accommodate within itself left-right symmetry. Here the left-right asymmetry is reflected in, among other things, n-n̄ oscillations with left-handed and right-handed particles. In both cases, a nonminimal Higgs sector is necessary. However, for the n-n̄ oscillations with left-handed particles a Higgs scalar with hypercharge $Y=2$ must acquire VEV in addition to the minimal Higgs scalars already present in the theory. But for the n-n̄ oscillations with right-handed particles no nonminimal Higgs needs to acquire VEV.

65097 Do mass scales for observable parity restoration and n-n̄ oscillation exist in SU(16):. M.K.Parida (Post-Graduate Dept. of Phys., Sambalpur Univ., Sambalpur, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.26
A subtraction procedure proposed earlier for GUTs, which seems to be essential for a correct application of extended survival hypothesis, is used to search for intermediate mass scales for parity restoration and n-n̄ oscillation in SU(16) grand unification scheme. It is found that in two different chains, where the left-right symmetry is broken at a lower mass scale than the quark-lepton symmetry, low-mass (~100 GeV) parity restoration is allowed for $\sin^2\Theta_W \simeq .235$, but without observable n-n̄ or H-H oscillations. In a third chain where left-right symmetry is broken at a higher mass scale, observable n-n̄ and H-H oscillations and proton decay are allowed for $\sin^2\Theta_W \simeq .235$ along with a right-handed neutral boson mass around 100 GeV.

65098 A new subtraction procedure for GUTs and mass scales for parity restoration and n-n̄ oscillation in SO(10). M.K.Parida (Post-Graduate Dept. of Phys., Sambalpur Univ., Sambalpur, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.27
While calculating the Higgs contributions to the evolution of coupling constants in grand unified theories (GUTs) using extended survival hypothesis, the use of a new subtraction procedure is essential for a correct application of the hypothesis. When applied to two different chains of symmetry breaking of SO(10), where $G' \equiv SU(2)_R X U(1)_{B-L}$ is broken, but at mass scales lower than the quark-lepton-unification mass (M_X), low-mass parity restoration around 100 GeV is allowed.

12.20D Specific calculations and limits of quantum electrodynamics

65099 Supersymmetry breaking in three dimensions. C.P.Burgess (Center for Theoretical Phys., Univ. of Texas, Austin, TX, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.459-68 (2 May 1983).
One-loop corrections to the effective potential in three-dimensional supersymmetric massless scalar electrodynamics are calculated to see whether or not they spontaneously break supersymmetry. It is found that neither the supersymmetry nor the U(1) gauge invarance is broken by one-loop effects. (6 refs.)

65100 The discovery of a magnetic monopole and its implication for quarks. L.H.Ryder (Phys. Lab., Univ. of Kent, Canterbury, England).
Eur. J. Phys. (GB), vol.3, no.4, p.206-9 (1982).
Concerns the recent claim to have discovered a magnetic monopole by observing a change in the flux trapped in a superconducting ring. It is shown, in simple terms, how to calculate the magnetic charge in this type of event. Dirac's quantisation condition, according to which the product of any electric and any magnetic charge is quantised, is derived, and it then follows immediately that the magnetic charge which has been observed only satisfies Dirac's condition if it is the electron that has the 'fundamental' electric charge; the possibility that quarks carry the fundamental charge is ruled out. (5 refs.)

65101 A new approach to the conformal invariance problem in quantum electrodynamics. M.Ya.Palchik (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR).
J. Phys. A (GB), vol.16, no.7, p.1523-7 (11 May 1983).
A formulation of conformal-invariant quantum electrodynamics is suggested, in which new representations of the conformal group are used. This results in unusual laws for the electromagnetic potential and the transverse part of the current, and modified expressions are obtained for the vertex and three-point Green function. The program of the asymptotic charge calculation within the frames of conformal-invariant skeleton theory is formulated. (7 refs.)

65102 Dirac-bracket formulation of QED in the superaxial gauge. H.J.Rothe, K.D.Rothe (Inst. fur Theoretische Phys., Univ. Heidelberg, Heidelberg, Germany).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.129-48 (21 March 1983).
Presents a Hamiltonian formulation of QED in a completely fixed axial gauge using the Dirac-bracket formalism. The authors achieve this by starting from a first-order Lagrangian where $F^{\mu\nu}$, A^μ, ψ and ψ^+ are considered to be the dynamical variables. In this formulation the dynamics of the system is subject to a large number of constraints. In fact, QED in the axial gauge already provides a very nontrivial example for the application of the Dirac-bracket formalism that leads to field commutators which, in contrast to previous attempts made by other authors, are consistent with the required asymptotic properties of the fields. Furthermore, starting from this Hamiltonian formulation, they derive the corresponding path integral representation for the generating functional in terms of the co-ordinate fields. (10 refs.)

65103 One-loop renormalisation of Coulomb-gauge QED. G.S.Adkins (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1814-20 (15 April 1983).
The author presents a physically motivated renormalisation scheme for Coulomb-gauge QED. This scheme is useful in calculations involving QED bound states. He implements this scheme to one loop by calculating the electron self-energy, the electron self-mass, and the renormalisation constants Z_1 and Z_2. Formulas for the dimensional regularisation of some noncovariant integrals useful in one-loop Coulomb-gauge calculations are given. (5 refs.)

65104 Transverse vertex and gauge technique in quantum electrodynamics. J.E.King (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1821-9 (15 April 1983).
It is known that the Schwinger-Dyson equation for the electron propagator $S(p)$ in quantum electrodynamics is linear if the full vertex in this equation is approximated by a special form (the longitudinal vertex) which satisfies the Ward identity and which yields exact results in the infrared regime. However, the approximate equation cannot be multiplicatively renormalised (nor is it properly gauge covariant) using only the longitudinal vertex. In the present work, the author constructs a transverse (i.e. identically conserved) vertex which, when added to the longitudinal vertex, yields an equation for $S(p)$ which remains linear and exact in the infrared, but which is multiplicatively renormalisable and gauge covariant. In the ultra-violet regime, the equation gives the known results of renormalisation-group-improved perturbation theory. The essential difficulty which is overcome by the present analysis is that of overlapping divergences, which are mishandled if only the longitudinal vertex is kept. (11 refs.)

65105 Landau's asymptotic solution of the vertex function in QED. E.B.Manoukian (Dept. of Nat. Defence, Royal Military Coll. of Canada, Kingston, Ontario, Canada).
Phys. Rev. D (USA), vol.27, no.8, p.1945-7 (15 April 1983).
The author considers finite massless QED with the electron mass totally dynamical of origin and the fine-structure constant as the (infinite order) zero of the Callan-Symanzik function. In spacelike regions, the electron propagator (in the generalized Landau gauge) and the photon propagator are then proportional to their free counterparts, and the integral equation for the vertex function Γ_σ may be written solely as a function of Γ_σ itself. Landau's approximation is used to obtain the asymptotics for $\Gamma_\sigma(p,p-k;k)$ for $p^2,k^2 \rightarrow \infty$, $p^2/k^2 \rightarrow 0$ in spacelike regions. (8 refs.)

65106 Green function of an electron and a scalar particle in external electromagnetic fields of special form. I.A.Khokhlov (Tomsk Medical Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.634-8 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.59-63 (July 1982). [received: May 1983]
Using the results of Khokhlov (1982), the relation between Green functions of an electron and a scalar particle in external electromagnetic fields of the following structure is investigated: $H=[n \times E]+H_3 n$, where n is a constant unit vector. The causative Green functions of an electron and a scalar particle are found in a field which is a combination of a longitudinal electric wave and a plane wave propagating in a single direction (along n). 65107 Interaction of a spin-1/2 tachyon with a spin-1/2 bradyon and a tachyon-bradyon model. S.K.Srivastava (Government Coll., Port Blair, India).
J. Math. Phys. (USA), vol.24, no.5, p.1311-16 (May 1983).
Interaction of a spin-1/2 tachyon with the gravitational field of a spin-1/2 bradyon is investigated in the background of Schwarzschild geometry. A tachyo-bradyon bound system (PTBBS) is proposed. In PTBBS, a tachon revolves around a bradyon in a circular orbit. It is found that as the tachyon goes away from the bradyon, it emits energy under a certain condition; but if this condition is not satisfied, the tachyon gains energy while going away from the bradyon. Also, PTBBS is compared with Bohr's hydrogen atom model. In the end, the possibility of formation of PTBBS is discussed. (9 refs.)

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

65108 Why QCD lattice theory is important to spin physicists. C.Rebbi (Brookhaven Nat. Lab., Upton, NY, USA).
AIP Conf. Proc. (USA), no.95, p.289-91 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Aspects of lattice gauge field theories which may be of relevance for spin physics are reviewed. (5 refs.)

65109 Spin physics and inclusive processes at short distances. N.S.Craigie (Internat. Centre for Theoretical Phys., Trieste, Italy).
AIP Conf. Proc. (USA), no.95, p.292-309 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
This talk is divided into an introduction: Why Spin Physics at Short Distances; a second chapter on factorization theorem in perturbative QCD and helicity asymmetries in inclusive processes; a third chapter on effect of higher order radiative corrections on helicity asymmetries; a fourth chapter on higher order power mechanisms at intermediate p_T; a fifth chapter on difficulties in understanding transverse spin in perturbative QCD and a final chapter on

helicity asymmetries at short distances as a means of probing supersymmetric QCD interactions. (23 refs.)

65110 Qualitative features of fixed angle elastic scattering in perturbative QCD. B.Pire (Stanford Linear Accelerator Center, Stanford, CA, USA), J.P.Ralston.
AIP Conf. Proc. (USA), no.95, p.347-51 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors point out recent qualitative features predicted by perturbative QCD that make fixed angle elastic scattering a useful testing ground. They emphasize two aspects: the asymptotic power behavior and the coherent effect of imaginary parts of Sudakov corrections. The second feature, called the chromo-Coulomb phase, can introduce oscillatory components into the cross-section ($d\sigma/dt$) and in the spin parameters (e.g. A_{nn}) at 90° and medium energy. (7 refs.)

65111 Spin effects in large angle two body reactions at high energy. P.Chiappetta, J.Soffer (Centre de Phys. Theorique, CNRS, Marseille, France).
AIP Conf. Proc. (USA), no.95, p.352-4 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Large angle two body processes at high energies are considered a most important class of reactions to test our understanding and on the behaviour of hadronic form factors which contain basic information about the composite nature of hadrons. For massless quarks, the QCD vector interaction preserves the quark helicity and this strong spin constraint leads to a selection rule for hadron helicities. (7 refs.)

65112 A self-consistent treatment of a non-linear effects in a model quark-antiquark-gluon system. D.E.L.Pottinger, R.C.Warner (Dept. of Natural Philosophy, Glasgow Univ., Glasgow, Scotland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.336-58 (2 May 1983).
After presenting a formalism that is suitable for treating non-linear effects in a quantum setting, the authors analyse a model quark-antiquark-gluon system. This model is a truncated version of the full QCD Coulomb gauge hamiltonian in the heavy quark mass limit. Using a variational approximation, they show that the quark-antiquark-gluon singlet state becomes lower in energy than the pure quark-antiquark singlet for moderate values of the strong coupling constant, thus becoming the ground state of the system. (13 refs.)

65113 Numerical simulations of quantum chromodynamics. H.W.Hamber (Inst. for Advanced Study, Princeton, NJ, USA), E.Marinari, G.Parisi, C.Rebbi.
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.99-104 (21 April 1983).
A previously proposed method to perform Monte Carlo simulations with dynamical fermions is applied to lattice QCD. The main features of the computational technique are reviewed and results for some selected quantities, such as the average plaquette action and the quark condensate $\langle\bar{\psi}\psi\rangle$ are presented. Both the dependence on the quark mass and on the number of flavors are considered. An estimate of the scale parameter in the presence of fermions is given. (16 refs.)

65114 Failure of the Bloch-Nordsieck Mechanism in perturbative QCD. H.Banerjee (CERN, Geneva, Switzerland), A.Chatterjee, M.Sengupta.
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.105-8 (21 April 1983).
The authors find by direct diagram-wise calculation in Feynman gauge that at the two-loop level the Bloch-Nordsieck cross sections for the process (A)$q\bar{q}\rightarrow\gamma^*$ and its inverse (B)$\gamma^*\rightarrow q\bar{q}$ are both infrared divergent. The uncancelled infrared divergent piece in the BN cross section for either process has a leading behaviour which is double logarithm and not single logarithm as found for process (A) by several authors. (8 refs.)

65115 General infrared and ultraviolet properties of the gluon propagator in the axial gauge. G.B.West (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
Phys. Rev. D (USA), vol.27, no.8, p.1878-93 (15 April 1983).
Some general properties of the gluon propagator are studied in the axial gauge with emphasis on its infrared and ultraviolet behavior. In spacelike gauges the author derives a Lehmann representation and consequently a Kallen sum rule for Z_3. He investigates in some detail the apparent inconsistency between $Z_3>1$ (antiscreening and the origin of asymptotic freedom) and the positivity of the Hilbert space due to the absence of ghosts which suggests $Z_3<1$. He shows that in timelike gauges there is no Lehmann representation so that the propagator is no longer analytic in its virtual mass parameter. General positivity coupled with these results restricts certain IR singularities from being any worse than they are in QED, so consequently it is not possible to use the IR behavior of the propagator in this gauge (whether timelike or spacelike) as a signal for confinement if the Wilson loop is used as the criterion. He also shows that a judicious use of the renormalization group involving a variation of the axial-gauge parameter allows one to drive the theory into the IR in such a way that the effective coupling constant is the asymptotically free one. He uses this result to show that the presence of nonperturbative contributions of the generic form e^{-c/g^2} associated with instantons leads to a power-law correction to the IR behavior of the propagator. (28 refs.)

65116 An alternative implementation of the 'principle of minimal sensitivity'. J.C.Wrigley (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Phys. Rev. D (USA), vol.27, no.8, p.1965-7 (15 April 1983).
The author presents a simplified method of applying Stevenson's (1981) 'principle of minimal sensitivity' to perturbative calculations to all orders of quantum chromodynamics. In the next-to-leading-order case a direct comparison with the 'fastest apparent convergence' criterion is possible. (12 refs.)

65117 Comment on 'An alternative implementation of the "principle of minimal sensitivity"'. P.M.Stevenson (CERN, Geneva, Switzerland).
Phys. Rev. D (USA), vol.27, no.8, p.1968-9 (15 April 1983).
The author explains that the difficulties encountered by Wrigley (1983) in the preceding paper arise only because he is attempting to find the stationary value of an undefined function. (6 refs.)

65118 Precocious scaling and nonperturbative effects in QCD. W.Kummer (Inst. fur Theoretische Phys., Tech. Univ. Wien, Wien, Austria).
Z. Phys. C (Germany), vol.17, no.4, p.329-33 (1983).
The onset of nonperturbative effects in QCD is studied in two ways: (1) by means of the nonvanishing vacuum expectation value of $\langle g^2F^2\rangle$ introduced by Shifman, Vainshtein and Zakharov (1978); (2) using a finite energy sum rules (FESR) for the renormalization group function β. The author's considerations are based upon the recently proposed 'physical' β_{MMOM}, which is gauge invariant and shows explicit mass-decoupling. (14 refs.)

65119 Hadronic local fields in QCD. M.Azam, P.P.Divakaran (Tata Inst. of Fundamental Res., Bombay, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.5
A systematic procedure for the construction of local fields of definite spin for hadrons as composites of quarks and gluons is outlined and illustrated.

65120 On some aspects of asymptotic freedom. P.K.Patnaik (Dept. of Phys., Sambalpur Univ., Sambalpur, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.7
Analysing the Vacuum polarisation diagrams the author rederives the expression $\alpha_x(q^2)=1/(a+b\ln(Q^2/\wedge^2))$. Both a and b are found to be Q^2 dependent. The new expression, when applied to the results of specific processes is almost constant $\wedge$ for different Q^2 values. The applicability of this formula at present Q^2 values does not rule out the possibility of having more than sixteen quark flavours.

12.35E Applications of quantum chromodynamics to particle properties and reactions

65121 Meson widths and form factors at intermediate momentum transfer in non-perturbative QCD. B.L.Ioffe, A.V.Smilga (ITEP, Moscow, USSR).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.373-407 (2 May 1983).
A general method is proposed for the QCD based calculations of form factors at intermediate Q^2 and of the partial widths of the low-lying mesonic resonances. The basic idea is to use the QCD sum rules for the vertex functions and to saturate their Borel transform by the lowest mesonic states. With this method the pion electromagnetic form factor along with electromagnetic form factors of ρ and A_1 mesons and transition form factors $\gamma\pi\rightarrow A_1$ at $0.5\lesssim Q^2\lesssim 3$ GeV^2 are calculated. The widths $\rho\rightarrow 2\pi$ and $A_1\rightarrow\rho\pi$ are also determined. The results are in a good agreement with experiment. (31 refs.)

65122 Electrically neutral quarks: production of fractionally charged hadrons. R.V.Wagoner (Dept. of Phys., Stanford Univ., Stanford, CA, USA), I.Schmitt, P.M.Zerwas.
Phys. Rev. D (USA), vol.27, no.8, p.1696-704 (15 April 1983).
The authors explore some observational consequences of the existence of electroweak neutral, colour-triplet fermions, which combine with ordinary quarks to form fractionally charged hadrons (FCH) within QCD. Within the standard big-bang model, it is found that at least $\sim 4\times 10^{-20}$ FCH per photon survive from the early Universe. Calculations of their production in hadron-hadron and e^+-e^- colliders set a lower limit of ~ 10 GeV to their mass. The cosmic-ray-produced abundance of FCH at the surface of the Earth and Moon is also calculated. Within a more general framework, they show that a (nonzero) cosmic abundance of fractionally charged particles per nucleon smaller than $\sim 7\times 10^{-12}$ (outside stars) would be incompatible with the validity of standard (confining) QCD and the standard big-bang model. (34 refs.)

65123 The QCD behaviour for the valence quark distribution function of pions in the leading logarithm approximation and relevant differential cross-section. Zhang Mei-man, Shen Qi-xing, Wu Chi-min, Lu Jing-xian, Zhao Pei-ying (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.5-12 (Jan. 1983). In Chinese.
Using an analytic expression for valence quark distribution function of hadron in the leading logarithm approximation, the authors discuss the QCD behaviour for the valence quark distribution function of pions. The existing data are explained excellently. They also predict the differential cross section M^3 $(d\sigma)/(dM)$ for massive lepton pair production with the Drell-Yan mechanism and compare it with data. (25 refs.)

65124 Quantum chromodynamics predictions in renormalization scheme-independent perturbation theory. A.Dhar, V.Gupta (Tata Inst. of Fundamental Res., Bombay, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.4
It has been shown recently that any physical quantity R is determined implicitly as a function of only renormalization scheme invariants, ρ_0, ρ_1, ρ_2,....., to all orders for a massless field theory with a single coupling constant. Quantum chromodynamics predictions to two-loop order, within this scheme independent approach, are discussed for various quarkonia decays, e^+e^- annilation into hadrons and deep-inelastic scattering processes.

65125 Electromagnetic quark mass difference and dynamical symmetry breaking. H.S.Mani, J.P.Singh (Dept. of Phys., Indian Inst. of Technol., Kanpur, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.6
By considering the effect of QCD feedback on electromagnetic self-energy, the authors analyse up and down quark mass difference taken as the difference of electromagnetic self-energies, in a dynamically broken chiral-invariant QCD. They find that this does not remove the wrong sign of $(m_u$-$m_d)$ for any reasonable value of momenta.

65126 Masses and decay widths of some exotic particles and their implications. G.Bhamathi (Dept. of Theoretial Phys., Univ. of Madras, Madras, India), K.Prama.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.8
Studies on Glueballs and multiquark states have been recently intensified with the identification of the i(1440) and $\theta(1640)$ as possible candidates for glueballs. It has also been recognised that in this context hybrid or hermaphrodite states, involving quarks antiquarks and gluons, may be indistinguishable from genuine glueball and other states. Masses and decay widths of some exotic particles will be reported and their implications on the possible distinction between various types of exotic particles will be discussed.

65127 Heavy quarkonium systems in cut-off potential model. L.Chatterjee (High Energy Phys. Div., Jadavpur Univ., Calcutta, India), S.Bhattacharyya.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.9
A cut-off type approximation for the funnel potential for Quarkonium systems is used to calculate c and b quark masses by solution of the Schrodinger equation. Perturbations of the oscillator levels due to inclusion of the (I/r) term are estimated.

65128 Couplings of heavy flavour particles from QCD sum rules. C.P.Singh, S.N.Ram (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.10
The authors calculate hadronic coupling constants of heavy flavoured particles in QCD by extrapolating from the asymptotic freedom regime using QCD sum rules. They discuss the relevance in the dynamics of SU(4) or SU(5) flavour symmetry breaking.

65129 Which is lighter—d or u quark?. S.Chakrabarty (Dept. of Phys., Visva-Bharati Univ., Santiniketan, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.12
The occurance of quarks in doublets in quantum flavour dynamics leads to the guess that probably the d quark is lighter than the u. The author applies potential models to study the bound states of a quark and an antiquark and find that only those potentials for which the mass of a bound state increases with increase in the mass of a constituent, allow both coloumb and confining potentials, and in this case the d quark must be heavier than the u quark. On the other hand, there are power law potentials which suggest that the d quark may be lighter than the u.

65130 Nuclei as metabags. K.Babu Joseph, V.G.Sreevalsa (Dept. of Phys., Univ. of Cochin, Cochin, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.14
An attempt is made to extend the MIT bag model of hadrons to nuclei. The authors consider the nucleus to be a metabag consisting of 3q clusters called minibags which can come in the singlet or octet representation of $SU(3)_c$. A universal mixing between the color singlet and color octet configurations is postulated in constructing a zero order bag model wave function for the nucleus. The introduction of a one-gluon-exchange phenomenological interaction between different 3q clusters leads to an interacting system of nucleons as well as a non-interacting one, the former being identified as the true nuclear configuration. Using the MIT bag hamiltonian for the unperturbed part, the masses of several nuclear species are calculated.

65131 Breakdown of Bloch-Nordsieck conjecture in the fourth order of perturbation for $q\bar{q}\rightarrow\gamma^*$. H.Banerjee, A.Chatterjee, M.Sengupta (Saha Inst. of Nuclear Phys., Calcutta, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.24
The Block-Nordsieck (B-N) theorem states that, in a given order of perturbation of a semi-inclusive cross-section in QED infrared divergence (IRD) due to virtual photons cancel with those due to experimentally unobserved soft photon emission in the final state. Recently some authors have made the important discovery that the B-N mechanism of IRD cancellation between real and virtual gluons breaks down in perturbative QCD with massive quarks. The authors have examined the question of breakdown of the B-N mechanism in the process $q\bar{q}\rightarrow\gamma^*+$soft gluons.

12.35H Phenomenological composite models of particle structure and reactions (partons, bags, etc.)

65132 Spin-dependent hyperfine interactions in the positive-parity nonstrange excited baryons. B.F.Tynemouth (Phys. Dept., Univ. of Edinburgh, Edinburgh, Scotland).
J. Phys. G (GB), vol.9, no.5, p.a497-509 (May 1983).
The author uses the nonrelativistic harmonic-oscillator quark model as a basis in which to study the effects of including, in a consistent manner, all the spin-dependent hyperfine interactions which arise from the nonrelativistic reduction of one-gluon exchange and confinement, in the calculation of the masses of the nonstrange baryons commonly assigned to the second excited level. The results are in good qualitative agreement with present experimental data. (18 refs.)

65133 Deformed solutions of the MIT quark bag model. D.Vasak, R.Shanker, B.Muller, W.Greiner (Inst. fur Theoretische Phys., Johann Wolfgang Goethe-Univ., Frankfurt am Main, Germany).
J. Phys. G (GB), vol.9, no.5, p.511-20 (May 1983).
The authors have solved the quark confinement boundary-value problem of the MIT bag model numerically for axially deformed bag shapes. As first results they present a Nilsson-type level diagram for quarks confined in a deformed cavity. Minimising the baryon energy with respect to the shape parameters, they also calculate the masses of baryonic states. Here the results show very clearly that excited baryon resonances are intrinsically deformed. (20 refs.)

65134 Spectroscopy of charmed baryons. T.Morii (Dept. of Phys., Univ. of Wuppertal, Wuppertal, Germany), M.Kaburagi, M.Kawaguchi, T.Kitazoe, M.Tomita, J.Morishita, M.Oka.
Z. Phys. C (Germany), vol.17, no.3, p.219-27 (1983).
An atomlike baryon composed of one heavy quark and two light quarks is studied in a similar way to the Breit theory of a helium atom. Spectroscopy of charmed baryons is given for the vector Coulomb plus scalar linear confining potential. (13 refs.)

65135 The pressure ensemble as a tool for describing the hadron—quark phase transition. R.Hagedorn (CERN, Geneva, Switzerland).
Z. Phys. C (Germany), vol.17, no.3, p.265-81 (1983).
The author applies the technique of Gaussian regularization to the grand canonical pressure partition function to show that under physically meaningful boundary conditions (nonexistence of external confining vessels, i.e. no fixed volumes) the energy density and similar intensive quantities have, in a statistical bootstrap model of extended hadrons (Van der Waals type volume corrections), indeed the singularity claimed. Earlier results obtained with an entirely different technique (which had been criticized) are recovered and shown to be correct. The technique used here is useful in all cases where the volume is not imposed from the outside, but results from the internal dynamics of the system as is generally the case in high energy physics and astrophysics. (14 refs.)

65136 Masses and some electromagnetic properties of charm and b-quark hadrons in a bag model with a variable bag pressure. P.K.Chatley (Dept. of Phys., Panjab Univ., Chandigarh, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.11
The author investigates how a new bag phenomenology with a variable bag pressure as its main ingredient is successful in reproducing various properties of heavy hadrons. The results for masses, magnetic moments, and M1 radiative decay widths indicate that these properties arise in a natural and consistent manner from the theory.

65137 Decay of glue balls to a pair of mesons. K.Biswal, S.P.Misra (Inst. of Phys., Bhubaneswar, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.13
It is at present widely believed on the basis of the MIT bag model that we may have colour singlet hadrons as two gluon bound states. The authors discuss here specific decay modes of such two gluon bound states to pairs of mesons. They notice that there is a possible dynamical mechanism which will enhance the probability of decay to channels with less phase space rather than to channels with more phase space.

12.70 HADRON MASS FORMULAS

65138 Elementary particles as mass eigenstates of quantum-relativistic particles. M.Banai, B.Lukacs (Central Res. Inst. for Phys., Budapest, Hungary).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.16, p.533-8 (16 April 1983).
The authors propose an approach to classically (c) relativistic quantum (q) theory. It seems quite natural to suppose that there exists some connection between the mass m and the wave function $\phi(x)$. Thus it is assumed that eigenvalue equations $\hat{m}\phi = m\phi$ are valid for q objects (particles) of state space $L^2(R^3)$. In this simple approximation they obtain that the corresponding cq particles (mesons) lie along linear Regge trajectories. This approach reproduces in a simple way the main aspects and results of the relativistic harmonic-oscillator quark models. They present an expression for the discrete spectrum of the q particle $(\text{mass})^2$ states. (19 refs.)

65139 Monte Carlo simulation of radiative corrections to the processes $e^+e^- \to \mu^+\mu^-$ and $e^+e^- \to \bar{q}q$ in the Z_0 region. F.A.Berends, R.Kleiss (Inst. Lorentz, Leiden, Netherlands), S.Jadach.
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.185-200 (April 1983).
Radiative corrections to a process are experiment dependent. A Monte Carlo simulation of both $\mu^+\mu^-$ and $\mu^+\mu^-\gamma$ events is ideally suited for imposing any experimental cuts. (2 refs.)

65140 Radiative corrections to Higgs production by $e^+e^- \to ZH$ in the Weinberg-Salam model. J.Fleischer, F.Jegerlehner (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.469-92 (2 May 1983).
Presents a complete analysis of the one-loop radiative corrections to the associated production of a Higgs boson (H) and a neutral vector boson (Z) in e^+e^- annihilation up to energies and Higgs-boson masses of 1 TeV. In the region of interest for future experiments $E \lesssim 200$ GeV ($m_H \lesssim 100$ GeV) the authors find corrections of $+25\%$ which are essentially cancelled by soft-photon effects. The latter amount to -31% for an electron counter resolution of 0.1. (26 refs.)

65141 Production of a pseudoscalar meson with a lepton-antilepton pair in e^+e^- collisions. T.Miyazaki, Y.Ishizaki, K.Kuniyoshi (Dept. of Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.217-36 (21 March 1983).
The production of a pseudoscalar meson with an e^+e^- or $\mu^+\mu^-$ pair is studied in a model-independent way. At a certain configuration of the produced e^+e^-, it especially becomes large and the process is not only important to search for a new particle which can decay into two photons, but also in that it gives a considerable QED background to other experiments of e^+e^- pair production. (9 refs.)

65142 Electroweak effects in $e^+e^- \to \mu^+\mu^-$ at 29 GeV. E.Fernandez, W.T.Ford, A.L.Read,Jr., J.G.Smith (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), A.Marini, I.Peruzzi, M.Piccolo, F.Ronga, H.T.Blume, R.Weinstein, L.Baksay, H.R.Band, W.L.Faissler, M.W.Gettner, G.P.Goderre, B.Gottschalk, R.B.Hurst, O.A.Meyer, J.H.Moromisato, W.D.Shambroom, E.von Goeler, J.V.Allaby, W.W.Ash, G.B.Chadwick, S.H.Clearwater, R.W.Coombes, Y.Goldschmidt-Clermont, H.S.Kaye, K.H.Lau, R.E.Leedy, H.L.Lynch, R.L.Messner, S.J.Michalowski, K.Rich, D.M.Ritson, L.J.Rosenberg, D.E.Wiser, R.W.Zdarko, D.E.Groom, Hoyun Lee, E.C.Loh, M.C.Delfino, B.K.Heltsley, J.R.Johnson, T.L.Lavine, T.Maruyama, R.Prepost.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1238-41 (25 April 1983).
A measurement of the cross section for production of collinear muon pairs based upon a sample of about 3000 events observed in the MAC detector at the storage ring PEP is presented. From the angular asymmetry $A_{\mu\mu} = 0.076 \pm 0.018$ the axial-vector weak neutral coupling is found to be given by $g_A{}^e g_A{}^\mu = 0.31 \pm 0.08$. (9 refs.)

Effect of triple gluon coupling in semi-inclusive polarized scattering processes .... See Entry 65156

13.15 NEUTRINO INTERACTIONS

(inc. interactions involving cosmic rays)

65143 Measurement of the polarization of positive muons produced in high-energy antineutrino interactions. M.Jonker, F.Udo (Nikhef, Amsterdam, Netherlands), J.V.Allaby, U.Amaldi, G.Barbiellini, A.Capone, W.Flegel, M.Metcalf, J.Meyer, F.L.Navarria, J.Panman, A.M.Wetherell, K.Winter, F.W.Busser, H.Daumann, P.D.Gall, E.Metx, F.Niebergall, K.H.Ranitzsch, P.Stahelin, E.Grigoriev, V.Kaftanov, V.Khovansky, A.Rosanov, A.Baroncelli, B.Borgia, C.Bosio, F.Ferroni, E.Longo, P.Monacelli, F.de Notaristefani, P.Pistilli, C.Santoni, V.Valente.
Z. Phys. C (Germany), vol.17, no.3, p.211-17 (1983).
The question whether scalar-type interations contribute to weak interactions at large momentum transfer has been investigatied by a measurement of the longitudinal polarization of positive muons produced in charged-current interactions of high-energy antineutrinos with iron. At an average momentum transfer $\langle Q^2 \rangle = 4$ GeV^2 the muon spin is found to be oriented forward with respect to the muon momentum vector, with an average polarization of 1.10 ± 0.24, consistent with positive helicity. A limit on scalar contributions of $\sigma_{s,p}/\sigma_{tot} < 7\%$ at the 95% confidence level can be deduced. A search for violation of time reversal invariance which could manifest itself by a polarization component perpendicular to the muon production plane gave a limit of $\sigma_{tv}/\sigma_{tot} < 16\%$ (95% CL). It is concluded that the weak leptonic charged current retains its dominant vector and axial vector structure at large momentum transfers. (23 refs.)

65144 Neutrino and antineutrino charged-current inclusive scattering in iron in the energy range $20 < E_\nu < 300$ GeV. H.Abramowicz, J.G.H.de Groot, J.Knobloch, J.May, P.Palazzi, A.Para, F.Ranjard, A.Savoy-Navarro, D.Schlatter, J.Steinberger, H.Taureg, W.von Ruden, H.Wahl, J.Wotschack (CERN, Geneva, Switzerland), P.Buchholz, F.Eisele, H.P.Klasen, K.Kleinknecht, H.Lierl, D.Pollmann, B.Pszola, B.Renk, H.J.Willutzki, F.Dydak, T.Flottmann, C.Geweniger, J.Krolikowski, K.Tittel, P.Bloch, B.Devaux, C.Guyot, J.P.Merlo, B.Peyaud, J.Rander, J.Rothberg, R.Turlay, J.T.He, T.Z.Ruan, W.M.Wu.
Z. Phys. C (Germany), vol.17, no.4, p.283-307 (1983).
Inclusive charged-current interactions of high-energy neutrinos and antineutrinos have been studied with high statistics in a counter experiment at the CERN Super Proton Synchrotron. The energy dependence of the total cross-sections, the longitudinal structure function, and the nucleon structure functions F_2, xF_3, and $\bar{q}^{\bar{\nu}}$ are determined from these data. The analysis of the Q^2-dependence of the structure functions is used to test quantum chromodynamics, to determine the scale parameter Λ and the gluon distribution in the nucleon. (30 refs.)

Charm fragmentation function−a comparison of neutrino and e^+e^- data .... See Entry 65160

13.20 LEPTONIC AND SEMILEPTONIC DECAYS OF MESONS

65145 The estimates of the vector and pseudoscalar decay constants. S.N.Banerjee, A.K.Sarker (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Phys. Scr. (Sweden), vol.27, no.3, p.163-5 (March 1983).
Using an improved version of the Van Royen-Weisskopf formula, the leptonic decay widths, decay constants of ψ, Υ and pseudoscalar particles have been computed in the statistical model. The calculated results are found to compare favourably with the experimental findings and other theoretical estimates. (9 refs.)

Decay processes in the massive straton model of mesons .... See Entry 65147

13.25 HADRONIC DECAYS OF MESONS

65146 Einstein locality and the $K^0\bar{K}^0$ system. F.Selleri (Istituto di Fisica, Univ. di Bari, Bari, Italy).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.16, p.521-6 (16 April 1983).
By applying Einstein locality to the $J^{PC} = 1^{--}$ state of two neutral kaons the authors obtain for correlated observations of two K^0 interactions a rate 12% lower than predicted by quantum mechanics. (4 refs.)

65147 Decay processes in the massive straton model of mesons. Ding Yi-bing (Graduate School, Univ. of Sci. & Technol. of China, China), Chao Kuang-ta.
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.28-34 (Jan. 1983). In Chinese.
Using the B-S wave functions of mesons in the massive straton model, the authors discuss their weak decay, electromagnetic decay, and particularly hadronic decay processes. Not only are $f_\pi \approx f_K$ and the $1^- \to 1^+1^-$ rate successfully explained, but also the predicted widths for various hadronic decays are in good agreement with experimental data. (14 refs.)

65148 Experimental upper limits for hadronic and axion decays of the Υ(1S). B.Niczyporuk, Z.Jakubowski, T.Zeludziewicz (Inst. of Nuclear Phys., Cracow, Poland), G.Folger, B.Lurz, H.Vogel, U.Volland, H.Wegener, J.K.Bienlein, R.Graumann, H.-J.Trost, M.Schmitz, F.H.Heimlich, R.Nerst, A.Schwarz, U.Strohbusch, P.Zschorsch, K.W.Chen, A.C.Konig, D.J.Schotanus, M.Coles, A.Engler, R.W.Kraemer, D.Marlow, F.Messing, C.Rippich, S.Youssef, A.Fridman, G.Alexander, A.Av-Shalom, G.Bella, J.Grunhaus, W.Langguth, M.Scheer.
Z. Phys. C (Germany), vol.17, no.3, p.197-202 (1983).
A search for the decays $\Upsilon \to \rho\pi$, $\Upsilon \to J/\psi X$ and $\Upsilon \to \gamma a$(where X is undetermined and a is an axion) has been completed using the LENA detector at the DORIS storage ring. No evidence for any of these processes was found. For these decay modes the authors set branching fraction upper limits (90% CL) of 2.1×10^{-3}, 2.0×10^{-2} and 9.1×10^{-4}, respectively. (29 refs.)

13.30 DECAYS OF BARYONS

65149 On extracting weak quark couplings from bottom and top decays. I.I.Bigi, H.G.Evertz (Inst. fur Theoretische Phys., RWTH Aachen, Aachen, Germany).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.2, p.359-72 (2 May 1983).
The authors list and discuss the various types of systematic uncertainties one faces when extracting quark mixing angles from the decays of bottom and top hadrons. Evaluating various suggested methods they conclude that a study of

the lepton energy spectrum in B and T decays provides a reasonable way of obtaining the ratio of mixing angles; yet analysis of just the endpoint region will not lead to a reliable determination. Such results should be backed up by other studies based on very energetic kaons and on the mode $B^- \rightarrow \tau^- \bar{\nu}_\tau$. A dedicated effort should be made to search for flavour changing neutral currents in channels like B, $T \rightarrow \tau^+ \tau^- X$. (11 refs.)

65150 Neutrino backgrounds in the Kolar Gold Field nucleon decay experiment. M.R.Krishnaswamy, M.G.K.Menon, N.K.Mondal, V.S.Narasimham, B.V.Sreekantan (Tata Inst. of Fundamental Res., Bombay, India), Y.Hayashi, N.Ito, S.Kawakami, S.Miyake.
Pramana (India), vol.19, no.6, p.525-54 (Dec. 1982). [received: April 1983]
The neutrino events recorded in the Kolar Gold Field nucleon decay detector are analysed. It is shown that there is good agreement between the observations and the estimates based on the intensities of atmospheric neutrinos and interaction cross-sections of neutrinos available from accelerator experiments. In the context of the search for proton decay, the authors show that the low energy (<2 GeV) neutrino events, which would provide the main background, are suppressed at the KGF site since it is situated near geomagnetic equator, where the geomagnetic cut-off rigidities are high. A comparison of the predicted characteristics of ν-induced events with the KGF observations shows that, within the statistical accuracy of the present data, the signal due to nucleon decay stands out distinctly within the ν-induced background. (34 refs.)

13.40F Electromagnetic form factors; electric and magnetic moments

65151 Pion and kaon form factors in the statistical model. S.N.Banerjee, R.K.Das (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Can. J. Phys. (Canada), vol.61, no.4, p.532-4 (April 1983).
The pion and kaon form factors have been studied in the context of the statistical model and the size of the meson is found to have a sensitive dependence upon the form of the form factor in the model. (8 refs.)

65152 The axial form factor of the nucleon and the pion-nucleon vertex function. P.A.M.Guichon, G.A.Miller, A.W.Thomas (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.109-12 (21 April 1983).
The axial form factor of the nucleon in the Cloudy Bag Model is harder than the $NN\pi$ vertex function, and consistent with data for a bag radius about 1 fm. The authors examine how these results are altered by excluding the pion field from a smaller, interior volume. (19 refs.)

65153 Moments of definite signature in lepton-hadron scattering and their right signature points. S.Koretune (Dept. of Phys., Fukui Medical School, Fukui, Japan).
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.113-16 (21 April 1983).
It is shown that the distinction between the structure function defined by the current commutator and the one defined by the current anticommutator is important when one derives moment sum rules in lepton-hadron scattering. By taking this fact into consideration, the author defines moments of definite signature and continue them analytically in the complex n plane where signature is the concept which we met in analytical continuation in angular momentum. Then the author shows that the missing integers in the classical derivation of the moment sum rules in QCD become the right signature points of the ones given by the structure function defined by the current anticommutator. This fact proves conjectures as to analytical continuation of the anomalous dimension proposed by Ross and Sachrajda, (1978). (8 refs.)

65154 Compton scattering: test of the double differential cross section in the relativistic impulse approximation. A.Reineking, R.Wenskus, A.Baumann, D.Schaupp, P.Rullhusen, F.Smend, M.Schumacher (Phys. Inst., Univ. Gottingen, Gottingen, Germany).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.29-31 (11 April 1983).
Cross sections $d^2\sigma/d\Omega dE_{\gamma 2}$ for bound Compton scattering are calculated in the relativistic impulse approximation using DHFS wave functions. Agreement is observed with experiment for $E_{\gamma 1}=279$ and 662 keV at the peak of the profiles. Discrepancies found at the high-energy side are only partly explained by second-order S-matrix calculations. (16 refs.)

65155 Differential cross sections of proton Compton scattering at photon laboratory energies between 1.2 and 1.7 GeV. J.Duda, F.-W.Hofner, M.Jung, R.Kleissler, H.Kuck, P.Leu, K.-D.deMarne, B.Munk, W.Vogl, R.Wedemeyer (Phys. Inst., Univ. Bonn, Bonn, Germany).
Z. Phys. C (Germany), vol.17, no.4, p.319-23 (1983).
Differential cross sections of proton Compton scattering have been measured at the Bonn 2.5 GeV synchrotron. The experiment covers photon laboratory energies between 1.2 GeV and 1.7 GeV and the square of the four-momentum transfer ranges from $t=-0.17$ GeV^2 to -0.98 GeV^2 corresponding to c.m. scattering angles between 35° and 80°. The cross sections exhibit a forward peak followed by a continuous fall-off up to the largest measured $|t|$-values. Fits of the form $d\sigma/dt = A.\exp(Bt)$ to the data points with $|t| \leq 0.5$ GeV^2 yield forward cross sections A, which are consistent with the 0^0 cross sections calculated from the measured total photon-proton cross section. The average slope is $B=5.6\pm0.14$ GeV^2. (13 refs.)

65156 Effect of triple gluon coupling in semi-inclusive polarized scattering processes. E.N.Argyres (Phys. Dept., State Univ. of New York, Coll. of Arts & Sci., Plattsburgh, NY, USA), C.S.Lam, Bing-an Li.
Z. Phys. C (Germany), vol.17, no.4, p.335-40 (1983).
Show that the gluon helicity inside a proton and a photon can be deduced from a knowledge of a special combination of cross sections of the semi-inclusive processes $e+p \rightarrow e+\pi+\pi+\ldots$ and $e^+ + e^- \rightarrow e^+ + e^- + \pi + \pi + \ldots$. Such a measurement could thus be used to check the QCD prediction that the gluon helicity increases linearly with $\ln Q^2$. (7 refs.)

13.60K Meson production

65157 On the ambiguity of estimates of the isotopic multipole amplitudes for the pion photoproduction on protons. V.F.Grushin, E.M.Leikin, A.Ya.Rotvain, A.A.Shikanyan.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.33-5 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.38-40 (1982).
Discusses a method for removing the continuous nonuniqueness of solutions of the isotopic multipole analysis of photoproduction on protons which does not require the use of the data on the phase of πN scattering, or to postulate the magnitude of any amplitude. (3 refs.)

13.65 HADRON PRODUCTION BY ELECTRON-POSITRON COLLISIONS

65158 Study of the ω meson in the VEPP-2M storage ring. A.M.Kurdadze, E.V.Pakhtusova, V.A.Sidorov, A.G.Chilingarov, Yu.V.Shatunov, B.A.Shvarts, S.I.Eidel'man (Inst. of Nuclear Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.274-6 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.221-3 (20 Sept. 1982). [received: April 1983]
The reaction $e^+e^- \rightarrow \pi^+\pi^-\pi^0$ has been studied at c.m. energies from 760 to 800 MeV in the VEPP-2M storage ring. The following parameters were found for the ω resonance: $M_\omega=782.2\pm0.4$ MeV, $\Gamma_\omega=9.8\pm0.9$ MeV, $\sigma_{max}(\omega \rightarrow \pi^+\pi^-\pi^0)=1.39\pm0.10$ μb, and $\Gamma(\omega \rightarrow e^+e^-)=0.63\pm0.05$ keV. (10 refs.)

65159 Baryon production in e^+e^-. B.Klima (Dept. of Phys. & Astron., Tel Aviv Univ., Ramat Aviv, Israel).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.209-16 (21 March 1983).
Presents a simple classical model for baryon production in e^+e^- interactions. Its predictions can be checked precisely at the threshold for heavy-flavour production. The author expects a relative step of about 10% in $\Delta R(p+\bar{p})$ and in $\Delta R(\Lambda+\bar{\Lambda})$ near the $\Lambda_b\bar{\Lambda}_b$ threshold (at about 11 GeV). If the t-quark exists, the author predicts a larger step in $\Delta R(\Lambda+\bar{\Lambda})$ of about 50% when passing the $\Lambda_t^+\Lambda_t^-$ threshold. (12 refs.)

65160 Charm fragmentation function—a comparison of neutrino and e^+e^- data. K.Kleinknecht, B.Renk (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Z. Phys. C (Germany), vol.17, no.4, p.325-8 (1983).
Experimental data on the fragmentation of charmed quarks produced in neutrino and e^+e^- reactions are compared. The resulting hard fragmentation functions agree mutually. They are parametrized in two ways suggested by kinematical considerations. (17 refs.)

65161 Angular distribution of two observed hadrons in electron-position annihilation. D.E.Soper (Inst. of Theoretical Sci., Univ. of Oregon, Eugene, OR, USA).
Z. Phys. C (Germany), vol.17, no.4, p.367-9 (1983).
Discusses the angular structure of the cross section for $e^+ + e^- \rightarrow A+B+X$ and the closely related energy-energy correlation function. (6 refs.)

65162 Dibaryon resonances. A.B.Wicklund (Argonne Nat. Lab., Argonne, IL, USA).
AIP Conf. Proc. (USA), no.95, p.168-80 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Phase shift analyses of pp elastic scattering indicate resonance-like loops in several partial waves, which could be attributed to exotic 6-quark resonances or simply to inelastic threshold effects. Differences between theoretical predictions and experimental spin wave analyses are available in these channels. The nucleon-nucleon dibaryon candidates are coupled predominantly to the $NN\pi$ channels, and theoretical interpretation of these effects will require detailed understanding of the $NN\rightarrow\Delta N$ reaction. (68 refs.)

65163 Partial wave analysis of $pp-)\pi d$, πd elastic and pp elastic in the dibaryon region. N.Hiroshige, W.Watari (Res. Inst. for Atomic Energy, Osaka City Univ., Osaka, Japan), M.Yonezawa.
AIP Conf. Proc. (USA), no.95, p.181-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Results of a partial wave analysis of $p+p-)\pi+d$ reaction and $\pi+d$ elastic scattering are presented. The authors also give preliminary results on the pole structure in the $^1D_2$ state by the three channel K-matrix analysis. (14 refs.)

65164 Nucleon nucleon scattering experiments at SATURNE II. F.Lehar (CENS, Gif-sur-Yvette, France).
AIP Conf. Proc. (USA), no.95, p.187-92 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Using a proton polarized beam from SATURNE II and the Saclay frozen spin target the spin correlation parameter A_{oonn} and the total cross section difference $\Delta\sigma_T$ were measured. Including these preliminary data a phase shift analysis has been made. A possible structure in the pp spin singlet state near the mass 2.22 Gev is observed. (7 refs.)

65165 $p\uparrow p\uparrow$ scattering at SIN. E.Aprile-Giboni, G.Cantale, R.Hausammann, E.Heer, R.Hess, C.Lechanoine-LeLuc, W.R.Leo, S.Morenzoni, Y.Onel, D.Rapin (Univ. of Geneva, Geneva, Switzerland), S.Mango.
AIP Conf. Proc. (USA), no.95, p.193-8 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Using the PM1 polarized proton beam at SIN and a polarized target, the elastic $p\uparrow p\uparrow$ scattering as well as the inelastic channel $p\uparrow p\uparrow\rightarrow\pi^+d$ have been studied between 400 and 600 MeV. For the elastic reaction, a sufficient number of spin dependent parameters has been measured in order to do a direct reconstruction of the scattering matrix between 38° cm and 90° cm. (10 refs.)

65166 Spin parameter measurements in p-p elastic scattering at 6 and 11.75 GeV/c. R.G.Wagner (Argonne Nat. Lab., Argonne, IL, USA).
AIP Conf. Proc. (USA), no.95, p.210-16 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Results of recent analyses of two ZGS experiments at 6 and 11.75 GeV/c are presented. At 6 GeV/c the double scattering parameters K_{LS}, K_{NN}, D_{SS}, H_{LSN}, and H_{NSS} were measured as part of a program to determine the p-p elastic scattering amplitudes. Approximate values for the amplitudes are given. Preliminary data for C_{SS} and C_{LS} at 11.75 GeV/c are given and features of the data are compared with previous measurements of C_{NN}. The combined C_{SS} and C_{NN} data allow a determination of $\Delta\sigma_T{}^{el}$. (11 refs.)

65167 Proton-proton elastic amplitudes at several GeV. S.Wakaizumi (Hiroshima Univ., Hiroshima, Japan).
AIP Conf. Proc. (USA), no.95, p.217-22 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Proton-proton elastic scattering is analyzed at 6 and 12 GeV/c in the eikonal representation for scattering amplitudes by the use of the data on cross-sections and various spin-observables. The spin-dependent eikonals such as spin-spin and tensor couplings have turned out to have three components; long-range part, medium-range part and short-range part. The long-range force seems to be caused by the one-pion-exchange force from its range, sign and magnitude. The medium-range force is similar to the heavy-boson-exchange one. The short-range force has a range of 0.3-0.5 fm and a strength of 100-200 MeV, which may come from the quark hard scattering in QCD. The scattering amplitudes are obtained at both energies and their behavior is discussed. They have a strong and smooth energy-dependence. (10 refs.)

65168 Recent data in p-p elastic scattering and diproton resonances. A.Yokosawa (Argonne Nat. Lab., Argonne, IL, USA).
AIP Conf. Proc. (USA), no.95, p.223-5 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Presents data on spin-spin correlation parameters $C_{LL}=(L,L,;O,O)$ and $C_{SL}=(S,L;O,O)$ up to 2.47 GeV/c incident momentum in proton-proton elastic scattering. These data will be useful in clarifying ambiguities in phase-shift analyses, and in confirming diproton resonances. (11 refs.)

65169 Nucleon-nucleon experiments at LAMPF. M.W.McNaughton (Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.95, p.243-5 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Nine major groups (in various collaborations) are involved with the continuing program of nucleon-nucleon measurements of LAMPF. The author summarizes the $pp\rightarrow pp$ data. In general, these data are in good agreement with Arndt's phase shift representation. No new neutron data have been obtained since that reported at the 1980 Santa Fe Conference, but a program of $np\rightarrow np$ spin correlation experiments is scheduled for 1983. The major effort in the proton beam lines will be in $\vec{p}\vec{p}\rightarrow pp$ at small angles (UCLA), and pp inelastic measurements. (6 refs.)

65170 Measurement of polarization parameters in pp elastic scattering and direct experimental reconstruction of the elastic scattering matrix at 445 MeV. E.Aprile, R.Hausamann, E.Heer, R.Hess, C.Lechanoine-LeLuc, W.Leo, S.Morenzoni, Y.Onel, D.Rapin (Univ. de Geneve, Geneve, Switzerland), S.Mango.
AIP Conf. Proc. (USA), no.95, p.246-8 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
These measurements are part of a series in progress at SIN with the objective of determining the nucleon-nucleon amplitudes in p-p elastic scattering between 400-600 MeV from a complete experiment. The authors have measured 15 observables at 8 angles between 62°-90° CM and 11 observables at 6 angles between 38°-58°CM. These observables include the polarization, the two-spin polarization transfer and three spin tensors and the two-spin correlation parameters. (4 refs.)

65171 $d\sigma/d\Omega$ and a_y for small angle pp elastic scattering at 1.46 GeV/c. G.Pauletta, G.Adams, S.M.Haji-Saeid, G.Igo, J.B.McClelland, A.Rahbar, A.T.M.Wang, C.A.Whitten,Jr., A.Wriekat (Univ. of California, Los Angeles, CA, USA), M.M.Gazzaly, N.Tanaka.
AIP Conf. Proc. (USA), no.95, p.249-51 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The measurement of pp elastic scattering observables in the Coulomb-nuclear interference region is an effective means of unravelling the various components of the pp scattering amplitude. Coulomb-nuclear interference terms make the phases of the nuclear components accessible. Small angle measurements may be sensitive to possible dibaryon resonances. It was pointed out by Hoshizaki (1978) that a calculation of the energy dependence of a $\rho=\mathrm{Re}[M_{1N}+M_{3N}]/\mathrm{Im}[M_{1N}+M_{3N}]$ (M_{iN}, i=1-5, are nuclear parts of the helicity amplitudes) near 800 MeV may show characteristics of resonance structure. By measuring the spin-averaged differential cross section $\sigma(\theta)$ in the Coulomb-nuclear interference region, ρ may be determined. The authors present results on both $\sigma(\theta)$ and analysing powers $A_y(\theta)$. The measurements were extended into $\theta_{lab}=0.5°$ and permitted both e M_{5N} and Im M_{5N} to be determined. (14 refs.)

65172 Spin-spin asymmetries in large angle proton-proton elastic scattering. M.Anselmino (Dept. of Phys., Westfield Coll., London, England).
AIP Conf. Proc. (USA), no.95, p.342-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
In the framework of the models describing p-p large angle elastic scattering in terms of quark-quark scattering, the author presents a simple possible explanation of the most striking spin effect. The author discusses the differences between this approach and others. (6 refs.)

65173 $^1S_0$-state nucleon-nucleon phase shifts due to solitary-wave exchange potentials. M.Sebhatu (Dept. of Chem. & Phys., Winthrop Coll., Rock Hill, SC, USA).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.16, p.513-18 (16 April 1983).
$^1S_0$-state proton-proton and neutron-proton phase shifts calculated using $\lambda\Phi^4$ and sine-Gordon solitary-wave exchange potentials (SWEPs) are compared with the phase shifts obtained by Arndt et al. and Bugg et al (1978) from recent world nucleon-nucleon scattering data. The SWEPs, utilizing only one more parameter than the basic Yukawa potential, reproduce the phenomenological phase shifts up to 500 MeV remarkably well. (17 refs.)

65174 A quark reaarrangement model with spatial overlapping function for low energy $N\bar{N}$ annihilation. M.Maruyama, T.Ueda (Dept. of Appl. Math., Osaka Univ., Osaka, Japan).
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.121-6 (21 April 1983).
The major part of the branching ratios for the $N\bar{N}$ annihilation at rest is explained by the quark rearrangement in the N and $\bar{N}$ into three SU(6) mesons. This is shown by using the spin, isospin, and spatial overlap function derived theoretically from quark dynamics. (12 refs.)

65175 Inclusive γ-produnction in $\bar{p}p$ interactions at 0.76 and 2.0 GeV/c. S.Banerjee, S.Chakrabarti, S.N.Ganguli, A.Gurtu, P.K.Malhotra, R.Raghavan, A.Subramanian, K.Sudhakar (Tata Inst. of Fundamental Res., Bombay, India).
Z. Phys. C (Germany), vol.17, no.3, p.203-10 (1983).
The inclusive production of photons in $\bar{p}p$ interactions has been studied at incident momenta of 0.76 and 2.0 GeV/c. The inclusive cross sections for γ-production and the average multiplicities of γ, $\langle n_y\rangle$, are presented as a function of the charged prong topology. Results on the two particle correlation parameters f^{00} and f^{-0} are presented. The inclusive distributions of the Feynman variable x and of the transverse momentum p_T of the photons are compared with the expectations from charged pion distributions on the basis of charge independence. A search has been made for direct γ-production in $\bar{p}p$ interactions at 0.76 GeV/c by looking for events which fit uniquely the hypothesis $\bar{p}p\rightarrow m\pi^+ + m\pi^- + \gamma$. (11 refs.)

65176 Direct photon production beyond leading log aproximation-$-q+q\rightarrow\gamma+q+q$ contribution. M.Nowk, M.Praszalowicz (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Z. Phys. C (Germany), vol.17, no.3, p.249-57 (1983).
The $q+q\rightarrow\gamma+q+q$ contribution (for incoming quarks of equal and different flavors) to the next-to-leading correction for the direct photon production in pp collisions is calculated, analyzed in terms of double moments and compared with the data. The dimensional regularization method is used and the final state Bremsstrahlung infinities are regularized by an angular cut-off. The correction is found to be 30-40% of the Born contribution providing a better description of the data. (20 refs.)

13.75G Pion-baryon interactions (energy ≤ 10 GeV)

65177 Baryon spectroscopy at LAMPF. B.M.K.Nefkens (Phys. Dept., Univ. of California, Los Angeles, CA, USA).
AIP Conf. Proc. (USA), no.95, p.205-9 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Pion-nucleon elastic scattering at intermediate energy provides a classic example of the importance of spin to the study of strong interactions. An extensive program to determine accurately the πN scattering amplitudes from $p_\pi=247$ to 687 MeV/c is currently carried out at LAMPF by the UCLA Particle Physics Research Group. The author discusses the status of the UCLA program. (10 refs.)

65178 The ωn cusp in π^-p elastic differential cross-section. R.Bhandari (Phys. Dept., New Mexico State Univ., Las Cruces, NM, USA).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.16, p.527-32 (16 April 1983).
The effect of the opening of the ωn channel on the π^-p elastic differential cross-section is investigated. It is shown that, despite the ωn's large production rate, the 10 MeV width of ω is large enough to smear the cusp and render it unobservable as a dramatic effect in the π^-p elastic differential cross-section. This is in sharp contrast to a prominent cusp observed at the ηn threshold. (no refs.)

65179 Remarks on the $\phi\phi$ enhancement observed in $\pi^-p\to\phi\phi n$. S.Minami (Dept. of Phys., Osaka City Univ., Osaka, Japan).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.551-4 (23 April 1983).
It is pointed out that the observed $\phi\phi$ enhancement around 2.2 GeV has something to do with a tensor meson belonging to the Regge trajectory which degenerates with the $\phi'(1680)$ trajectory. (10 refs.)

13.75J Kaon-baryon interactions (energy $\leq$ 10 GeV)

65180 K, π, p scatterings from polarized deuteron at KEK. A.Masaike (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
AIP Conf. Proc. (USA), no.95, p.199-204 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Presents experimental results of the polarization measurement of K^+n elastic and charge exchange scatterings, and the pn elastic scattering at the momenta between 1.06~1.82 GeV/c, using a spin frozen deuteron target. Present status of the measurement of the vector polarization of K^+d and π^+d elastic scattering at KEK is also described. (14 refs.)

65181 Progress report on a study of inelastic K^- reactions with polarized target in the Brookhaven MPS. J.Button-Shafer (Univ. of Massachusetts, Amherst, MA, USA).
AIP Conf. Proc. (USA), no.95, p.226-7 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The University of Massachusetts full-scale polarized-target run with the Brookhaven MPS was successfully carried out in late 1980, many years after being proposed. This study of K^- inelastic processes represents the first application of the 'spin refrigerator' target, and is unusual among polarized-target exeriments in its use of a large multiparticle spectrometer for complex final states. It is also unusual in its emphasis on inelastic channels of $S=-1$ baryon resonances. Analysis of data (at 2.3 GeV c.m.) now in progress will establish the usefulness of the target system and also provide new information for the $SU(6)_W$ (or other) quark model. (3 refs.)

65182 Interference correlations between like pions in the reaction $K^-p\to K^-p\pi^+\pi^+\pi^-\pi^-$ at 8.25 GeV/c. H.Rosaki-Mavrouli, A.Apostolakis, P.Michaelides (Nuclear Phys. Lab., Univ. of Athens, Athens, Greece), J.R.Fry, H.Muirhead, M.Markytan, H.Rohringer, S.Karpathopoulos, M.Mermikides, E.Simopoulou.
Z. Phys. C (Germany), vol.17, no.3, p.189-96 (1983).
The authors have observed correlations in the transverse momentum of pion pairs with like and unlike charge produced in 8.25 GeV/c $K^-p\to K^-p\pi^+\pi^+\pi^-\pi^-$ interaction. They found that a Bose-Einstein interference effect accounts partially for these correlations. Evidence is presented indicating that the correlations observed in the above reaction can be described by the reflections from the occurrence of physical resonances. (14 refs.)

65183 A partial wave analysis of the f' region in the reaction $K^-p\to K\bar{K}\Lambda^0$ at 8.25 GeV/c. M.Baubillier (LPNHE, Univ. of Paris VI, Paris, France), I.J.Bloodworth, A.Burns, J.N.Carney, G.F.Cox, U.Dore, J.B.Kinson, K.Knudson, F.Levy, P.J.Negus, B.Y.Oh, E.Quercigh, J.M.Scarr, G.A.Smith, O.Villalobos Baillie, M.F.Votruba, J.Whitemore, R.Zitoun.
Z. Phys. C (Germany), vol.17, no.4, p.309-17 (1983).
A partial wave analysis of the $K\bar{K}$ system produced by 8.25 GeV/c K^- mesons in the reaction $K^-p\to K\bar{K}\Lambda^0$ has been performed, taking into account the information provided by the Λ^0 decay. The f' region is dominated by $D_0^{(-)}$ and $D_1^{(+)}$ waves. The authors see no evidence for the production of new O^{++} states in the mass region 1.05 to 1.75 GeV. (6 refs.)

65184 Spin asymmetries in W and Z production at pp and $\bar{p}p$ colliders. J.Lindfors (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).
AIP Conf. Proc. (USA), no.95, p.259-67 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The $SU(2)\times U(1)$ electroweak theory predicts large spin asymmetries in the production of W and Z by polarized hadron beams. In the leptonic decays of W and Z polarized beams could be used to test the coupling of the standard model as well as to study the polarization properties of quarks and gluons. In the hadronic decays of W and Z polarized beams provide a way to extract the weak interaction signal from the dominating QCD background. (13 refs.)

65185 Multiplicity distributions in proton-neutron interactions at 400 GeV/c. D.K.Bhattacharjee, S.K.Ray, P.Sarkar, T.Roy (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Can. J. Phys. (Canada), vol.61, no.4, p.523-31 (April 1983).
Presents a study on the charged multiplicity distribution in proton-neutron (PN) interactions at 400 GeV/c from the data on an exposure of a Fermilab 30-in. deuterium bubble chamber to 400 GeV/c protons. The pn and pp distributions were extracted through an empirical model to correct for double scattering in deuterium. The overall average fraction of the double scattered event is 0.128 ± 0.011. The resulting pn and pp multiplicity distributions give average multiplicities of 8.48 ± 0.10 and 8.99 ± 0.12 respectively. The fraction of pd events which occur off the neutron is 0.52 ± 0.02. The extracted pp distribution parameters are compared with those from the hydrogen bubble chamber (HBC) experiments. Distinctive features of extracted pn distribution are discussed. (18 refs.)

65186 On the transverse momentum of slow protons, deuterons, and pions in high energy interactions. J.B.Singh (Dept. of Phys., Panjab Univ., Chandigarh, India).
Can. J. Phys. (Canada), vol.61, no.4, p.543-9 (April 1983).
A detailed analysis of transverse momentum spectra of slow protons, deuterons, and pions produced in proton emulsion interactions at 400 GeV and π^-C interactions at 40 GeV has been made. Various statistical parameters have been used to test the different forms of the transverse momentum distributions. The nature of the p_T distributions of all the particles is similar in π^--A and p-A interactions at both the energies. (19 refs.)

65187 Measurement of forward and backward mean charged-particle multiplicities in high-energy (pp) soft interactions and comparison with high-energy neutrino and antineutrino deep inelastic scattering. G.Bonvicini, G.Cara Romeo, L.Cifarelli, A.Contin, M.Curatolo, G.D'Ali, C.Del Papa, B.Esposito, P.Giusti, T.Massam, R.Nania, G.Sartorelli, G.Susinno, L.Votano, A.Zichichi (CERN, Geneva, Switzerland).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.555-9 (23 April 1983).
The difference between forward and backward mean charged-particle multiplicities is shown to exist also in (pp) interactions when these are analysed in analogy with the deep inelastic scattering method. The measurements reported here show that this difference, which has been observed for a long time in (νp) and ($\bar{\nu}$p) deep inelastic scattering experiments, is explained in terms of the omitted correction for the leading effect in the backward hemisphere. (24 refs.)

65188 Evidence for the same two-particle correlations in rapidity space in (pp) collisions and (e^+e^-) annihilation. J.Berbieres, G.Bonvicini, G.Cara Romeo, L.Cifarelli, A.Contin, M.Curatolo, G.D'Ali, C.Del Papa, B.Esposito, P.Giusti, T.Massam, R..Nania, G.Natale, F.Palmonari, G.Sartorelli, G.Susinno, L.Votano, A.Zichichi (CERN, Geneva, Switzerland).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.563-8 (23 April 1983).
Evidence is reported for the same two-particle correlations in rapidity space in soft, high-energy (pp) collisions and (e^+e^-) and (e^+e^-) annihilation when the leading baryons' effects are taken into account. (24 refs.)

65189 Fire string model for the large transverse momentum production of lepton pairs in proton-proton collision. P.Catorina (Deipartimento di Fisica, Univ. Bair, Bari, Italy), L.Merola, F.Visco.
Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.117-20 (21 April 1983).
The Fire-String model, which reproduces, without perturbative QCD gluons, all the experimental data about the structure of hadronic final states in e^+e^- annihilation and in hadron-hadron inclusive scattering, is successfully applied to the production of high transverse of high transverse momentum lepton pairs in proton-proton collisions at ISR energies. (11 refs.)

65190 Muon-pair formation in the collision of polarized hadrons. M.P.Rekalo (Kharkov Physicotech. Inst., Acad. of Sci., Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.7, p.663-6 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.88-91 (July 1982). [received: May 1983]
The angular dependence of the differential cross section of muon-pair production in hadron-hadron collisions $a_1+a_2\to\mu^++\mu^-+X$, is investigated in general form, attention being directed mainly toward those contributions to the differential cross section which are determined by the vector polarization of the incident hadron a_1. The specific mechanism of processes $a_1+a_2\to\mu^++\mu^-+X$ is not given in detail, but use is made of such general properties as the conservation of electromagnetic hadron current and the invariance of the electromagnetic interaction of hadrons with respect to spatial reflections. (10 refs.)

65191 Quark recombination in deuteron fragmentation. P.Pal (Uluberia Coll., Howrah, West Bengal, India), P.Dasgupta, N.Dasgupta.
Z. Phys. C (Germany), vol.17, no.3, p.243-8 (1983).
Low-P_T production off deuteron in the fragmentation region is studied on the basis of a six-quark picture of deuteron. It is argued that all six valence quarks participate equally in the hadronization processes associated with meon and baryon productions. The x-distribution of the inclusive cross sections is studied in the framework of a quark recombination model. Fit with experimental data leads to a determination of the valence and sea quark distributions in deuteron. Probabilistic arguments applied to a general recombination picture are shown to lead to some experimentally verifiable constraints on baryon multiplicities. Possibilities of determining the various recombination probabilities are also discussed. (11 refs.)

65192 Prospects of technicolor-signatures in hadronic collisions. K.Grassie (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Z. Phys. C (Germany), vol.17, no.4, p.353-64 (1983).
Within the context of the Dimopoulos' (1980) one family model, the author considers possible technicolor signatures in hadronic reactions at high energies. For the single-production of light color-singlet states (P^0, P^3, $P^\pm$) in $p\bar{p}$ annihilation, the author finds the Compton-scattering process $gc\to P^0c$ most promising. In case of PGB-pair-production, the reaction $p\bar{p}\to P^+P^-$ via the subprocess $q\bar{q}\xrightarrow{\gamma,Z0}P^+P^-$, as well as the production of heavy color-triplets (P_3) in $p\bar{p}\to P_3\bar{P}_3$ via $q\bar{q}$ and gg-fusion at Tevatron-energies, appear to be best suited for detecting these objects. (31 refs.)

65193 Evidence for the t- quark in $\bar{p}p$ collider data. V.Barger, A.D.Martin, R.J.N.Phillips.
Report RL-83-015, Rutherford Appleton Lab., Chilton, Oxon., England (Feb. 1983), 13 pp.
Proposes a simple method to identify semileptonic weak decays $t\to e\nu b$ of any heavy particle t and to determine its mass independent of the t-production mechanism, using $\bar{p}p$ collider events that contain a single electron (or muon) and missing transverse momentum. Events with transverse mass $M_T(e\nu) > 3$ GeV originate either from t-decays of mass $m_t > M_T(e\nu)+m_b$ or from $W\to e\nu$ decays; the latter is a distinctive background that can be subtracted. The $M_T(e\nu)$ distribution of electron events with jets, recently observed in the

UA1 experiment at CERN, may be interpreted as being due to a t-quark with mass 25 to 40 GeV. (7 refs.)

65194 Finding the t- quark in W boson decay debris. V.Barger, A.D.Martin, R.J.N.Phillips.
Report RL-83-016, Rutherford Appleton Lab., Chilton, Oxon., England (Feb. 1983), 13 pp.
Points out a spectacular jet plus electron signature of t-quark production at $\bar{p}p$ colliders via W boson decay $W \to tb$ with subsequent $b \to$ jet, and $t \to be\nu$ decays. The b jet momentum transverse to the beam has a Jacobian peak near $p_T(b)=(M_W^2-m_t^2)/(2M_W)$; this jet is expected to be highly collimated. Electrons from t-decay occur with large momentum components normal to the b jet in the plane transverse to the beam. Both the b Jacobian peak and transverse momenta of the t-decay fragments can be used in making further determinations of m_t. (7 refs.)

65195 Polarization and inclusive reactions: an introduction for the theory workshop [spin physics]. K.Heller (Univ. of Minnesota, Mineapolis, MN, USA).
AIP Conf. Proc. (USA), no.95, p.320-2 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). (16 refs.)

65196 Single spin asymmetry for Drell-Yan dileptons and the chromo-Coulomb phase: a new test of QCD. J.P.Ralston (High Energy Phys. Div., Argonne Nat. Lab., Argonne, IL, USA), B.Pire.
AIP Conf. Proc. (USA), no.95, p.329-34 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors discuss the angular distribution $d\sigma/d^4Qd\Omega$ of dileptons produced in collisions in which one hadron is polarized and the other unpolarized. They find that single-spin dependent contributions at measured Q_T are non-zero when imaginary parts from higher order loop graphs are considered, but vanish in the absence of such initial state interactions. They report on a complete calculation in progress in perturbative QCD at $O(\alpha_s^2)$ of the dominant structure function coming from the $q\bar{q} \to \gamma^* + X$ channel. They consider the exponentiation of this result and point out that this would lead to an oscillatory scaling violation. (10 refs.)

65197 Spin asymmetries in large P_T production of lepton pairs in the collision of polarized hadrons. K.Hidaka (Tokyo Gakugei Univ., Tokyo, Japan).
AIP Conf. Proc. (USA), no.95, p.337-41 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The author makes predictions for spin asymmetries in the production of lepton pairs at large p_T from the collision of longitudinally polarized hadrons using QCD and the electroweak gauge model. Asymmetries typically at the 10% level are predicted. The experimental test should be possible in the near future, e.g., at ISABELLE. (12 refs.)

13.90 OTHER TOPICS IN SPECIFIC REACTIONS AND PHENOMENOLOGY OF ELEMENTARY PARTICLES

65198 Perpendicular $e\nu$ mass from W decay. V.Barger, A.D.Martin, R.J.N.Phillips.
Report RL-83-011, Rutherford Appleton Lab., Chilton, Oxon., England (Jan. 1983), 9 pp.
The authors point out properties of the 'perpendicular $e\nu$ mass', defined in terms of transverse momenta $\vec{p}_T$ by $M_T^2(e\nu)=2|\vec{p}_{eT}||\vec{p}_{\nu T}|-2\vec{p}_{eT}\cdot\vec{p}_{\nu T}$, that make it particularly well suited to W mass and width determinations. They give an analytic expression for its distribution in W production and subsequent $W \to e\nu$ decay at $\bar{p}p$ colliders, accurate to order $\langle p_{WT}^2/M_W^2\rangle \approx 1\%$. A maximum likelihood fit of this formula to the five UA1 events gives $M_W=80.3\pm_3^6$ GeV. (6 refs.)

14.80 OTHER AND HYPOTHETICAL PARTICLES

65199 Spectroscopic search for fractional charge in ultrapure semiconductors. M.J.H.van de Steeg, H.W.H.M.Jongbloets, P.Wyder (Res. Inst. for Materials, Univ. of Nijmegen, Nijmegen, Netherlands).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1234-7 (25 April 1983).
A search for fractional-charge impurities in semiconductors, using photothermal ionization spectroscopy, is described. It is shown that, depending on the concentration of compensating impurities, the detection sensitivity for fractional-charge impurities in ultrapure germanium is 10^7 cm^{-3} in a conventional configuration and, after modification 10^5 cm^{-3}—i.e. one fractional charge per 10^{19} nucleons. From measured spectra of an ultrapure Ge sample it was deduced that it contained less than 1.5×10^{11} cm^{-3} acceptorlike fractional-charge impurities. (16 refs.)

20.00 NUCLEAR PHYSICS

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

65200 Quenching of the mass operator associated with collective states in many-body systems. P.F.Bortignon, R.A.Broglia (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), C.H.Dasso.
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.221-34 (25 April 1983).
Giant resonances are understood as superposition of particle-hole excitations. The empirical systematics indicates that the associated spreading widths are considerably smaller than the sum of typical widths of single-particle and single-hole states, and that the centroid energy is in good agreement with the RPA predictions. These results imply a destructive interference between the different contributions to the mass operator associated with collective vibrations. The authors study the properties of the mechanism responsible for this quenching by inspecting contributions to the mass operator in the semiclassical limit of large single-particle angular momenta. (16 refs.)

65201 High-spin rotational bands and pairing reduction in ^{166}Hf. Y.K.Agarwal, J.Recht, H.Hubel, M.Guttormsen (Inst. fur Strahlen- und Kernphys., Univ. Bonn, Bonn, Germany), D.J.Decman, H.Kluge, K.H.Maier, J.Dudek, W.Nazarewicz.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.199-210 (9 May 1983).
Rotational properties of the ^{166}Hf nucleus have been studied by in-beam spectroscopic methods using the ^{150}Sm(^{20}Ne,4n)^{166}Hf reaction. The ground band was observed up to the $I^\pi = 18^+$ level, the s-band from the $I^\pi = 12^+$ up to $I^\pi = 22^+$ level; in addition two side bands were found. The results are interpreted in terms of the pairing-self-consistent Hartree-Fock-Bogolyubov cranking model. Quantitative agreement between theory and experiment is obtained for the crossing of the ground band and s-band. The calculations predict a reduction of about 50% in the neutron pairing energy gap of yrast states in the crossing region. The kinematical ($\mathcal{J}^{(1)}$) and dynamical ($\mathcal{J}^{(2)}$) moments of inertia are analysed. (10 refs.)

65202 Rotation-alignment effect in ^{198}Hg in an angular-momentum-projected band-mixing calculation. C.R.Praharaj (Inst. of Phys., Bhubaneswar, India), S.B.Khadkikar.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1254-7 (25 April 1983).
The crossing of the ground and the S band and the interaction between these two in ^{198}Hg are studied for states of sharp angular momenta by projection from deformed intrinsic states and subsequent diagonalization. The S band crosses the ground band producing backbend around 8ħ, in agreement with experiment. The spectra as well as the rotation alignment of $i13/2$ neutrons are presented. (14 refs.)

65203 Medium-spin levels in ^{137}Ce and the prolate-oblate shape transition in Ce nuclei. M.Kortelahti, T.Komppa, M.Piiparinen, A.Pakkanen, R.Komu (Dept. of Phys., Univ. of Jyvaskyla, Jyvaskyla, Finland).
Phys. Scr. (Sweden), vol.27, no.3, p.166-8 (March 1983).
The level structure of the $N=79$ ^{137}Ce nucleus has been studied with the ^{137}Ba(^{3}He,3n) reaction using in beam γ-ray and conversion electron spectroscopoy. The level ordering in the $\nu h_{11/2}{}^{-1} \times 2^+$ multiplet has been discussed on the basis of the triaxial rotor-plus-particle model which suggests a slightly oblate triaxial shape for ^{137}Ce and the prolate-oblate shape transitions in the Ce isotopes to occur between $N=77$ and 79. (15 refs.)

21.10D Binding energy and masses

65204 The mass of ^{18}N. G.D.Putt, L.K.Fifield, M.A.C.Hotchkis, T.R.Ophel, D.C.Weisser (Dept. of Nuclear Phys., Australian Nat. Univ., Canberra, Australia).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.190-8 (9 May 1983).
States in ^{18}N have been populated with the ^{18}O(^{7}Li,^{7}Be)^{18}N reaction at 52 MeV. The single ground-state peak observed in previous measurements using charge-exchange reactions is shown to be at least a doublet, which leads to a substantial revision of the ground-state mass of ^{18}N. The revised value of the mass excess is 13.116 ± 0.020 MeV. Several excited states of ^{18}N are also observed. (4 refs.)

65205 Accurate determination of the ^{17}O-^{16}O+n coupling constant and spectroscopic factor. S.Burzynski, M.Baumgartner, H.P.Gubler, J.Jourdan, H.O.Meyer, G.R.Plattner, H.W.Roser, I.Sick (Dept. of Phys., Univ. of Basel, Basel, Switzerland), K.-H.Mobius.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.230-40 (9 May 1983).
The authors have measured ^{16}O-^{17}O elastic cross sections at 22 MeV between 65°-140° to ±1%. The observed oscillatory interference between Coulomb scattering and the neutron transfer process is analyzed using exact finite-range DWBA. A model-independent value of $C^2=0.82\pm0.07$ is obtained for the coupling constant of the $1d_{5/2}$ neutron in ^{17}O. They also present an analysis of data on magnetic electron scattering from ^{17}O, which yields precise information on the magnitude and the radial shape of the $1d_{5/2}$ neutron bound-state wave function. With this they relate the coupling constant to the spectroscopic factor and find $S=1.06\pm0.11$. It is shown that the magnetic electron scattering data alone yield $S=1.04\pm0.10$. Combining these results with earlier work the authors recommend $C^2=0.79\pm0.04$ and $S=1.03\pm0.07$ as best values. This spectroscopic strength corresponds to (91±7)% of the full single-particle value. (19 refs.)

65206 A study on the binding problem of Δ(1232) in nuclei with the Hartree-Fock method. Shi Xiang-jun (Inst. of Atomic Energy, Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.76-85 (Jan. 1983). In Chinese.
The binding problem of isobar Δ(1232) in $_{\Delta}{}^{4}$He, $_{\Delta}{}^{12}$C and $_{\Delta}{}^{16}$O systems is studied in detail by the Hartree-Fock method. The OBEP is used for the nucleon-nucleon potential and the nucleon-Δ(1232) interaction. The calculated results show that Δ(1232) can be bound only in $_{\Delta}{}^{4}$He and not in the $_{\Delta}{}^{12}$C and $_{\Delta}{}^{16}$O systems. (9 refs.)

21.10F Shape, charge, radius and form factors

65207 Effect of spin on nuclear shape in deformed even nuclei in the framework of asymmetric rotor model. V.P.Varshney, K.K.Gupta, D.K.Gupta (Dept. of Phys., Arga Univ., Aligarh, India), A.K.Chaubey.
Indian J. Pure & Appl. Phys., vol.20, no.10, p.799-803 (Oct. 1982). [received: April 1983]
The existence of static triaxial shape has been investigated in the framework of the Davydov et al (1964) model. The assumption of rigid shape of the nucleus with fixed shape parameters β and γ proves to be satisfactory as an approximation to the actual nuclear wave functions up to spin 4. But at spin 6, the nucleus gets rid of its rigid shape, attains more freedom and the γ-vibrations begin to influence the shape of the nucleus. This fact implies appreciable dynamic triaxiality for most of the even nuclei at higher angular momentum and differs from viewpoint of RJ Turner and T Kishimoto [Nucl. Phys (Netherlands), 217 (1973) 317] about the abrupt phase transition of the rotational mode from axially symmetric to asymmetric shape at $I=8$. (23 refs.)

65208 Shell (deformation) effect in the nuclear charge radius. Zeng Jinyan, C.Y.Tseng (Dept. of Phys., Peking Univ., China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.101-8 (Jan. 1983). In Chinese.
It is shown that, without exception, the observed RMS charge radius constants of strongly deformed nuclei, $r_p's$, are a little larger than those of the neighbouring spherical nuclei. The local variations among the charge radii of the sequence of isotopes, the incomplete neutron shells [$1p_{3/2}(N\sim3\text{-}6)$, $1d_{5/2}$, $(N\sim9\text{-}14)$, $1f_{7/2}(N\sim20\text{-}28)$, $1g_{9/2}(N\sim40\text{-}50)$, $1h_{11/2}$, $(N\sim70\text{-}82)$], display some peculiar behaviors (e.g. RMS charge radii decrease with increasing A) which are sharply conflicting with the traditional $A^{1/3}$-law. Taking the deformation effect into account, these strange variations can be accounted for with $Z^{1/3}$-law. (36 refs.)

65209 D-wave asymptotic normalization constants for the ^{3}H and ^{3}He systems. J.J.Bevelacqua (USDOE, Oak Ridge, TN, USA).
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.203-16 (Feb. 1983).
Trinucleon wave functions, based on the generalized R-matrix methodology of Lane and Robson (1966, 1969), have been previously shown to provide representative binding energies, charge radii, and S-wave asymptotic normalization constants for the ^{3}H and ^{3}He systems. Herein, R-matrix predictions of D-wave asymptotic normalization constants, asymptotic normalization constant ratios, and D-wave parameters are calculated in order to more fully evaluate the adequacy of model wave functions. The R-matrix calculations generally reproduce the ranges of the data and suggest that model trinucleon wave functions are representative of the ^{3}H and ^{3}He systems and will be useful in studies of (d,^{3}H), (d,^{3}H), and other transfer reactions involving ^{3}He or ^{3}He. (43 refs.)

65210 Magnetic form factor of ^{49}Ti at high momentum transfer. T.Suzuki (Dept. of Phys., Nihon Univ., Tokyo, Japan).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.262 vol.2
Effects of core polarization and mesonic exchange currents are investigated in the magnetic form factor of ^{49}Ti(e,e)^{49}Ti at high momentum transfer region: $q_{eff}\gtrsim2$ fm^{-1}. (4 refs.)

21.10J Spectroscopic factors

65211 (^{6}Li,d) reactions on ^{24}Mg and ^{26}Mg at 73 MeV. T.Tanabe, K.Haga, M.Yasue, K.Sato (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), K.Ogino, Y.Kadota, M.Tochi, K.Makino, T.Kitahara, T.Shiba.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.241-58 (9 May 1983).
The ^{24,26}Mg(^{6}Li,d)^{28,30}Si reactions have been studied at 73 MeV bombarding energy. The angular distributions were analyzed with exact finite-range distorted wave Born approximation calculations assuming a direct α-cluster transfer. Extracted spectroscopic strengths leading to low-lying levels of ^{28}Si and relative spectroscopic strengths between transitions to ^{28}Si and ^{30}Si ground states are consistent with those previously obtained by several α-transfer reactions. Many strongly populated levels have been observed at $E\gtrsim10$ MeV for ^{28}Si. A marked similarity was found between the deuteron spectrum and the ^{24}Mg(α,α)^{24}Mg excitation function in this excitation energy region. A brief comparison of the present α-transfer results with previous two-nucleon transfer data leading to ^{28,30}Si is also presented. (37 refs.)

21.10K Electromagnetic moments

65212 Nuclear magnetic moment of the 3.9 s $^{11}/_2{}^-$ isomer ^{193m}Au. E.Hagn, E.Zech (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.83-93 (9 May 1983).
The magnetic hyperfine splitting of ^{193m}Au ($J^\pi={}^{11}/_2{}^-$, $E=290$ keV; $T_{1/2}=3.9$ s) as a dilute impurity in Ni has been measured with nuclear magnetic resonance on oriented nuclei. With the known hyperfine field corrected for hyperfine anomalies the g-factor and magnetic moment of ^{193m}Au are deduced. (22 refs.)

65213 Magnetic moments in the backbending region of ^{158}Dy. G.Seiler-Clark, D.Pelte (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany), H.Emling, A.Balanda, H.Grein, E.Grosse, R.Kulessa, D.Schwalm, H.J.Wollersheim, M.Hass, G.J.Kumbartzki, K.-H.Speidel.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.211-29 (9 May 1983).
Yrast levels in the backbending region of ^{158}Dy were Coulomb excited with a 4.7 MeV/u ^{208}Pb beam. Employing the transient field technique with a thin magnetized iron foil, the precessions of the angular correlations of decay γ-rays from levels up to spin $I^{\pm}=16^+$ were measured. The results show a clear reduction of the g-factor for states in the backbending region relative to that of the low-spin levels, thus demonstrating that the backbending in ^{158}Dy is mainly caused by the alignment of $i_{13/2}$ neutrons. In a similar experiment, precession measurements on Coulomb excited low-spin levels of ^{164}Dy served to determine the static hyperfine field of Dy in Fe and the g-factor of the 6$^+$ state in ^{164}Dy. (22 refs.)

21.10M Level density and structure

65214 ^{9}Be+p elastic scattering at $2\leq E_p\leq5$ MeV and levels in ^{10}B. M.Allab, A.Boucenna, M.Haddad (Centre des Sci. et de la Technol. Nucleaires, Alger, Algeria).
J. Phys. (France), vol.44, no.5, p.579-88 (May 1983).
Absolute differential cross sections of the ^{9}Be+p elastic scattering have been measured between 2 and 3.8 MeV proton laboratory energy. Excitation curves at five angles between $\theta_{cm}=65°$ and 160°C and angular distributions at $E_p=2.31$, 2.44, 2.56, 2.62 and 2.73 MeV for $\theta_{cm}=40°$ to 140° have been obtained. These results together with the previous measurements at $E_p\leq5$ MeV have been compared with the calculations performed in the R-matrix formalism. A good fit has been achieved by introducing nine ^{10}B levels at the excitation energies $E_x=8.45$, 8.66, 8.78, 8.880, 8.892, 8.93, 10.00, 10.36 and 10.83 MeV. Resonance parameters for these levels have been deduced and compared with the existing values and, in some cases, with those of the analogous states in ^{10}Be. (33 refs.)

65215 Semiclassical calculation of one-particle, one-hole and two-particle,two- hole level densities. G.Ghosh, R.W.Hasse (Inst. Laue-Langevin, Grenoble, France), P.Schuck, J.Winter.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1250-3 (25 April 1983).
One-particle, one-hole and two-particle, two-hole level densities are calculated in the local-density, i.e., Thomas-Fermi, approach. For the harmonic oscillator this leads to analytical expressions which are in excellent agreement with the exact quantum results. (8 refs.)

21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

65216 A folded diagram method for deriving an energy-independent nucleon-nucleon potential from meson exchange. I. Theory. Li Guang-lie (Inst. of High Energy Phys., Acad. Sinica, Peking, China), K.K.Ng, T.T.S.Kuo.
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.67-75 (Jan. 1983). In Chinese.
A folded diagram method for deriving an energy-independent nucleon-nucleon (N-N) potential from meson exchange is proposed. The potential obtained by this method contains not only the irreducible diagrams but also the mesonic folded diagrams, and it is proved that all stretched diagrams are not contained in this potential. (12 refs.)

65217 Nucleon momentum widths in ^{10}B from projectile fragmentation at 32 MeV/u. R.K.Choudhury, M.N.Namboodiri, J.B.Natowitz, K.Hagel, L.Adler, P.Gonthier, H.Simon, S.Kniffen, R.Patton, E.Tomasi, C.Ngo, C.Mazur, M.Ribrag (Cyclotron Inst., Texas A&M Univ., College Station, TX, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.88
The authors have measured inclusive energy spectra of isotopes of all elements from H to B in the reactions of 32 MeV/u ^{10}B with ^{181}Ta. The forward angle spectra show a high energy component peaking at velocities slightly below the projectile velocity. This component can be characterized by a temperature of 1.7 to 2 MeV or alternatively, by a nucleon momentum width, σ_0-40 MeV/c. This value is comparable to the results of recent measurements for reactions at 20 MeV/u ^{20}Ne with ^{197}Au. In contrast, recent measurements on reactions with 43 MeV/u ^{20}Ne projectiles gave a temperature of 8 MeV (or σ_0-85 MeV/c) which is equal to the result obtained at relativistic energies. Thus, a rapid transition in temperature seems to occur between 32 and 43 MeV/u. (4 refs.)

65218 Is parametrization of particle-hole interaction by g′ good?. T.Suzuki (Dept. of Phys., Nihon Univ., Tokyo, Japan).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.263-4 vol.2
The author studies the validity of the parametrization of a particle-hole interaction by the Migdal parameter g′. Taking one-pion and one-rho meson exchange potential for the p-h interaction, $V(r)=(V_\pi(r)+V_\rho(r))g(r)$, where $g(r)$ is the short-range correlation function obtained from the Reid potential, he investigates if one can parametrize the short-range correlation and the exchange part of the matrix elements by a short-range $g'(\vec{\sigma}.\vec{\sigma})(\vec{\tau}.\vec{\tau})f^2/\mu^2 v_\pi(q)$ term; $v_\pi(q)=(1+q^2/\Lambda^2)^{-1}$. 21.60C Shell model

65219 Mutual support of magicities and residual effective interactions near ^{208}Pb. N.Zeldes, T.S.Dumitrescu, H.S.Kohler (Niels Bohr Inst., Copenhagen, Denmark).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.11-50 (9 May 1983).
The authors summarize experimental evidence in the lead region on the increased stability associated with neutron magic number when the proton number is magic, and vice versa. The effect is interpreted in the framework of the nuclear shell model with empirical effective interactions. Its relation to spherical Hartree-Fock calculations is pointed out and used to test Skyrme-type forces. None of the considered Skyrme interactions reproduce the effect. (38 refs.)

Shell (deformation) effect in the nuclear charge radius .... See Entry 65208

21.60E Collective models

65220 Intrinsic Lie group and nuclear collective rotation about intrinsic axes. Jin-Quan Chen, Fan Wang, Mei-Juan Gao (Dept. of Phys., Nanjing Univ., Nanjing, China).
J. Phys. A (GB), vol.16, no.7, p.1347-60 (11 May 1983).
For any Lie group G, is so called intrinsic Lie group $\bar{G}$ is introduced, G and $\bar{G}$ being commutative and anti-isomorphic. It is shown that in the parameter space of a Lie group G, the corresponding intrinsic Lie group $\bar{G}$ is just the second parameter group. The general relations between the first and second parameter groups are derived in a simple way. For the group SO(3), there is the intrinsic Lie group $\bar{S}\bar{O}(3)$. The infinitesimal generators of $\bar{S}\bar{O}(3)$ are precisely the components of the angular momentum in the intrinsic coordinate system. Therefore the intrinsic Lie group $\bar{S}\bar{O}(3)$ provides an appropriate mathematical formalism for the description of collective rotations of nuclei about their intrinsic axes. (37 refs.)

65221 Rotational limit of the interacting two-vector boson model. A.Georgieva, P.Raychev, R.Roussev (Inst. of Nuclear Res. & Nuclear Energy, Acad. of Sci., Sofia, Bulgaria).
J. Phys. G (GB), vol.9, no.5, p.521-34 (May 1983).
The rotational limit of the interacting two-vector-boson model is investigated. This limit arises if the Hamiltonian is ‘pseudospin’ invariant and corresponds to the following reduction chain of subgroups: $U(6)\supset U(3)\oplus U(2)\supset O(3)$. Analytic relations for the energies and E2 transition probabilities within the ground-state band, the β and γ vibrational bands and between the vibrational bands for the strongly deformed even-even nuclei are obtained. (19 refs.)

65222 g-boson excitations in the interacting boson model. K.Heyde, P.van Isacker, M.Warroquier, G.Wenes, Y.Gigase (Inst. for Nuclear Phys., Gent, Belgium), J.Stachel.
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.235-252 (25 April 1983).
The authors have extended the interacting boson model (IBM) by including the g-boson degree of freedom. Schematic model calculations have been carried out in the two different limits: SU(5) and O(6). Particular applications have been carried out for ^{104}Ru, a nucleus intermediate between SU(5) and O(6). In all cases, energy spectra, E2 and E4 transition rates have been studied in detail and compared with the most recent experimental data for ^{104}Ru. (33 refs.)

65223 Separation of variables in O(3)-invariant wave equations for quadrupole coordinates. A.V.Konarev (Inst. of Control Problems, Acad. of Sci., USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.655-9 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.80-3 (July 1982). [received: May 1983]
Linear, O(3) invariant equations for a multicomponent wave function, which depends on quadrupole coordinates, are examined. Vibrational, rotational, and spin parts in the Hamiltonian are separated, on which basis angular and internal variables are separated. (6 refs.)

65224 The $A=6$ isobaric triplet. G.Nagels (Dept. of Maths., Melbourne Univ., Melbourne, Victoria, Australia).
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.253-68 (25 April 1983).
A three-body model and phenomenological local potentials are used to study the $A=6$ isobaric triplet. The α-nucleon potential allows an unphysical bound s-state, the effects of which are removed by an orthogonality condition. A variational method is used, and trial functions are found which allow the analytic evaluation of all required integrals. A number of different phenomenological nucleon-nucleon potentials are used, and it is found that while the absolute energy levels are only approximately correct, the level splitting is very close to experimental values. 21.60G Cluster models

65225 Evidence for triton and alpha-particle clustering at high excitation in ^{15}N. A.A.Pilt (Tandem Accelerator Lab., McMaster Univ., Hamilton, Ontario, Canada).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.2, p.185-97 (21 March 1983).
The results of some recent experiments populating multiparticle-multihole states in ^{15}N are reinterpreted in the light of the cluster model. Many of the levels strongly excited in three- and four-nucleon transfer reactions are shown to be good candidates for ^{12}C+t and ^{11}B+α cluster states. The triton cluster structure in ^{15}N is similar to that in ^{19}F, indicating that clustering is stable over a wide mass range. Some mixing between triton and alpha cluster states may exist. 21.65 NUCLEAR MATTER

65226 Correlated basis theory of nucleon optical potential in nuclear matter. S.Fantoni, B.L.Friman, V.R.Pandharipande (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.51-65 (9 May 1983).
The authors give a brief and simple outline of correlated basis perturbation theory and use it to study the optical potential of nucleons in nuclear matter. The correlated basis functions (CBF) are generated with two-body correlation operators having central, spin, isospin, tensor and spin-orbit terms and realistic nuclear interactions are used to construct the Hamiltonian matrix. The zeroth-order term in the CBF perturbation expansion is given by the variational method, and there are no first-order contributions. The second-order CBF correction to the binding energy is calculated. The real and imaginary parts $U(\rho,e)$ and $W_0(\rho,e)$ of the energy-dependent nucleon optical potential in nuclear matter are calculated at the equilibrium density ρ_0 and at $\rho={}^1/_2\rho_0$. The second-order terms have a relatively small effect on $U(\rho,e)$, but they enhance the nucleon effective mass at $k=k_F$ from its variational values of $0.64m$ and $0.78m$ to $0.81m$ and $1.0m$ at $\rho=\rho_0$ and ${}^1/_2\rho_0$ respectively. The calculated U and W_0 are in fairly good agreement with empirical data. (31 refs.)

65227 Formation and signature of quark matter in relativistic ion collisions: evidence from cosmic rays. J.Cleymans, M.Dechantsreiter, F.Halzan (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA).
Z. Phys. C (Germany), vol.17, no.4, p.341-52 (1983).
Exclusively using experimental information on particle production in nucleon-nucleon interactions, the paper attempts to demonstrate that: (*i*) the characteristics of relativistic collisions between heavy nuclei are determined by quark physics, not conventional nuclear physics; (*ii*) the formation of quark matter in such collisions can be observed experimentally via large multiplicities, copious production of photons (not from π^0 decay), the anomalous strangeness, charm and baryon number structure of the events, and appearance of structure in the rapidity distribution; (*iii*) the formation of quark matter has actually been observed in high energy cosmic ray interactions. The authors show that the 100 TeV threshold for the appearance of anomalous interactions reflects the transition from nucleonic to quark structure of the nucleus. Observed anomalies match the signatures of quark matter formation in (ii); (*iv*) their results imply the abundant presence of heavy nuclei, e.g. Fe, in the high energy cosmic ray spectrum. Cosmic ray interactions above 100 TeV can eventually be used to study the vacuum structure of quantum chromodynamics and the disappearance of spontaneous symmetry breaking due to the restoration of symmetry at higher matter densities. (55 refs.)

21.80 HYPERNUCLEI

65228 Mass formulae for Λ-hypernuclei. K.Kar, J.C.Parikh (Phys. Res. Lab., Ahmedabad, India).
Pramana (India), vol.19, no.6, p.555-64 (Dec. 1982). [received: April 1983]
Simple considerations regarding the Hamiltonian and the ground state wavefunctions of Λ-hypernuclei are used to derive several mass formulae. The parameters that occur in the mass formulae are determined by fitting the experimental binding energies. Information regarding the various interactions in hypernuclei is deduced from the values of these parameters. The 'best' mass formula is further used to predict energies of other light hypernuclei. Relationships between binding energies are also suggested and checked with observed data. (12 refs.)

65229 The spectroscopy of a four-baryon system. Wang Wei-wei (Inst. of Theoretical Phys., Acad. Sinica, Peking, China), Zhang Yu-shun, Pan Ji-zhi, Wang Ru-ling.
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.109-13 (Jan. 1983). In Chinese.
Using $SU(6)$ symmetry theory, the four-baryon system is discussed and a method of analyzing experimental spectra is provided. As the ground states of ${}_{\Lambda\Lambda}{}^4$H, ${}_{\Lambda\Lambda}{}^4$He, ${}_{\Lambda}{}^4$H, ${}_{\Lambda}{}^4$He and ^{4}He are in the same IR of $SU(6)$, one can derive masses for ${}_{\Lambda\Lambda}{}^4$H and ${}_{\Lambda\Lambda}{}^4$He from the experimental data of ${}_{\Lambda}{}^4$H, ${}_{\Lambda}{}^4$He and ^{4}He. Calculations show that these $J^\pi=0^+$ double Λ hypernuclei ${}_{\Lambda\Lambda}{}^4$H and ${}_{\Lambda\Lambda}{}^4$He are not likely bound states. (12 refs.)

23.20 ELECTROMAGNETIC TRANSITIONS

65230 Investigation of parity violation in ^{19}F. K.Elsener, W.Gruebler, V.Konig, C.Schweizer, P.A.Schmelzbach, J.Ulbricht, F.Sperisen, M.Merdzan (Lab. fur Kernphys., EHT, Zurich, Switzerland).
AIP Conf. Proc. (USA), no.95, p.162-4 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The parity violating asymmetry A_γ of the radiation from the first excited state of polarized $^{19}F^*$(110 keV) has been measured with particular care to avoid systematical errors and is found to be $A_\gamma=(4.5\pm3.6).10^{-5}$. (8 refs.)

65231 Measurement of B(E2)↑ values of the $5/2_2^-$ states of ^{107,109}Ag from the Coulomb excitation with protons. M.B.Chatterjee (Saha Inst. of Nuclear Phys., Calcutta, India), B.B.Baliga, R.Bhattacharya.
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.2, p.65-72 (1983).
From the Coulomb excitation of natural silver with protons B(E2)↑ values were measured for the $5/2_2-$ states of ^{107,109}Ag using high resolution gamma-ray spectroscopy. B(E2)↑ values of all the observed states have been measured including the $5/2_2^-$ states. The observed and derived properties of the low-lying states of ^{107,109}Ag nuclei are tabulated. (17 refs.)

65232 Microscopic calculations in odd-odd nuclei. S.V.Moholkar, C.S.Warke (Tata Inst. of Fundamental Res., Bombay, India), M.R.Gunye.
J. Phys. G (GB), vol.9, no.5, p.535-43 (May 1983).
The energy spectra in the two even-parity bands $K^\pi=3$ and 4^+ and the two odd-parity bands $K^\pi=0^-$ and 1^- in the doubly-odd nucleus ^{168}Tm are studied in the framework of the microscopic method of variation after angular momentum projection with conservation of nucleon number in each projected state. The calculated energy spectra of the four bands in ^{168}Tm are in good agreement with the corresponding experimental data. (12 refs.)

65233 Unitary theory of the baryon-system. Wang Wei-wei (Inst. of Theoretical Phys., Acad. Sinica, Peking, China), Zhang Yu-shun, Li Yang-guo, Ruan Tu-nan.
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.57-66 (Jan. 1983). In Chinese.
A method of how to extend the baryon unitary theory to the baryon system is systematically introduced. Using the baryon-system $SU(6)$ theory, the spectroscopy of light nuclei and light Λ hypernuclei is discussed. When the Λ degree of freedom is frozen, this theory is in agreement with Wigner's supermultiplet theory. (21 refs.)

65234 Nuclear Gamow-Teller strength in the Δ(3,3)-region. H.Brunig, K.Klingenbeck (Inst. for Theoretical Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.76
Single charge exchange reactions like (p,n) or (^{3}He,t) are particularly suited tools to investigate Gamow-Teller transitions in complex nuclei, both at low and at intermediate energies. In the proper range of energy transfer the Δ(3,3) resonance dominates the nuclear excitation pattern. The influence of the ΔN-interaction on the nuclear excitation spectrum, in particular the occurrence of collective multipole excitations, has been studied in the framework of the Isobar-Doorway (A^*,Δ-hole) model which has already been applied successfully to pion-, photo- and electro-induced reactions in the Δ(3,3) region. It turns out that the ΔN-dynamics significantly modify the multipole spectrum of a complex nucleus compared to a simple quasifree picture. Qualitatively similar effects are expected to show up in the nuclear response function for charge exchange reactions. This is demonstrated for the sample of the inclusive (^{3}He,t) reaction on ^{12}C which has recently been studied at SATURNE for various incident energies. (3 refs.)

65235 Excitation of continuum states in heavy-ion collisions. H.Lenske, S.Landowne, H.H.Wolter, T.Udagawa (Sektion Phys., Univ. Munchen, Garching, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.77
Recently direct reaction theory has been applied to light- and heavy-ion reactions leading to continuum states. The authors use this approach to study inelastic collisions involving light heavy ions where polarizations have been measured. The double differential cross sections are calculated in this approach as the sum of one- and two-step cross sections. $^{48}T_2(^{16}O,^{16}O^1)$ is used as an example. (2 refs.)

23.20C Lifetimes and transition probabilities

65236 Search of the chemical change of the ^{119m}Sn ($T_{1/2}$=293 days) radioactive decay rate. K.Makariunas, E.Makariuniene, A.Dragunas (Inst. of Phys., Acad. of Sci., Vilnius, Lithuanian SSR).
Hyperfine Interactions (Netherlands), vol.13, no.4, p.237-48 (Feb. 1983).
The differences in decay rates of the nuclear isomer ^{119m}Sn ($T_{1/2}$=293 days; the strongly converted M4 transition) have been measured for different chemical compounds. The experimental results show that the ^{119m}Sn nuclei in the telluride SnTe decay faster then in the metal β-Sn and in the dioxide SnO_2 [the relative change $\Delta\lambda/\lambda$ of the decay probability λ is $+(3.6\pm1.4)\times10^{-4}$]. No measurable difference between the decay rates of ^{119m}Sn in β-Sn and SnO_2 has been observed [$(\Delta\lambda/\lambda)=-(0.1\pm1.2)\times10^{-4}$], irrespective of the great difference in electronic structure of the tin atoms. The results cannot be explained by considering the internal conversion of the valence electrons only. It is necessary to assume that the chemical changes of the decay rate are strongly influenced by the chemical changes of the probabilities of the internal conversion of electrons of the inner shells of the atom. This conclusion is confirmed by theoretical calculations. They show that for the deep inner subshells the relative changes $\Delta\alpha_{nlj}/\alpha_{nlj}$ of the internal conversion coefficients α_{nlj} are much greater than the relative changes $\Delta\rho_{nlj}/\rho_{nlj}$ of the electron densities near the nucleus ρ_{nlj}. (22 refs.)

65237 Half-life measurements of excited levels in ^{157,159,161}Er. V.Berg, J.Oms (Inst. de Phys. Nucleaire, Orsay, France), M.C.Abreu, K.Fransson, Hu Zhaomin.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.119-30 (9 May 1983).
Half-lives of several low-lying levels in ^{157,159,161}Er have been measured using isotopically separated sources of Tm produced by the ISOCELE facility at Orsay, France. Delayed coincidences between internal conversion electrons or between conversion electrons and gamma quanta have been registered. Absolute reduced transition probabilities of γ-transitions have been deduced and compared with single-particle estimates and theoretical values found from model calculations including the Coriolis mixing of states. 23.40 BETA DECAY; ELECTRON AND MUON CAPTURE

65238 **The decay of ^{100}Ag.** S.Rastikerdar, C.Garrett, G.S.Foote, W.Gelletly (Schuster Lab., Univ. of Manchester, Manchester, England).
J. Phys. G (GB), vol.9, no.5, p.555-72 (May 1983).
The gamma rays emitted in the decay of sources of ^{100}Ag produced in the ^{102}Pd(p,3n) and ^{92}Mo(^{12}C,p3n) reactions have been studied in singles and coincidence. Comparison of the measured relative intensities of gamma rays from sources produced in the two reactions confirms the existence of two beta-decaying isomers in ^{100}Ag with spins and parities 5^+ and $3^{(+)}$. Decay schemes for the two isomers were constructed on the basis of gamma-gamma coincidences. The half-life of ^{100}Ag was found to be 2.06 ± 0.25 min and no difference was found in the half-lives of the two isomers. The decay energy was determined to be 7.17 ± 0.25 MeV from studies of positron-gamma-ray coincidences. Measurements of log *ft* values and gamma-gamma angular correlations allowed the assignment of spins and parities to levels in ^{100}Pb. (32 refs.)

65239 **The beta decay of ^{137}Cs.** H.Behrens (Fachinformationszentrum Energie, Phys., Math., Karlsruhe, Germany), P.Christmas.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.131-40 (9 May 1983).
Evidence is presented to support the view that the approximate shape factor $C=q^2+bp^2$ does not adequately describe the second-forbidden beta decay of ^{137}Cs. An improved formula is given, with single-particle estimates of the nuclear matrix-element ratios. According to this model the coefficient of p^2 involves considerable cancellation between matrix elements; when due allowance is made for this, good fits to the experimental data are obtained, leading to better estimates of the decay scheme parameters. (22 refs.)

65240 **Decay studies of neutron-rich products from ^{76}Ge induced multinucleon transfer reactions including the new isotopes ^{62}Mn, ^{63}Fe and ^{71,72,73}Cu.** E.Runte, W.-D.Schmidt-Ott, P.Tidemand-Petersson (Phys. Inst., Univ. Gottingen, Gottingen, Germany), R.Kirchner, O.Klepper, W.Kurcewicz, E.Roeckl, N.Kaffrell, P.Peuser, K.Rykaczewski, M.Bernas, P.Dessagne, M.Langevin.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.163-80 (9 May 1983).
By irradiating a ^{nat}W target with 9 MeV/u ^{76}Ge ions, neutron-rich isotopes in the chromium-germanium region were produced. On-line mass-separated samples were investigated. The new isotopes ^{62}Mn, ^{71}Cu, ^{72}Cu and ^{73}Cu were identified and their half-lives measured as 0.88(15), 19.5(16), 6.6(1) and 3.9(3) s, respectively. The half-life of ^{63}Fe, a nucleus which has previously been detected using particle-identification techniques, was measured as 4.9(5) s. Decay schemes were derived in most cases. Additional spectroscopic information was obtained on the decays of ^{73}Zn and ^{74}Zn the authors give evidence that the earlier reported γ-ray activity attributed to ^{67}Ni belongs to the decay of the ^{70}Cu isomers. At $A=67$ we observed a new β-ray activity of 21(1) s half-life which is here assigned to the decay of ^{67}Ni. (29 refs.)

24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

65241 **Comparison of the semiclassical coupled channel theory of particle transfer with exact calculations.** H.Esbensen, R.A.Broglia, A.Winther (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).
Ann. Phys. (USA), vol.146, no.1, p.149-73 (March 1983).
Making use of numerical techniques recently developed, inelastic and transfer processes associated with the collision of two systems have been exactly solved in a one-dimensional model. Comparisons are carried out with a coupled channel treatment and perturbation theory. The results are used to estimate the validity of the different approximations for the case of collisions between heavy ions. (11 refs.)

65242 **Relation between scattering lengths and effective radii in the charged and neutral channels.** V.S.Popov, A.E.Kudryavtsev, V.I.Lisin, V.D.Mur (Inst. of Theoretical & Experimental Phys., Moscow, USSR).
JETP Lett. (USA), vol.36, no.6, p.257-60 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR),* vol.36, no.6, p.207-10 (20 Sept. 1982). [received: April 1983]
The Coulomb correction to the strong scattering length $a_l^{(s)}$ and the effective radius $r_l^{(s)}$ are calculated for states with arbitrary angular momentum l. This allows relating the position and width near threshold resonances in charged and neutral channels for the lightest nuclei (^{5}He and ^{5}Li, etc.). The Coulomb correction to $a_l^{(s)}$ is especially large for the s wave, while the correction to $r_l^{(s)}$ is large for the p wave, when they contain the large logarithm $\ln(a_B/r_0)$, where a_B is the Bohr radius and r_0 is the range of nuclear forces. (9 refs.)

65243 **An investigation of ^{86}Sr wave functions with the (p,α) reaction at $E_p=35$ MeV.** P.Schober, H.H.Mueller (Physikinst., Univ. Zurich, Zurich, Switzerland), W.Pfeifer, H.Jasicek.
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.203-20 (25 April 1983).
Wave functions of low-lying states in ^{86}Sr have been calculated in a model space including $1g_{9/2}$, $2p_{1/2}$, $2p_{3/2}$ sub-shells but neglecting the proton-neutron residual interaction. These wave functions have been tested by the ^{89}Y(p,α)^{86}Sr reaction at $E=35$ MeV by applying a DWBA analysis with microscopic form factors. (34 refs.)

65244 **An effective interaction for inelastic scattering derived from the Paris potential.** N.Anantaraman, H.Toki, G.F.Bertsch (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.269-78 (25 April 1983).
An effective interaction for inelastic scattering of nucleons from nuclei is derived by fitting oscillator *G*-matrix elements of the Paris nucleon-nucleon potential to the matrix elements of a sum of Yukawa terms. Except for the singlet-odd channel, these *G*-matrix elements do not differ in any significant respect from those obtained from the Reid soft-core potential, and give similar results for inelastic proton scattering. (19 refs.)

65245 **On the Pauli exchange mechanism in the interaction of composite nuclei.** G.Ciangaru (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.343-70 (25 April 1983).
The resonating group method kernel operators of composite nuclei interactions are investigated within a geometrical framework which relates the coordinates of the Pauli exchanged nucleons with the relative distance of nuclear fragments. Nucleon exchange density matrices, which contain detailed information about the Pauli exchange mechanism, are introduced to cast the kernel expressions in compact forms. A practical approach for calculating exchange kernels is given for certain applications in nuclear scattering and α-decay. (25 refs.)

65246 **A DWBA formalism for knockout-exchange reactions of composite nuclei.** G.Ciangaru (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.371-96 (25 April 1983).
A DWBA formulation of the knockout-exchange scattering of composite projectiles having zero internal orbital angular momentum is presented. The model problem assumes a target nucleus heavy enough to allow the neglect of its recoil. The formalism accommodates any form of nucleon-nucleon potential containing central, tensor and spin-orbit terms which are treated on the same footing, with no multipole expansions. The nonlocal radial integrals assume transition nucleon exchange density matrices characteristic of finite potential well shell-model target and cluster model projectile wave functions. The usefulness of the formalism is demonstrated with a PWBA numerical application to the ^{26}Mg(^{6}Li,^{6}He)^{26}Al reaction. (28 refs.)

65247 **Collective coordinates as open systems. II. Time-scale for pure-state propagation.** E.S.Hernandez, C.O.Dorso (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.181-9 (9 May 1983).
In the frame of a general master equation, the authors investigate the condition for the propagation of pure-state wave packets conditioned to the gain-loss competition between the different components. If a perturbative approach is adopted, it is shown that the Hamiltonian type of evolution is destroyed within the microscopic time-scale, thus inhibiting the possibility of simulating the motion via a frictional Schrodinger equation as frequently undertaken. (8 refs.)

24.30 RESONANCE REACTIONS AND SCATTERING

65248 Nuclear properties in the lead region within the quasiparticle-phonon nuclear model. V.G.Soloviev, C.Stoyanov, V.V.Voronov (Lab. of Theoretical Phys., JINR, Dubna, USSR).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.141-62 (9 May 1983).
The properties of the low-lying states and giant resonances in ^{208}Pb are calculated within the quasiparticle-phonon nuclear model, the model parameters being fixed. The fragmentation of the deep hole states $1h_{11/2}$, $1g_{7/2}$ and $1g_{9/2}$ in ^{207}Pb and $1g_{7/2}$, $1g_{9/2}$, $2p_{1/2}$ and $2p_{3/2}$ in ^{203,205,207}Tl is calculated, and qualitative agreement with the available experimental data is obtained. The s-, p- and d-wave neutron strength functions are calculated for ^{206}Pb+n and ^{207}Pb+n resonances. Their energy dependence is correctly described up to 0.9 MeV above the neutron binding energy B_n. The reduced E1 transition probabilities and the total photoabsorption cross sections $\sigma_{\gamma t}$ in ^{206,208}Pb are calculated. It is shown that substructures observed in the energy dependence $\sigma_{\gamma t}$ are caused by the fragmentation of one-phonon states. A fine structure of the isoscalar quadrupole resonance is explained, and the description of the LEOR and HEOR in ^{208}Pb is obtained, which is in agreement with the experimental data. (53 refs.)

24.70 POLARIZATION IN REACTIONS AND SCATTERING

65249 Deformation effect in the fast neutron total cross section of aligned ^{59}Co. U.Fasoli, G.Galeazzi, P.Pavan, D.Toniolo, G.Zago, R.Zannoni.
Report INFN/BE-82/2, Ist. Naz. Fis. Nucl., Padua, Italy (19 July 1982), 20 pp.
The variation of the total neutron cross section, $\Delta\sigma_{align}$, on ^{59}Co due to nuclear alignment of the target in the beam direction, has been measured over the energy range from 0.8 to 20 MeV, employing a cobalt single-crystal with a 34% nuclear alignment degree. The results show that $\Delta\sigma_{align}$ oscillates from a minimum of −5% at about 2.5 MeV to a maximum of +1% at about 10 MeV. The data were successfully fitted by optical model coupled-channel calculations. The coupling terms were deduced from a model representing the ^{59}Co nucleus as a vibrational ^{60}Ni core coupled to a proton-hole in a (1f 7/2) shell, without free parameters. The optical model parameters were determined by fitting the total cross-section independently measured. The theoretical calculations show that, at lower energies, $\Delta\sigma_{align}$ depends appreciably on the coupling with the low-lying levels. (40 refs.)

65250 Spin polarization in ^{20}Ne+^{168}Er collisions at 13.5 MeV/N. W.Dunnweber, W.Hering, R.Ritzka, W.Trautmann, W.Trombik, C.Egelhaaf, H.Homeyer (HMI fur Kernforschung, Berlin, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.97
In coincidence with light fragments from 270-MeV ^{20}Ne+^{168}Er, detected at 35°, the authors have measured the circular polarization P_γ of the γ-radiation along the scattering normal $K_i\times k_f$. From P_γ they deduce the relative contributions with negative and positive scattering angles to the differential cross section by taking into account the effects of non-aligned primary spin, of neutron evaporation and on non-stretched γ-decay. In the case of the deep-inelastic events they find that pure negative-(positive-) angle-scattering would correspond to $P_\gamma\approx+50\%$ (-50%). (no refs.)

24.90 OTHER TOPICS IN NUCLEAR REACTIONS AND SCATTERING, GENERAL

65251 Conclusions to be drawn from the workshop on future directions in electromagnetic nuclear physics. T.W.Donnelly (Dept. of Phys., MIT, Cambridge, MA, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.25-35 vol.1
The author summarizes some of the main conclusions to be drawn from the Workshop on Future Directions in Electromagnetic Nuclear Physics which began in the fall of 1979 and resulted in the Workshop report (commonly referred to as the 'Blue Book') in the spring of 1981. It is only possible in such a brief summary to be very general and, indeed, this talk might be regarded as one person's roadmap through the Blue Book, lacking any detail, but trying to identify the major features. In being so, it of course becomes a personal view of the highlights of the material in the report. (no refs.)

25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

65252 The polarized beam asymmetry for $\gamma d\rightarrow Pn$ in the energy range 0.4-0.8 GeV. F.V.Adamyan, G.V.Arustamyan, P.I.Galumyan, V.H.Grabsky, H.H.Hakopyan, V.V.Karapetyan, H.A.Vartapetyan (Yerevan Phys. Inst., Yerevan, Armenian SSR).
AIP Conf. Proc. (USA), no.95, p.252-4 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Measurements of the polarized beam asymmetry for deuteron photodisintegration $\gamma d\rightarrow Pn$ have been carried out in the energy range $E_\gamma=0.4$-0.8 MeV and at angles $\theta_p^{cm}=45°$-75°. The results obtained are in disagreement with theoretical predictions which take into account the dibaryon resonance contribution. The data qualitative analysis indicates the weakness of isoscalar dibaryon amplitudes near $E_\gamma=400$ MeV. (8 refs.)

65253 Comment on the scaling behavior of Delbruck amplitudes. P.Rullhusen, U.Zurmuhl, F.Smend, M.Schumacher (II Phys. Inst., Univ. Gottingen, Gottingen, Germany), H.G.Borner, S.A.Kerr.
Phys. Rev. D (USA), vol.27, no.8, p.1962-4 (15 April 1983).
The authors compare the scaling behavior of Delbruck amplitudes recently predicted by Cheng, Tsai and Zhu (1982) with calculated lowest-order amplitudes and with empirical Coulomb-correction terms. The scaling behavior is confirmed for the lowest-order amplitudes at energies above 6 MeV and large scattering angles. The Coulomb-correction terms do not show the scaling behavior at least below energies of 10 MeV. (15 refs.)

65254 Photonuclear reactions at intermediate energies. J.H.Koch (Nat. Inst. for Nuclear & High Energy Phys., Amsterdam, Netherlands).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.226-36 vol.2
The Δ-hole approach provides a unified approach to study pion- and photon-induced nuclear reactions at intermediate energy. In this framework, it is shown that the many body modifications of Δ-h propagation, which were previously studied in pion scattering, also play an important role in photonuclear processes. Examples of this are shown for photoabsorption and coherent π^0 photoproduction. The detailed description of the Δ-h dynamics also allows one to decompose the total photoabsorption cross section into the major reaction channels. This makes it possible, for example, to compare directly to the measured charged hadron yield for photoabsorption on ^{4}He. (22 refs.)

65255 Coherent (γ,γ) reactions in the resonance region. E.Booth, J.Miller (Boston Univ., Boston, NY, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.237-48 vol.2
Elastic photon (Compton) scattering from complex nuclei is a fundamental reaction which is largely unexplored, especially above the pion threshold. At very forward angles, the amplitude is dominated by scattering from the Coulomb field of the nucleus (Delbruck scattering) and by atomic electrons (conventional electron Compton scattering). Beyond a few degrees, Delbruck scattering becomes negligible in the delta region, while photons scattered from electrons have energies of only a few MeV. The remaining nuclear Compton scattering between 200 and 500 MeV is dominated by the delta isobar, in the same way as pion scattering and photoproduction. Compton scattering in the delta-resonance region, along with pion scattering and neutral photoproduction, can be described in terms of the isobar-hole dynamics. (10 refs.)

25.40 NUCLEON-INDUCED REACTIONS AND SCATTERING

(see also 28.20 Neutron physics)

65257 An experimental test of charge symmetry in n-p elastic scattering. J.Birchall, N.E.Davison, H.P.Gubler, W.P.Lee, J.P.Svenne, W.T.H.van Oers (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada), E.B.Cairns, H.Coombes, C.A.Davis, P.Green, L.G.Greeniaus, W.J.McDonald, G.A.Moss, G.Roy, J.Soukup, G.M.Stinson, H.E.Conzett, G.R.Plattner.
AIP Conf. Proc. (USA), no.95, p.165-7 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
An experiment is described to investigate the isospin-mixing, charge-symmetry breaking component in the n-p interaction. The experiment measures the difference ΔA between the neutron and proton analyzing powers A_n and A_p in n-p elastic scattering at 500 MeV. The exeriment consists of two interleaved phases in which polarised neutrons, respectively unpolarized neutrons are scattered from an unpolarized, respectively polarized proton target of the frozen spin type. Designed as a null measurement requiring no accurately known polarization standards, the experiment determines the difference in angle at which A_n and A_p cross through zero. It is intended to provide an unambiguous test of class IV charge-symmetry breaking effects to the level of $_{G}A \simeq 0.001$, corresponding to a laboratory angle difference at zero crossing of $\sim 0.05°$. (6 refs.)

65258 Angular and energy dependence of the analyzing power A_{yo} of the reaction $p+p \rightarrow d+\pi^+$ between 725 and 1000 MeV. R.Bertini, P.Catillon, J.M.Cameron, H.Catz, J.M.Durand, G.P.Gervino, J.C.Lugol, B.Mayer (CENS, Guf-sur-Yvette, France), J.Arvieuz, S.Baker, L.Farvacque, C.Glashausser, D.A.Hutcheon, C.Whitten, G.Smith, A.Yavin.
AIP Conf. Proc. (USA), no.95, p.231-3 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The discovery of structure in spin-dependent cross sections for proton-proton scattering has been interpreted as evidence for dibaryon resonances. Resonance-like behaviour has been observed in several partial waves. The authors present results on the angular and energy dependence of differential cross sections ($d\sigma/d\Omega$) and vector analyzing power A_y of the $pp \rightarrow d\pi$ reaction between 725 and 1000 MeV, in steps of about 25 MeV, using the polarized proton beam of Saturne 2. Data were obtained by using the spectrometer SPES I to measure deuteron angle and momentum, which combined with time-of-flight information, clearly identified deuterons from $pp \rightarrow d\pi$, and permitted transformation of data to pion c.m. angle ($\theta_{cm}{}^{\pi}$). (6 refs.)

65259 Measurement of analyzing power in the $pp \rightarrow \pi^+d$ reaction. J.Hoftiezer, C.Weddigen (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), S.Jaccard, P.Walden, P.Chatelain, B.Favier, F.Foroughi, J.Piffaretti.
AIP Conf. Proc. (USA), no.95, p.237-9 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The analyzing power, A_{yo}, of the reaction $pp \rightarrow \pi^+d$ has been measured to an accuracy of about 1% at 4 energies between 500 and 600 MeV at SIN. Pions and deuterons were detected in coincidence with scintillation detectors, using TOF techniques for event identification. Asymmetry results show considerable energy dependence in magnitude and shape. Final results have been fit, together with precise differential cross section data and muon detection. Numerical values of Legendre polynomial coefficients to describe A_{yo} and the differential cross section are presented. (2 refs.)

65260 On mean number of collisions in high energy hadron-nucleus interaction. J.Dolejsi, J.Formanek (Nuclear Centre, Charles Univ., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.389-400 (1983).
A mean number of collisions ν_{pA} in high energy proton-nucleus interactions is computed for different extrapolations of an elementary proton-nucleon amplitude. The power *A*-dependence parametrization of ν_{pA} is discussed in some detail. (14 refs.)

65261 Subthreshold K^+ production in the interaction of 1-GeV protons with Be, C, Al, Cu, Sn, and Pb nuclei. N.K.Abrosimov, V.A.Volchenkov, V.A.Gordeev, V.A.Eliseev, E.M.Ivanov, V.P.Koptev, S.P.Kruglov, Yu.A.Malov, S.M.Mikirtych'yants, G.A.Ryabov, G.V.Shcherbakov (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.261-4 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.211-13 (20 Sept. 1982). [received: April 1983]
A new method is described for studying the 'subthreshold' production of K^+ mesons. The μ^+ mesons from the K^+ mesons stopped in the target are detected, and the microstructure of the proton beam is used. The total cross sections for K^+ production have been measured for the interaction of 1-GeV protons with Be, C, Al, Cu, Sn, and Pb nuclei. (5 refs.)

65262 Semi-microscopic calculations of inelastic neutron scattering from heavy deformed nuclei. C.Lagrange, M.Girod (Service de Phys., Neutronique et Nucleaire, Centre d'Etudes de Bryeres-le-Chatel, Montrouge, France).
J. Phys. G (GB), vol.9, no.5, p.L97-102 (May 1983).
Semi-microscopic calculations of neutron elastic and inelastic scattering cross sections are calculated between 3.4 and 15 MeV by utilising the microscopic optical model of Jeukenne, Lejeune and Mahaux (1977) together with Hartree-Fock-Bogolyubov deformed nucleon density distributions. The coupled-channel formalism and the adiabatic rotational model are employed. With values for the range of the effective interaction previously determined for ^{208}Pb, the authors find that the theory gives a good description of neutron scattering from ^{238}U, ^{232}Th and ^{154}Sm. (21 refs.)

65263 Alpha-cluster break-up and reaction mechanism in (p,α) reactions on light nuclei. W.Buck, F.Hoyler, A.Stabler, G.Staudt (Phys. Inst., Univ. Tubingen, Tubingen, Germany), H.V.Klapdor, H.Oeschler.
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.189-202 (25 April 1983).
The differential cross sections for the $^{11}B(p,\alpha)^8Be$ and $^{23}Na(p,\alpha)^{20}Ne$ reactions were measured at bombarding energies between 6 and 24 MeV. The observed angular distributions can be divided into two domains: at low energies the shapes vary rapidly with incident energy indicating a compound nucleus reaction; at higher energies rather stable diffraction patterns are seen exhibiting a direct reaction mechanism and DWBA calculations are able to describe the shapes. The change from one region to the other is rather abrupt and this behaviour seems typical for reactions having an α-like compound nucleus. The energy at which this change occurs corresponds to an excitation energy in the compound nucleus of about 20 MeV above the α-threshold. (41 refs.)

65264 The $^{249}Bk(p,t)^{247}Bk$ reaction. R.A.Dewberry, R.T.Kouzes, R.A.Naumann (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA), R.G.Lanier, H.G.Borner, R.Hoff.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.1-10 (9 May 1983).
The $^{249}Bk(p,t)^{247}Bk$ reaction was performed with a 15 MeV proton beam from the Princeton University AVF cyclotron. The outgoing tritons were magnetically analyzed by a QDDD spectrometer. A DWBA analysis was performed, and a good $L=0$ angular distribution was observed populating the $^7/_2{}^+[633]$ bandhead in ^{247}Bk. Levels up to the $^{15}/_2$ member of this rotational band were populated at 41, 84, 137, 196 and 265 keV. No other peaks were observed. The absence of strength in the $^5/_2{}^+[642]$ band is shown to be consistent with the degree of mixing expected from calculation of the Coriolis interaction. The ground state of ^{249}Bk is discussed in terms of the gap in the neutron Nilsson levels at $N=152$. (24 refs.)

65265 Proton capture by ^{11}B above the giant resonance. M.Anghinolfi, P.Corvisiero, G.Ricco, M.Taiuti, A.Zucchiatti (Istituto di Sci. Fisiche, Univ. di Genova, Genova, Italy).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.66-82 (9 May 1983).
The cross sections for proton capture by ^{11}B to the ground and excited states of ^{12}C have been measured in the proton energy interval between 18 and 43 MeV. The ground-state cross section shows good agreement with theoretical calculations including correlations. Capture photons have also been observed to all the residual 1p-1h states of ^{12}C having a dominant $1p_{3/2}{}^{-1}$ hole: the corresponding cross sections systematically show a giant resonance whose energy increases with the increasing excitation energy of the 'background' level. The resonances at 27.4, 31, 33.2, 37 and 43 MeV, seem to show observable interference effects. (29 refs.)

65266 Cross-section measurement and Lane model analysis for the $^9Be(p,n)^9B$ reaction. R.C.Byrd, C.E.Floyd, P.P.Guss, K.Murphy, R.L.Walter (Dept. of Phys., Duke Univ., Durham, NC, USA).
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.94-118 (9 May 1983).
Neutron time-of-flight techniques were used to measure the $^9Be(p,n_0)^9B$ cross section from 0° to 160°(lab) at 10 energies between 8.15 and 15.68 MeV. The data are combined with previous results below 30 MeV in a Legendre coefficient analysis to evaluate the differential and integral behavior of the ^{9}Be(p,n) and $^9Be(p,n_0)^9B$ cross sections. A coupled-channels Lane analysis of cross sections and analyzing powers for (p,n) quasi-elastic scattering and (p,p) and (n,n) elastic scattering is presented and compared to previous single-channel models. (54 refs.)

65267 Reaction ^{48}Ca (*p,n*) ^{48}Sc from $E_p=1.885$ to 5.1 MeV. Gulzar Singh (Cyclotron Lab., Punjab Univ., Chandigarh, India), S.Kailas, S.Saini, A.Chatterjee, M.Balakrishnan, M.K.Mehta.
Pramana (India), vol.19, no.6, p.565-77 (Dec. 1982). [received: April 1983]
The total (*p, n*) reaction cross section for ^{48}Ca has been measured as a function of proton energy in the energy range 1.885 to 5.100 MeV with an overall resolution of ~2 keV and in ~5 keV energy steps. The fluctuations in fine resolution data have been analysed to determine the average coherence

width $\langle\Gamma\rangle$. The excitation function averaged over large energy intervals has been analysed in terms of the optical model. The isobaric analogue resonances at $E_p \sim 1.95$ and 4 MeV have been shape-analysed to extract the proton partial width and the spectroscopic factor S_n. A comparison of the gross structures observed in ~55 keV averaged excitation function with the predictions of Izumo's (1965) partial equilibrium model has also been made. (31 refs.)

65268 Evaluation of neutron cross sections for vanadium. S.Tanaka.
Report JAERI-M-82-151, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Oct. 1982), 41 pp.
Comprehensive neutron nuclear data for vanadium have been evaluated from thermal region to 20 MeV, and the results are to be filed in the ENDF/B format as an elemental component in Japanese Evaluated Nuclear Data Library-Version 2 (JENDL-2). The data base, the evaluation procedure and judgement, and the final results are described. The results include the neutron total cross sections, all significant partial cross sections of neutron induced reactions and the resonance parameters of vanadium. Particular attention has been payed to higher energy processes having an impact on the FBR and CTR. (46 refs.)

65269 Large transverse momentum transfer at 1 GeV proton disintegration of ^{238}U target. Yu.A.Chestnov, B.L.Gorshkov, A.I.Iljin, B.Yu.Sokolovski, G.E.Solyakin (Leningrad Nuclear Phys. Inst., Gatchina, USSR).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.90
Correlation kinematics measurements of complementary fragments are useful for understanding the interaction mechanisms of relativistic protons with heavy nuclei. Both masses and energies of complementary fragments were measured for ^{238}U target bombarded by a 1 GeV proton beam. The measurements were carried out for the fragments moving at the opposite direction perpendicular to the primary beam. The value $P_T = P_H - P_L = (2M_H E_H)^{1/2} - (2M_L E_L)^{1/2}$ was determined for every event, where subscripts H and L mean heavy and light fragments respectively. (1 ref.)

25.50 ^{2}H- AND ^{3}H-INDUCED REACTIONS AND SCATTERING

65270 Tensor analyzing power in d-p elastic scattering at backward angles. J.Arvieux, S.D.Baker (Lab. Nat. Saturne, Gif-sur-Yvette, France), J.Banaigs, J.Berger, R.Beurtey, M.Boivin, A.Boudard, J.M.Cameron, A.Codino, J.Duflo, G.Gaillard, L.Goldzahl, D.A.Hutcheon, Nguyen-van-sen, C.F.Perdrisat, F.Plouin.
AIP Conf. Proc. (USA), no.95, p.228-30 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The tensor alignment T_{20} of 0.3 to 2.3 GeV polarized deuterons scattered by hydrogen has been measured at or near 180° CM angles, using the Saturne synchrotron. Large values are 0.5 GeV. The data are compared to various theoretical calculations including one-nucleon exchange with or without N components in the deuteron wave-function, a triangular graph with pion-exchange and rescattering mechanisms. (7 refs.)

25.60 ^{3}HE- AND ^{4}HE-INDUCED REACTIONS AND SCATTERING

65271 Channel cross correlations and intermediate structure in the ^{27}Al(d,α)^{25}Mg and ^{27}Al(d,p)^{28}Al reactions. S.C.Yeh, C.C.Hsu, J.C.Wang (Dept. of Phys., Nat. Tsing Hua Univ., Hsinchu, Taiwan), H.H.Lin, V.K.C.Cheng.
J. Phys. G (GB), vol.9, no.5, p.545-54 (May 1983).
The excitation functions of the protons and α particles for $\theta_{lab} = 90°$ and 160° from the reactions ^{27}Al(d,α)^{25}Mg and ^{27}Al(d,p)^{28}Al were measured in the range $E_d = 3.5$-6.2 MeV and analysed by the channel cross correlation function and autocorrelation function to determine the correlating number N_d and the average total level width $\langle\Gamma_\mu\rangle$, respectively. The energy-averaged angular distributions were fitted by the formula of Feshback (1960) to obtain the value of $\langle\Gamma_\mu\rangle/D$. With these quantities the theoretical intermediate width $\langle\Gamma_d\uparrow\rangle$ was calculated to be 206 keV, which is in good agreement with the experimental value 200±37 keV. In addition, the value of $n_d(n_d-1)/n^2$ was determined to be 0.30, which is quite close to the theoretical prediction $(2D/\pi\langle\Gamma_\mu\rangle)^{1/2} = 0.25 \pm 0.4$. (19 refs.)

25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

65272 Inelastic scattering of ^{16}O from ^{60}Ni at 114 MeV. O.Hansen, P.D.Bond, S.Kubono, M.J.Levine, C.E.Thorn (Dept. of Phys., Brookhaven Nat. Lab., Upton, NY, USA).
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.325-42 (25 April 1983).
The ^{60}Ni(^{16}O,^{16}O′) reaction has been measured with about 100 keV energy resolution at a bombarding energy of 114 MeV. Twelve transitions to 2^+, 3^-, 4^+ and 5^- states were observed in the region below 5.8 MeV excitation and angular distributions of the corresponding differential cross sections were measured. DWBA and CC analyses are presented and spectroscopic information, in particular pertaining to the two-phonon strengths, is deduced. The deformation lengths $\beta_L R_2$ are compared to previous results from inelastic scattering with ^{4}He, ^{14}C and ^{16}O particles. Supplementary data in the region of the giant quadrupole resonance (GQR) were obtained, although the GQR was not identified. The experimental results are used in a discussion of the energy loss process in heavy ion collisions. (24 refs.)

65273 The ^{24}Mg(^{16}O,^{16}O′) reaction and triaxial structures in ^{24}Mg. J.Nurzynski, C.H.Atwood, T.R.Ophel, D.F.Hebbard (Dept. of Nuclear Phys., Australian Nat. Univ., Canberra, Australia), B.A.Robson, R.Smith.
Nucl. Phys. A (Netherlands), vol.A399, no.1, p.259-74 (9 May 1983).
Angular distributions for the elastic and inelastic scattering of ^{16}O from ^{24}Mg, exciting the 2_1^+ (1.37 MeV), 4_1^+ (4.12 MeV) and 2_2^+ (4.24 MeV) states, have been measured at $E_{c.m.} = 43.5$ MeV, an energy at which resonance-like structure has been observed previously in the related ^{24}Mg(^{16}O,^{12}C)^{28}Si reaction. In particular, the 4_1^+,2_2^+ doublet has been resolved for the first time for heavy-ion projectiles. The data have been well described by coupled-channels calculations within the framework of a Davydov-Filippov asymmetric rotor model for the low-lying states of ^{24}Mg, which has been extended to include a symmetric hexadecapole shape component. The optical model potential for the ^{16}O+^{24}Mg interaction was found to have a moderate real well depth and some surface transparency. The shape parameters for the nuclear potential were determined to be $\beta_2^{(N)} = 0.25$, $\gamma = 22°$ and $\beta_4^{(N)} = -0.065$ and the corresponding deformation lengths are in good agreement with earlier light-ion results. The inclusion of a negative symmetric hexadecapole component leads to an improved description of the reduced transition rates. The triaxial structure of ^{24}Mg is discussed. (42 refs.)

65274 Neutron multiplicity distributions and the role of transfer and breakup in quasielastic heavy-ion reactions at 15 MeV/nucleon. U.Jahnke, G.Ingold, H.Homeyer, M.Burgel, C.Egelhaaf, H.Fuchs, D.Hilscher (Hahn-Meitner-Inst. for Kernforschung Berlin, Berlin, Germany).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1246-9 (25 April 1983).
A new tool for the study of heavy-ion reactions is obtained by adapting a 4π-neutron-multiplicity counter to accelerator experiments. The instrument registers almost all neutrons emitted in each single reaction event. For quasielastic rections of 290-MeV ^{20}Ne+^{197}Au the measured neutron multiplicity distributions allow a quantitative decomposition of the cross section into two contributions: one with higher Q value from transfer reactions, one with lower Q value due to the decay of the projectilelike fragments. (14 refs.)

65275 Extraction of the preformation probability of an α-cluster at the surface of heavy nuclei by means of α-transfer reactions leading to the continuum states. Xu Shu-wei, Wu Guo-hua, Miao Rong-zhi, Han Fei (Inst. of Modern Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.95-100 (Jan. 1983). In Chinese.
The method of the parametrization of EFR-DWBA overlap integrals developed by T. Udagawa and T. Tamura et al. (1980), is improved. Using the improved method the present authors have fitted the experimental double differential energy spectrum of ^{8}Be-clusters coming from the reaction ^{208}Pb(^{12}C, ^{8}Be)^{212}Po leading to the continuum states and extracted the preformation probability of α-clusters at the surface of ^{212}Po nucleus. Within the range of calculation error, the result is in agreement with that extracted from fitting the experimental data of α-decay. (16 refs.)

65276 The subthreshold mechanism of the ^{6}Li+^{6}Li→3 α reaction at low energy. M.Lattuada, F.Riggi, C.Spitaleri, C.M.Sutera, D.Vinciguerra (Istituto di Fisica, Univ. di Catania, Catania, Italy).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.78
Many aspects of the nuclear reactions involving ^{6}Li have been interpreted by describing this nucleus in terms of an α-d cluster structure. This is the case for (p,pd) or (p,pα) quasi-free reactions, for (^{6}Li,d) and (^{6}Li,α) transfer reactions and for ^{6}Li break-up. Here, the authors discuss a subthreshold process in the ^{6}Li+^{6}Li→3α reaction, which can be only explained in terms of the α-d structure of ^{6}Li. The work of Norbeck et al. (1981) who measured the angular correlation between two α-particles at 2 MeV, shows that this reaction can be described by a quasi-free process in which one of the α-clusters (either in the projectile or in the target) is spectator of the ^{6}Li+d→2α virtual reaction, once the relative motion of the two ^{6}Li ions is brought to rest by the Coulomb repulsion. (3 refs.)

65277 Semiclassical calculations of ^{16}O-^{16}O elastic scattering cross-sections. P.C.Sood, C.Maheshwari (Banaras Hindu Univ., Varanasi, India), S.Mukherjee, R.K.Samanta.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.79
The authors use the generalized JWKB method to calculate the cross-sections for ^{16}O-^{16}O elastic scattering. The effect of inclusion of a realistic Coulomb potential is investigated in detail. They have calculated the phase shifts and the symmetrized cross-sections for the ^{16}O-^{16}O elastic scattering in the c.m. energy range 30-60 MeV. The nuclear potential parameters of Maher et al., (1969), are adopted. The phase shifts are calculated explicitly up to L=60 beyond which only Coulomb contribution is assumed. (4 refs.)

65278 The deep inelastic yield at backward angles from ^{28}Si+^{12}C. D.Shapira, K.A.Erb, J.L.C.Ford,Jr., R.Novotny, M.D.Schull, B.Shivakumar (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), S.T.Thornton, R.L.Parks, R.A.Cecil.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.80
Target-like reaction products from the bombardment of C targets by ^{28}Si beams have been studied at many bombarding energies in the range $99 \leq E_{Si} \leq 190$ MeV using the Brookhaven tandem accelerator. The reaction products were identified over a wide dynamic range of the outgoing fragment's kinetic energies using energy and energy loss information. Angular distributions were measured over the range of 2° to 30° (lab). The target-like

products observed at forward angles correspond (in the c.m. system) to the same products emitted at backward angles in a reversed reaction (target and projectile interchanged). The yield of these products is concentrated around a large negative O-value and the cross sections account for some 25% of the total non-fusion yield. Systematic studies of exit channel, bombarding energy, and observation angle dependence of these yields show essentially complete damping of the initial kinetic energy and imply the formation of a long-lived rotating dinuclear complex (orbiting) at an early stage of the collision. (1 ref.)

65279 **A macroscopic model for low energy heavy ion collisions.** G.F.Bertsch (Phys. & Astron. Dept., Michigan State Univ., East Lansing, MI, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.81
To have a better understanding of TDHF physics, there is a need for a simple model which mimics the TDHF dynamics. A suitable model would also permit one to make approximations to features of the dynamics that lie beyond the scope of TDHF. To this end the author proposes here a classical model in which only the most essential geometric variables are retained. Besides the relative coordinate of the centres-of-mass of the two nuclei, the author considers one additional geometric variable, the radius of a neck region connecting the two nuclei. The model is defined by considering the various sources of momentum transfer from one nucleus to another: namely, the Coulomb force, the nucleon flux between nuclei, and the nuclear force. These three forces can be simply parameterized in terms of the defined geometric variables. The relation between these variables is in turn parameterized according to the TDHF dynamics. The model gives reasonable deflection function and energy lossin collisions between very heavy nuclei, showing the deep inelastic scattering phenomenon. (3 refs.)

65280 **Quasi linear response theory: analysis of the friction tensor and the energy transport.** K.Niita, N.Takigawa (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.82
Reports on an analysis of the energy transport in deep inelastic heavy ion collisions by means of the quasi linear response theory, which extends the conventional linear response theory by consistently treating the relative motion and the intrinsic excitations based on a many body von Neumann equation and by taking into account higher order perturbation terms with respect to the coupling Hamiltonian between the relative and intrinsic motions in terms of Green's functions. Pb+Pb scattering is used as an example. (5 refs.)

65281 **Energy dependence of the friction coefficients.** E.N.El-Sayed (Dept. of Academic Studies, Arab Maritime Transport Acad., Alexandria, Egypt).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.83
The DIC and fusion experimental data are usually fitted with linear velocity dependent friction force. Nethertheless, some works suggest a non-linear velocity dependence of the nuclear friction. Starting from, this observation, the behaviour of the friction tensor (FC) as a function of energy can be studied by relating it to the imaginary potential. The radial- and energy dependence of the FC are given for ^{40}Ca-^{40}Ca head-on-collision case. (5 refs.)

65282 **Transfer induced energy dissipation in quasielastic collisions.** S.Pontoppidan (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.84
The mechanism of energy dissipation in heavy ion collisions have been investigated through a study of Q_{opt}-values obtained from 27 different reactions. The lightest system was $^{16}O+^{27}Al$ and the heaviest $^{56}Fe+^{122}Sn$. Each of these experiments allowed a complete Z and A identification of the reaction products. If only grazing angle spectra are considered one can with reasonable certainty identify the number of transferred nucleons as $\Delta M=|N'-N|+|Z'-Z|$, where (Z,N) and (Z',N') are the proton and neutron numbers for the projectile and the projectile-like reaction product, respectively. Q_{opt} is defined as the Q-value where the energy spectrum has its maximum. (6 refs.)

65283 **Angular distributions around O° of quasi elastic and deep inelastic reactions in light heavy ion collisions.** J.Payet, F.Pougheon, M.Bernas, P.Dessagne, D.Guillemaud, P.Roussel (Inst. de Phys. Nucleaire, Orsay, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.85
Due to obvious experimental difficulties, very few angular distributions are known at very forward angles and especially at 0°. These measurements however are important for nuclear spectroscopy and for the study of reaction mechanisms in heavy ions collisions. At Tandem energies, the suitable angular range will be between $\theta=0°$ and $\theta=5°$ lab. In this range the first lobe of the diffraction figure and the glory effects, if existing, can be observed. The authors report on results of a systematic study of the energy spectra and the very forward angular distributions $(-1°<0_{lab}<11°)$ of reaction products obtained by bombarding ^{12}C, ^{27}Al ^{26}Mg targets with ^{18}O 100 MeV beam from the Orsay MP Tandem. (1 ref.)

65284 **Effects of Pauli blocking and the local Fermi momentum in HI transfer reactions.** S.Pontoppidan (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.86 (1 ref.)

65285 **Alternative analysis of heavy-ion collisions involving nucleon transfer.** S.Marsh (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.87
Excitation energy spectra are analyzed using a fermi gas prior distribution. The author finds that good fits to the data may also be obtained using a 'prior' distribution inspired by the exciton model: $P(E^*)=(E^*)^N \exp(-E^*/\Delta)$, where N and Δ are adjustable parameters. If taken literally, these two analyses would imply very different reaction processes: in the first, the reaction reaches a constrained equilibrium, whereas in the second the reaction appears to be multi-step direct. It is concluded therefore, that although the maximum entropy fits to the data are very good, this should not be taken as conclusive evidence for a particular reaction mechanism. (2 refs.)

65286 **A kinetic flow analysis of streamer chamber data for Ne on NaF and Ar on Pb_3O_4.** D.Keane, D.Beavis, S.Y.Fung, W.Gorn, A.Huie, J.J.Lu, R.T.Poe, B.C.Shen, G.VanDalen (Dept. of Phys., Univ. of California, Riverside, CA, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.89
In relativistic nucleus-nucleus collisions, the emergence of exclusive data from 4π detectors has motivated the development of 'global analyses' where the hydrodynamic or other possible collective behavior of nuclear matter in collisions can most effectively be studied. Recently, Gyulassy, Frankel and Stocker (1982) have proposed a kinetic flow analysis in which an event shape is associated with a kinetic flow tensor F, constructed from a set of measured final momenta in the c.m. frame: $F_{ij}=\Sigma_{\nu=1}{}^{N}\ P_i(\nu)\ P_j(\nu)/2m_\nu$ They also suggest a flow diagram in which the kinetic flow ratio f_1/f_3 (the ratio of the largest to smallest eigenvalue of F) is plotted against the polar angle of maximum kinetic flow. This analysis is used in the present study of two exclusive data samples: 1824 high multiplicity events corresponding to 425 MeV/A Ne on a 1.43 g/cm^2 NaF target, and 121 high multiplicity events corresponding to 400 MeV/A Ar on a 1.17 g/cm^2 Pb_3O_4 target. (2 refs.)

65287 **Systematics of linear momentum transfer in nucleus-nucleus collisions.** V.E.Viola,Jr., K.K.Kwiatkowski (Dept. of Chem., Indiana Univ., Bloomington, IN, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.91
The authors briefly summarize some of the salient systematic trends in the linear momentum transfer distributions derived from fission fragment angular correlation data at energies which extend well above the interaction barrier. At energies near the interaction barrier the fission fragment angular correlation data are characterized by two principal components: (1) a well-defined peak corresponding approximately to complete linear momentum transfer, or fusion-like reactions, σ_F, and (2) a broad distribution of events concentrated at momentum tranfer expected for peripherals reactions. Below 20-30 MeV/nucleon the linear momentum distributions for a variety of projectiles, ranging from protons to ^{20}Ne, can be parameterized consistently in terms of the projectile momentum and velocity or the average momentum transfer per nucleon. (4 refs.)

65288 **Light particle emission in projectile breakup process of heavy-ion reactions.** H.Utsunomiya, S.Kubono, M.H.Tanaka, M.Sugitani, K.Morita, T.Nomura, Y.Hamajima (Inst. for Nuclear Study, Univ. of Tokyo, Tanashi-shi, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.95
Reports on the magnitude and alignment of the transferred angular momenta associated with the projectile breakup process with the following capture property; i.e. after the breakup of projectle, a part of projectile is captured by a target nucleus. Importance of such mechanism for fast α-particle emission in heavy-ion reactions has recently been pointed out by several authors who often call the mechanism 'massive transfer' or 'breakup-fusion'. The authors have measured in-plane and out-of-plane angular correlations of fission fragments in coincidence with fast light particles emitted at 20° in the ^{232}Th(^{7}Li,xf) (x=p,d,t,α) reaction at 77 MeV. (3 refs.)

65289 **Angular momentum transfer in deep inelastic collisions: alignment and misalignment of fragment spin.** J.C.Steckmeyer, C.Le Brun, J.F.Lecolley, F.Lefebvres, M.L'Haridon, A.Osmont, J.P.Patry (Lab. de Phys. Corpusculaire, Univ. de Caen, Caen, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.96
Angular momentum transfer has been studied with sequential fission method in 255 MeV and 295 MeV Ar-Bi and 435 MeV Ni-Pb deep inelastic colisions. The sequential fission method allows one to measure both the aligned part and the in plane components of the heavy fragment spin and so to obtain informations about spin misalignment mechanisms occurring in the deep inelastic interaction. (4 refs.)

65290 **The relative contributions of positive and negative-angle scattering in ^{86}Kr-induced reactions.** J.de Boer, Ch.Schandera, Ch.Lauterbach, W.Dunnweber, W.Trautmann (Sektion Phys., Ludwig-Maximilians Univ., Munchen, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.98
The relative contribution to the cross section from trajectories with positive and negative sign of the scattering angle was determined for the $^{86}Kr+^{139}La$ and for the $^{86}Kr+^{166}Er$ reactions at incident energies of 705 MeV and of 860 MeV. For that purpose the circular polarization P_γ of γ-rays emitted in coincidence with the reaction products was measured as a function of the scattering angle θ_{lab} of the mass A, and of the Q-value of the ejectiles. (no refs.)

65291 **Processes in competition in the reaction $^{14}N+^{12}C$.** E.Bozek, Y.Cassagnou, R.Dayras, R.Legrain, A.Pagano, A.Palmeri, L.Rodriguez (DPh-NB/Be, CENS, Gif-sur-Yvette, France), G.Lanzano, G.Pappalardo.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.99
At energy slightly higher than the fusion barrier, the fusion process between light complex nuclei is limited by competition with direct reaction channels. In order to separate between the different competing mechanisms, the authors have undertaken a detail led study of the $^{14}N+^{12}C$ reaction at 62.7 MeV.s Light particles (p,d,t, ^{3}He and ^{4}He) were detected in coincidence with heavy fragments in a coplanar geometry. The heavy ion telescope was kept fixed at 10° relative to the beam directivity whereas three light-particle telescopes were moved on the other side of the beam to cover the angular range between 10° and 170°. (no refs.)

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

65292 Evidence for dibaryon resonances from the measurement of the tensor polarization t_{20} in π^+-d scattering. W.Gruebler, J.Ulbricht, V.Konig, P.A.Schmelzbach, A.Chisholm, K.Elsner, C.Schweizer, M.Merdzan (Lab. fur Kernphys., ETH, Zurich, Switzerland).
AIP Conf. Proc. (USA), no.95, p.234-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The tensor polarization t_{20} of π^+-d elastic scattering has been measured at 117 MeV, 134 MeV, 142 MeV and 151 MeV as a function of scattering angle. While at 134 MeV a strong and oscillatory behaviour prevails over the angular range measured (100-180°C c.m.), a considerable flattening of this structure is observed at 117 MeV and 151 MeV. This energy dependence and other observations are believed to manifest evidence for the presence of non-conventional dynamics in this energy region. (7 refs.)

65293 Dibaryon search in the pi-d system. E.L.Mathie (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).
AIP Conf. Proc. (USA), no.95, p.240-2 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Measurements of the polarization parameter, it11 in elastic pi-d scattering at a few specific angles with 140 and 256 MeV pion energy have been cited as evidence for the 1G4 dibaryon resonance. Two new experiments have been performed within the last year to expand this data set and clarify the situation. The first new experiment added data at 220, 275 and 294 MeV and confirmed three forward angle points at 256 MeV. The second new experiment employed a completely different data collection scheme with a multiple arm time-of-flight spectrometer. (6 refs.)

65294 Single neutron emission following the π^- absorption at rest in ^{12}C. C.Cernigoi, R.Cherubini, D.Gill, N.Grion, G.Pauli, R.Rui.
Report INFN/AE-82/13, Ist. Naz. Fis. Nucl., Trieste, Italy (6 Dec. 1982), 23 pp.
Presents the results of a measurement of the inclusive energy spectrum of the neutrons, as well as of that of the protons, emitted after the absorption of negative pions at rest in ^{12}C. The high energy tail of the neutron spectrum exhibits a peak corresponding kinematically to the single neutron emission process ^{12}C(π^-,n)^{11}B. The area under such peak gives an emission rate of 1.7×10^{-2} per stopped pion. (16 refs.)

25.85 FISSION REACTIONS

65295 Fission of Bi induced by a quasi-monochromatic photon beam at energies from 100 MeV to 280 MeV. V.Bellini, V.Emma, S.Lo Nigro, C.Milone, G.S.Pappalardo (Istituto di Fisica, Univ. di Catania, Catania, Italy), E.De Sanctis, P.Di Giacomo, C.Guaraldo, V.Lucherini, E.Polli, A.R.Reolon.
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.587-92 (23 April 1983).
The photofision yields of Bi induced by the quasi-monochromatic photon beam from in-flight annihilation of positrons of the Frascati linac were measured. The experiment was performed at sixteen different positron energies, from 120 MeV up to 280 MeV, by collecting the annihilation photons at angles $0.5° < \theta < 1°$. Fission fragments were detected with glass sandwiches. Photofission cross-section values were deduced by means of an appropriate unfolding method. (15 refs.)

65296 Fission barriers of Pb nuclei at high angular momentum. D.J.Hinde, J.O.Newton, J.R.Leigh, R.J.Charity (Dept. of Nuclear Phys., Australian Nat. Univ., Canberra, Australia).
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.308-24 (25 April 1983).
Fission and evaporation residue excitation functions have been measured after the nuclei ^{192,195,198,200}Pb were formed by the fusion of ^{28,30}Si with ^{164,167,170}Er. The fission probabilities extracted were fitted using the rotating liquid drop/statistical model codes ORNL ALICE and MBII. The range of values of the mass asymmetry, $(N-Z)/A$, of the fissioning systems allows some restrictions to be placed on the value of the surface asymmetry parameter K, used in the liquid drop model, despite the many uncertainties and approximations in the data analysis. (28 refs.)

65297 Experimental fission barriers in heavy nuclei. D.Galeriu (Inst. de Fizica si Inginerie Nucleara, Bucuresti, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.34, no.9, p.827-70 (1982). In Rumanian.
Discusses deformed compound nucleus states classification, double humped barrier penetrability, collective enhancement of level densities, fission barriers from isomeric fission, barrier property from neutron induced fission, fission following direct reactions, fission barriers for neutron deficient nuclei, and fission barrier systematics. (116 refs.)

65298 Average number $\bar{\nu}_p$ of prompt neutrons in the fission of ^{236}U nuclei by neutrons in the energy range 0.8-6 MeV. V.V.Malinovskii, V.G.Vorob'eva, B.D.Kuz'minov, V.M.Piksaikin, N.N.Semenova.
Sov. At. Energy (USA), vol.53, no.2, p.536-9 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.83-6 (Aug. 1982). [received: April 1983]
The average number $\bar{\nu}_p$ of prompt fission neutrons is one of the important characteristic parameters of nuclei undergoing fission. The present work deals with research on the energy dependence of $\bar{\nu}_p$ in the fission of ^{236}U by neutrons. (8 refs.)

65299 Determination of the cumulative yields of short-lived products of thermal-neutron ^{239}Pu fission by means of the γ-spectrometric method under cyclic conditions. A.G.Golovanov, A.N.Gudkov, V.V.Kazantsev, V.V.Kovalenko, A.B.Koldobskii, V.M.Kolobashkin, S.I.Lifanov, A.I.Slyusarenko.
Sov. At. Energy (USA), vol.53, no.2, p.576 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.117 (Aug. 1982). [received: April 1983]
Analysis of the experimental data on the yields of short-lived ($T_{1/2} < 50$ sec) fission products (FP) resulting from thermal-neutron ^{239}Pu fission shows their obvious inadequacy for solving practical problems and for checking the efficiency of the calculation methods used to predict the yield values not determined by experiment. The authors have measured the cumulative yields of a number of short-lived FP resulting from ^{239}Pu fission by the thermal neutrons described using the method of cyclic γ-spectrometric analysis of the radiation of unseparated FP mixtures. (8 refs.)

65300 Linear momentum transfer selectivity in ^{12}C induced reactions at intermediate energy (30-60 MeV/u). S.Song, M.F.Rivet, J.Galin, B.Borderie, R.Bimbot, I.Forest, D.Gardes, B.Gatty, D.Guerreau, M.Lefort, H.Oeschler, B.Tamain, X.Tarrago (Inst. de Phys. Nucleaire, Orsay, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.93
The linear momenta transferred by ^{12}C projectiles to heavy targets (Au,U) have been determined at 30 and 60 MeV/u. For the U target it is expected that the heavy target residues deexcite mainly through the fission channel. It is well known that the distribution of the linear momentum of the fission fragments. For C+Au only one peak is observed, corresponding to rather central collisions; the average value of P_{ij}/P_{proj} goes down from 2/3 to 1/2 when the energy is increased from 30 to 60 MeV/u. For C+U a drastic broadening of the momentum distribution is observed as the residues from peripheral collisions ($P \lesssim 1$ GeV/c) also undergo fission, due to their lower fission barrier. (3 refs.)

65301 Angular momentum transfer and alignment following preequilibrium α-emission in heavy-ion reactions. H.Utsunomiya, T.Nomura, S.Kohmoto, S.Sasagase (Inst. of Phys. & Chem. Res., Saitama, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.94
The magnitude (I) and alignment (P_{zz}) of the transferred angular momentum are reported for preequilibrium α-particle emission in heavy-ion reactions. The present experiment was performed in order to investigate the projectile-dependence of I and P_{zz} in comparison with the authors' previous result (1981) obtained in ^{14}N-induced reaction. The authors have measured in-plane and out-of-plane angular correlations of fission fragments in coincidence with α-particles emitted in the reactions of ^{209}0Bi(^{20}Ne,αf) at 146 MeV. α particles were detected at 20° and 50° with respect to the beam direction. 25.88 FUSION REACTIONS

65302 The measurement of light particle emission from ^{12}C+^{159}Tb, Ag and ^{89}Y reactions. Dai Guang-xi, Jin Gen-ming, Yuan Shuang-qui, Guo Zhong-yan, Zeng Wen-bing, Chen Ju-sheng, Li Zu-yu, Wang Da-yan, Xu Guo-jun (Inst. of Modern Phys., Lanzhou, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.86-94 (Jan. 1983). In Chinese.
The energy spectra and angular distributions of α-particles emitted from ^{12}C-induced reactions with ^{159}Tb, Ag and ^{89}Y targets have been measured. Meanwhile the emitted deuteron's angular distributions with ^{159}Tb and ^{89}Y targets and proton's with ^{89}Y target have been also obtained. The α-energy spectra associated with the mentioned reactions have a bell-like shape with probable energy near coulomb barrier. However, the main characteristic of the α-angular distribution for ^{159}Tb and Ag targets is peaked at or near the grazing angles. For the case of ^{89}Y target, α-differential cross-sections monotonically decrease with angles beyond 40°. The angular distributions of protons and deuterons nearly decrease exponentially. In order to explain the anisotropic component of emitted α-particle, the authors propose incomplete fusion model with a strong-damped sticking rotation, in which the rotation angles and interaction time of the composite system are also estimated. (8 refs.)

65303 The onset of non-equilibrium phenomena in fusion-like processes for light heavy-ion systems. Y.Chan, M.Murphy, R.Stokstad, I.Tserruya, S.Wald (Lawrence Berkeley Lab., Berkeley, CA, USA), A.Budzanowski.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.100
The authors have measured the velocity distribution of evaporation residues produced in the reactions ^{16}O+Al, Ca and ^{60}Ni using oxygen beams of 8.8, 13.6 and 19.6 MeV/u from the LBL 88-Inch Cyclotron. The velocity, v, was obtained from the measured time of flight after corrections for energy losses in the target and start detector. Calibration of the absolute velocity scale was made by measuring the elastic scattering of 1.5 MeV/u ^{40}A ions from various targets. The centroid $\bar{v}$ of the reduced velocity spectrum, $N(v)/v^2$, was determined for each residue mass at each scattering angle θ by fitting a Gaussian function. The ratio $\bar{v}/V_{c.m.} \cos\theta$, where $eV_{c.m.}$ is the velocity of the center of mass, should equal unity provided there is complete momentum transfer and symmetry about 90° c.m. in the decay of the compound nucleus. They find that this ratio has little dependence on the residue mass and scattering angle. (2 refs.)

65304 A finite element method for neutron transport. VII. Completely boundary-free maximum principle for the first-order Boltzmann equation. R.T.Ackroyd (Northern Div., UKAEA, Risley, Warrington, England).
Ann. Nucl. Energy (GB), vol.10, no.5, p.243-61 (1983).
For pt.VI see ibid., vol.9, p.315 (1982). A completely boundary-free maximum principle for the first-order Boltzmann equation is derived from the completely boundary-free maximum principle for the mixed-parity Boltzmann equation. When continuity is imposed on the trial function for directions crossing interfaces the completely boundary-free-principle for the first-order Boltzmann equation reduces to a maximum principle previously established directly from first principles and indirectly by the Euler-Lagrange method. Present finite element methods for the first-order Boltzmann equation are based on a weighted-residual which permits the use of discontinuous trial functions. The new principle for the first-order equation can be used as a basis for finite-element methods with the same freedom boundary conditions as those based on the weighted-residual method. The extremum principle as the parent of the variationally-derived weighted-residual equations ensures their good behaviour. (12 refs.)

65305 Stability analysis of the neutron transport equation with temperature feedback. C.V.Pao (Dept. of Math., North Carolina State Univ., Raleigh, NC, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1321-5 (May 1983).
The author discusses the stability and instability of neutron transport in a reactor system where positive temperature feedback is taken into consideration. The feedback effect is considered only through the multiplication factor in the neutron transport equation. This consideration leads to a coupled system of nonlinear partial integrodifferential equations of neutron transport and heat conduction. The investigation of this coupled nonlinear initial boundary-value problem is based on the existence-comparison theorem established in an earlier paper in which an iterative scheme for the determination of the solution is given. It is shown that by constructing a suitable pair of the comparison functions, called upper and lower solutions, as two distinct initial iterations, the corresponding sequences converge monotonically from above and below, respectively, to a unique solution of the system. Under certain conditions on the multiplication factor, the property of upper and lower solutions determines the asymptotic behavior of the solution and leads to stability or instability of the system. A stability region for the zero steady state and an instability region of the system are also given. (7 refs.)

65306 Leakage of the gas of ultracold neutrons from a trap. A.V.Antonov, B.I.Goryachev, A.I.Isakov, N.V.Lin'kova.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.36-41 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.41-7 (1982).
The Monte Carlo method is used to obtain the temporal distributions (leakage spectra) of monoenergetic ultracold neutrons leaking from a trap. Methods are considered for the approximation of the leakage spectra. (6 refs.)

28.41 FISSION REACTOR THEORY AND DESIGN

65307 Density fluctuations in simple stochastic reactor models. M.A.Rodriguez (Dept. de Fisica Teorica, Univ. de Santander, Santander, Spain), M.San Miguel, J.M.Sancho.
Ann. Nucl. Energy (GB), vol.10, no.5, p.263-9 (1983).
The authors present a method to study density fluctuations in a nuclear reactor simultaneously taking into account intrinsic fluctuations usually modelled by a master equation and parametric noise usually modelled by stochastic kinetic equations. The mean density and density-fluctuations variance are calculated for a simple point-reactor model in the presence of Gaussian white-noise fluctuations in the fission, capture and source event rates. They are also calculated in the case of dichotomous noise fluctuations in the source event rate. They find 'crossed fluctuation' contributions to the density fluctuations that only appear when considering simultaneously intrinsic and parametric noise. These contributions allow one to distinguish between reactivity fluctuations due to fission-rate and capture-rate fluctuations. (18 refs.)

65308 Tight multilattices calculated by extended-cell cylindrization. M.Segev, S.Carmona (Dept. of Nuclear Engng., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
Ann. Nucl. Energy (GB), vol.10, no.5, p.271-6 (1983).
Among the common features of advanced LWR concepts are the tightness of lattices and the symbiotic setting of different fuels. Such symbioses often come in the form of multilattices, whose numerically-repeated unit is a configuration of several pins, typically with one pin type at the center and pins of a second type surrounding the center pin. If this extended-cell (EC) unit is cylindricized, then a simple transport calculation of the unit will be possible. If the lattice of such units is tight, there is further an a priori reason to expect the cylindrization to introduce only a small distortion of the true neutron fluxes in the lattice. A strict numerical validation of the EC cylindrization approximation is impractical, but similar validations can be carried out for regular lattices, viewed as being made up of multicell units whose centers are moderators and whose peripheries are fuel pins. In these comparisons the EC cylindrization approximation gives good results. (6 refs.)

65309 Exact solutions of two point time correlations on point reactor kinetics with Gaussian reactivity fluctuations. M.A.Rodriguez, L.Pesquera (Dept. de Fisica Teorica, Univ. de Santander, Santander, Spain).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.174-6 (Feb. 1983).
The authors extend the exact solution for the mean stationary value of a point reactor with Gaussian reactivity fluctuations derived by Saito (1980), to variances and two point time correlations. They study these functions for all possible values of the Gaussian noise correlation time. (8 refs.)

65310 Suboptimal control of large scale linear quadratic problems using time-scale decomposition. H.Kando (Center of Information Processing Education, Nagoya Inst. of Technol., Nagoya, Japan).
Large Scale Syst.-Theory & Appl. (Netherlands), vol.4, no.1, p.1-25 (Feb. 1983).
Using time-scale decomposition techniques, the design procedure for large scale dynamical systems with quadratic cost is presented. First, the fixed endpoint problem is studied, and secondly, and free endpoint problem is investigated. Furthermore, performance degradation of a suboptimally controlled system is examined. Finally, in order to illustrate this method, the numerical example applied to a nuclear reactor control problem is given. (56 refs.)

65311 Numerical treatment of the cladding mechanics in the fuel rod computer code IAMBUS. G.West (INTERATOM, Gladbach, Germany).
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.25-9 (Jan. 1983).
IAMBUS (*I*NTER*A*TOM *M*odel for *B*urn-*U*p *S*tudies on fuel Rods) is a digital computer code for the thermal and mechanical design, in-pile performance prediction and post-irradiation analysis of fuel rods. The mechanical analysis of the cladding is approximated by a state of generalized plane strain. The analysis includes routines for plasticity, creep and swelling due to void nucleation and growth. The numerical integration of these equations is described in detail and the accuracy of the results is discussed. (2 refs.)

65312 A review of flow-induced vibrations in reactors and reactor components. M.P.Paidoussis (Dept. of Mech. Engng., McGill Univ., Montreal, Quebec, Canada).
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.31-60 (Jan. 1983).
The author presents a review of two classes of vibration problems encountered in reactors and reactor peripherals: namely, vibration of cylindrical structures induced by cross flow and by axial flow. A historical perspective is given in which the milestone contributions that have advanced the state of the art are highlighted. Recent developments in the last three years are discussed, concluding with an assessment of the fluidelastic mechanisms involved, and the predictive tools available. (240 refs.)

65313 Dynamic response of a SDOF elastic-plastic system subjected to aircraft impact pulses. G.Meder (Brown, Boveri & Cie, AG, Mannheim, Germany).
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.61-74 (Jan. 1983).
The author studies the responses of elastic-plastic systems subjected to aircraft impact pulses. The results are compared with simpler pulse models and represented in the useful form of design charts. Two well-known approaches to seismic spectra are examined for the design of aircraft impact spectra. (9 refs.)

65314 Curve fitting to defect size distributions for the calculation of failure probabilities. A.Bruckner (Kernforschungszentrum, Arbeitsgruppe Zwerlassigkeit und Schadenskunde im Maschinenbau, Inst. fur Reaktorbauelemente, Karlsruhe, Germany), D.Munz.
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.75-8 (Jan. 1983).
The imperfection size distribution of pipe welds reported by Raussi and Tiainen (1980) is analysed. A lognormal distribution and a Weibull distribution are shown to be compatible with the data. (4 refs.)

65315 Laminar flow induced deflections of stacked plates. S.J.Pavone (General Electric Co., Schenectady, NY, USA), H.A.Scarton.
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.79-98 (Jan. 1983).
Some research and power reactors have core designs which consist of parallel, flat or curved plate fuel assemblies. The fuel is contained in the thin plates which are separated by narrow channels through which coolant flows. Since the plates are flexible, the coolant flowing through the channels causes the plates to deflect. At high coolant velocities large deflections have been observed causing the plates to deform plastically leading to structural failure or plate collapse. The authors examine a single plate bounded by two channels and determine the static plate deflection as a function of plate, channel and flow parameters. (14 refs.)

65316 Calculations of hydrogen detonations in nuclear containments by the random choice method. M.A.Delichatsios, M.B.Genadry.
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.117-26 (Jan. 1983).
Computer codes were developed for the prediction of pressure histories at different points of a nuclear containment wall due to postulated internal hydrogen detonations. These pressure histories are required to assess the structural response of a nuclear containment to hydrogen detonations. The compressible flow equations including detonation, which was treated as a sharp fluid discontinuity, were solved by the random choice method which reproduces maximum pressures and discontinuities sharply. The computer codes were validated by calculating pressure profiles and maximum wall pressures for plane and spherical geometries and comparing the results with exact solutions. The two-dimensional axisymmetric program was used to calculate wall pressure histories in an actual nuclear containment. The numerical results for wall pressures are presented in a dimensionless form, which allows their use for different combinations of hydrogen concentration, and initial conditions. (15 refs.)

65317 Comparison analysis of the reliability and efficiency of nuclear power station units with one and two turbogenerator sets. I.Ya.Emel'yanov, A.I.Klemin, Yu.I.Koryakin, V.S.Emel'yanov, N.A.Trekhova.
Sov. At. Energy (USA), vol.53, no.2, p.515-19 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.67-70 (Aug. 1982). [received: April 1983]
The authors compare the reliability and efficiency of nuclear power stations operating with either one or two turbogenerator units. They use a complex index equal to the ratio of the average output at failure to the average time of emergency repair. (12 refs.)

65318 Operating efficiency of steam separators in power plants with RBMK reactors. V.B.Karasev, Yu.M.Nikitin, O.Yu.Novosel'skii, E.V.Sakovich.
Sov. At. Energy (USA), vol.53, no.2, p.519-25 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.70-4 (Aug. 1982). [received: April 1983]
The drum steam separators in a multiple forced circulation circuit are analysed for their reliability and efficiency with RBMK reactors. (3 refs.)

65319 Quasilinear approximation in the statistical analysis of the simplest nonlinear dynamic model of a power reactor. Yu.V.Volkov, A.G.Kostromin, V.K.Nazarov.

Sov. At. Energy (USA), vol.53, no.2, p.555-8 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.103-5 (Aug. 1982). [received: April 1983]

In the statistical analysis of dynamic properties, and also in estimating the thermotechnical reliability of power reactors, it is necessary to know the probabilistic characteristics of their power. The basic characteristics are the one- and two-dimensional laws of power and reactivity distribution, and also the first two moments of these distributions. The authors present a complete statistical analysis of the simplest nonlinear dynamic model conducted in the quasilinear approximation for exponentially correlated fluctuations of the reactivity. (3 refs.)

65320 Problems in summarizing experimental data on the heat-transfer crisis in boiling. Yu.V.Mironov, S.V.Shpanskii.

Sov. At. Energy (USA), vol.53, no.2, p.567-9 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.110-11 (Aug. 1982). [received: April 1983]

The heat-transfer crisis is one of the main thermophysical factors that restrict increased specific power in nuclear-power systems. Therefore, there are many experimental studies on the crisis, and extensive experimental evidence has been accumulated. Much attention has recently been given to the physical essence of the process. This has provided a reasonably sound qualitative picture that indicates how the individual parameters influence the process. However, at present it is impossible to predict the crisis reliably on the basis of a detailed description of the hydrodynamics of the flow in a channel with fuel-rod elements. A decisive role in thermophysical calculations is assigned to semiempirical models and to correlations derived from statistical processing of the experimental data. The authors present some of the difficulties involved with processing the experimental data. (6 refs.)

65321 Temperature coefficients for global stability in a reactor with two-temperature feedback. R.S.Poddar, M.S.Trasi (Theoretical Reactor Phys. Section, Bhabha Atomic Res. Centre, Bombay, India).

Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.164-79 (March 1983).

The non-linear stability of a nuclear reactor system with two-temperature feedback has been analysed. Using Welton's criterion as well as Liapounov's second method, it has been shown that if the delayed temperature coefficient lies between certain limits of opposite signs, the system will be globally and asymptotically stable. It has also been proved that the region of global stability in the parametric plane of temperature coefficient of reactivity, obtained from Welton's criterion, curtains that obtained from Liapounov's second method with a Liapounov function used in this work. (12 refs.)

65322 Multivariable control in nuclear power stations: Order reduction. M.Parent, P.D.McMorran.

Report AECL-7245, Atomic Energy Canada Ltd., Chalk River, Ont. (Dec. 1982), v+34 pp.

Linear, state-space models of power plant systems tend to be of high order, leading to difficulties in the design of control systems by state-space methods. However, the control system has access only to the plant inputs and outputs, and the fast-responding internal variables may be masked by slower, dominant variables. Model order reduction applies modal analysis to eliminate the fast modes while retaining the character of the input-output response. Two alternative techniques are presented and demonstrated on a model of a nuclear steam generator. The preferred method is implemented in MVPACK, the computer-aided design package. (8 refs.)

65323 A simulator for the Superphenix 1 nuclear power plant. J.C.Bluet, C.Fourcade, J.C.Quinton (Cadarache, CEN, Saint-Paul-Lez-Durance, France).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.86-8 vol.4

The authors report on a simulator mainly devoted to training of operators working at the Superphenix plant, which is the industrial prototype of the French breeder program. After they recall the main features of the plant, they describe the various and specific aspects of this simulator: the physical-mathematical model, the training desk, and the data processing realization. (no refs.)

65324 Advanced safety code CATHARE summary of verification studies on 'separate effect' experiments. J.C.Rousseau, G.Houdayer (Service des Transferts Thermiques, CENG, Grenoble, France).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.343-51 vol.1

The CATHARE code is developed for the analysis of pressurized water reactor accidents. A one-dimensional two phase-two fluid model is used. The authors describe the constitutive laws introduced in this model, concerning interfacial momentum and mass transfers. All these correlations are issued from an analysis of 'separate effect' experiments belonging to the experimental CATHARE verification program. These experiments were specially developed to study all the flow regimes of importance for nuclear safety analysis. (21 refs.)

65325 TRAC-PF1 choked-flow model. M.S.Sahota, J.F.Lime (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.480-6 vol.1

The two-phase, two-component choked-flow model implemented in the latest version of the transient Reactor Analysis Code (TRAC-PF1) was developed from first principles using the characteristic analysis approach. The subcooled choked-flow model in TRAC-PF1 is a modified form of the Burnell model. The authors discuss these choked-flow models and their implementation in TRAC-PF1. Comparisons using the TRAC-PF1 choked-flow models are made with the Burnell model for subcooled flow and with the homogeneous-equilibrium model (HEM) for two-phase flow. These comparisons agree well under homogeneous conditions. Generally good agreements have been obtained between the TRAC-PF1 results from models using the choking criteria and those using a fine mesh (natural choking). Code-data comparisons between the separate-effects tests of the Marviken facility and the Edwards' blowdown experiment also are favorable. (10 refs.)

65326 The development of a nodal method for the stability analysis of ventilated boiling channels. R.Taleyarkhan, M.Podowski, R.T.Lahey,Jr. (Dept. of Nuclear Engng., Rensselaer Polytech. Inst., Troy, NY, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.487-97 vol.1

A mathematical model has been developed for the linear stability analyses of a system of ventilated parallel boiling channels. Various physical phenomena such as: phasic slip, nonuniform axial power distribution, distributed local losses, heater wall dynamics, radial power skews, turbulent mixing, and various donor-cell options, have been incorporated. The system of linearized, Laplace transformed nodal equations was integrated using an efficient numerical algorithm. A new matrix-reduction method, developed for this purpose is presented. (11 refs.)

65327 BODYFIT-2PE and its application to CHF prediction of GE 3×3 rod bundle. T.H.Chien, B.C.-J.Chen, W.T.Sha (Components Technol. Div., Argonne Nat. Lab., Argonne, IL, USA), J.H.Kim.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.498-507 vol.1

BODYFIT-2PE is a three-dimensional, steady-state/transient, single-phase/two-phase rod-bundle thermal-hydraulic computer program based on the technique of boundary-fitted coordinate system and partially elliptic approximation. It uses the homogeneous equilibrium model with algebraic slip to model the two-phase flow. Due to the use of the non-orthogonal coordinate system, a modified staggered-mesh arrangement is used where velocities are stored at intersections of grid lines and the enthalpy and pressure are stored at the center of the cells formed by the grid lines. The corresponding numerical method and the pressure correction scheme are presented. BODYFIT-2PE was used to calculate the critical heat flux of a GE 3×3 rod bundle. The calculations were compared with the experimental measurements in terms of average heat fluxes and boiling lengths at the occurrence of critical heat fluxes. (6 refs.)

65328 A method to determine transient critical power ratios for boiling water reactors. A.F.Ansari (Yankee Atomic Electric Co., Framingham, MA, USA), S.L.Forkner.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.508-18 vol.1

A method for the determination of fuel transient critical power ratios (CPRs) for boiling waaer reactors has been developed. This method is based on the RETRAN and TCP computer codes. The critical power ratio approach is used to describe the conditions at which a boiling transition from nucleate to film boiling occurs. Qualification of this method is provided through comparisons to transient boiling transition data. (5 refs.)

65329 Analysis of Westinghouse controlled transient heat transfer tests using the FAST code. H.A.Khater (Nuclear Products Dept., Westinghouse Canada Inc., Hamilton, Ontario, Canada), G.D.Raithby, M.Merilo.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.519-27 vol.1

FAST is a recently-developed numerical model for predicting one-dimensional, transient, thermal non-equilibrium two-phase flows, including the effect of heat conduction in the walls. The predictions of the FAST model are compared with measurements obtained from the Westinghouse J-Loop. In addition, the model has been used to predict the cross-sectional average flow conditions at the time and location of the first observed CHF, and the performance of several correlations used to predict CHF, including a new proposed one, are evaluated. (11 refs.)

65330 Reactor coolant model for a power plant operator's training simulator. P.Deshpande, P.Lu, K.Choung (Gould Simulation Systems Inc., Melville, NY, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.588-94 vol.1

The Reactor Coolant System (RCS) of Combustion Engineering System 80 Nuclear Power Plant for Washington Public Power Supply System Unit 3 is modeled for a real-time operator's training simulator using the SEL 32/77 computer. The RCS consists of a reactor vessel; two parallel heat transfer loops, each containing a U-tube steam generator and two reactor coolant pumps; and a pressurizer connecting to one of the reactor vessel outlet pipes. The pressurizer pressure and water level is calculated by considering the RCS, including the pressurizer, as a two-phase tank and using the overall mass conservation on the entire system. (2 refs.)

65331 Non-linear dynamic-impact simulation of process equipment tubes with tube/support plate interaction. R.G.Sauve, W.W.Teper (Nuclear Systems Dept., Ontario Hydro, Toronto, Ontario, Canada).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.740-51 vol.2

The occurrence of flow induced vibration fretting wear in process equipment such as heat exchangers and steam generators accounts for the majority of the failures due to vibration. One of the parameters which plays a vital role in the prediction of tube wear rate is the tube motion and resulting impact forces which occur when the tube response exceeds the clearance in the support plates and results in a collision. The impact and/or sliding forces which occur at interfaces lead to progressive thinning of tube walls and ultimate failure in the extreme case. (17 refs.)

65332 One-dimensional modeling of two-phase jet expansion and impingement. M.Epstein, R.Henry (Fauske & Associates Inc., Burr Ridge, IL, USA), W.Midvidy, R.Pauls.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.769-77 vol.2

A simple one-dimensional model of the free expansion of a highly underexpanded two-phase jet is formulated. The model is found to be in good agreement with available measurements of the center-line pressure decay in small- and large-scale free jet experiments. Moreover, it is demonstrated that existing measurements of the forces experienced by a target surface immersed in a two-phase jet are in reasonable agreement with standard type momentum balance formulations. (17 refs.)

65333 Fluid-structure interaction during LOCA blowdown. R.N.Oehlberg (Electric Power Res. Inst., Palo Alto, CA, USA), F.H.Chang, G.E.Santee,Jr., G.A.Mortensen, M.B.Gross, T.B.Belytschko.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.778-91 vol.2

A methodology for realistically analyzing three-dimensional fluid-structure interaction effects and the resulting hydrodynamic loads during the subcooled portion of a hypothetical loss-of-coolant accident in a pressurized water reactor is discussed. The methodology uses a hydrodynamic computer program, STEALTH 3D, coupled with a structural response program, WHAMSE 3D, to calculate the dynamic interaction of fluid and structure during a reactor vessel blowdown. This coupled program is user oriented and highly versatile in modeling the various components in complex reactor systems. Assessment of the methodology is provided by STEALTH/WHAMSE 3D calculations of blowdown tests in the German Battelle-Frankfurt RS-16B facility (Test DWR5) and the HDR facility (Tests V31.1 and V32). The calculations are described and the results compared with experimental data. Agreement between the calculational results and experimental data is good. (19 refs.)

65334 Flow-induced fatigue failure of structures. A sensitivity analysis. H.Fenech, A.Rao (Dept. of Chem. & Nuclear Engng., Univ. of California, Santa Barbara, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.792-802 vol.2
Several flow noise pressure power spectra are considered to determine the fatigue lifetime of a plate simply supported on all sides. These spectra are typical of far field turbulent flow, vortex shedding, circulation noise and flow impingement. Elasticity theory and the linear damage accumulation model are the basis of this analysis. Narrow band, broad band and resonance models are successively used in the lifetime prediction. The sensitivity of the fatigue lifetime of the plate on the input pressure power spectrum representation, the material properties, the damping factor, the amplitude and peak frequency of a narrow band noise is presented. (14 refs.)

65335 A figure-of-eight thermosyphoning stability model and its verification. P.Gulshani (Atomic Energy of Canada Ltd., Mississauga, Ontario, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.840-8
A simple, linearized, one dimensional stability model of the flow oscillations observed in the RD-12 thermalhydraulic experimental rig is developed starting from the basic equations governing a homogeneous two-phase flow. This rig has the so-called figure-of-eight geometry similar to but simplified from that of a CANDU reactor. The flow oscillations are explained in terms of the two-phase fluid pressure oscillations and enthalpy transport delays and a general stability criterion is given. The predicted and observed periods and damping ratios are found to be generally in good agreement. Combined with a simple, analytic, steady-state model for the loop to determine approximate operating conditions, the stability model is used to generate stability maps for thermosyphoning conditions. (1 ref.)

28.42 FISSION REACTOR MATERIALS

65336 Plate vs. rod fuel elements in a tight-lattice water reactor. Y.Ronen, A.Sharon (Dept. of Nuclear Engng., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
Ann. Nucl. Energy (GB), vol.10, no.5, p.277-80 (1983).
The possibility of using plate fuel elements in tight-lattice water reactors instead of rod fuel elements is explored. For this purpose the authors compared the thermal-hydraulic and neutronic aspects of plates with those of rod fuel elements. Because of the fact that plates have a higher mechanical strength than rods with equal dimensions, it is possible to reduce the thickness of the plates and thus reduce the centerline temperature. This fact and other thermal-hydraulic considerations demonstrate that plate fuel elements are safer than rods with respect to their resistance to LOCA. Preliminary neutronic calculations indicate that plates and rods have about the same neutronic characteristics. (22 refs.)

65337 Measurements of stresses, forces and moments on nuclear steam generators. M.T.Flaman, N.N.Shah (Dept. Mech. Res., Ontario Hydro Res. Div., Toronto, Ontario, Canada).
Exp. Mech. (USA), vol.23, no.1, p.10-14 (March 1983).
Regulator demands required that strain-gage measurements be made on a steam drum/steam generator assembly to ensure that ASME code limits would not be exceeded during operation. The major difficulty in the performance of this measurement project was centered primarily on the lack of accurate information on the thermal-expansion behavior of the components to be instrumented. In addition, another difficulty in the performance of the measurements was the effect of unknown through-wall thermally induced stresses on the strain-gage readings. To overcome these significant obstacles, an unconventional measurement approach was developed for the analysis of strain-gage measurements. This approach enabled known information on internal steam-generator steam pressure to be substituted for the unknown information (as described above) which is usually required for strain-gage analysis. This approach has been successfully verified and may have widespread applicability for other measurement projects which face the same commonly encountered difficulties. (4 refs.)

65338 The effect of composition and radiation on the fracture of a nuclear waste glass. J.L.Routbort, H.Matzke (Comm. of the European Communities, European Inst. for Transuranium Elements, Karlsruhe, Germany).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.229-37 (April 1983).
The Hertzian indentation technique has been used to determine the surface fracture energy γ_F and the fracture toughness K_{Ic} of a borosilicate glass (Versuchsglas type 98/12) developed to contain high level nuclear waste. Using spherical steel indenters whose radii were varied between 1.5 and 7.0 mm, the critical load P_c for crack formation was determined. P_c is a linear function of the indenter radius which does not pass through the origin. This failure of Auerbach's law may be due to the statistical nature of the flaw distribution. Nevertheless, the data are used to estimate that $K_{Ic}=1.77\pm0.15$ MN $m^{-3/2}$. Adding selected groups of fission products to the base glass leaves K_{Ic} unchanged. The addition of lead to the glass or bombardment with 300 keV lead ions lowers K_{Ic} by approximately 20%. This may be due to replacement of Si-O bonds by Pb-O bonds which are weaker. Radiation with 77 MeV α particles to a dose of 1.3×10^{15} α particles cm^{-2} increases K_{Ic} by approximately 75%. It is concluded that neither the radiation used here nor the simulated fission products will seriously degrade the fracture properties of the nuclear waste glass investigated. (19 refs.)

65339 One-dimensional problems of temperature and heat flux determination at the surfaces of a thermoelastic slab. I. The analytical solutions. K.Grysa, Z.Kozlowski (Tech. Univ. of Poznan, Poznan, Poland).
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.1-14 (Jan. 1983).
The authors approximate analytical and exact solutions of the problems of heat flux and temperature determination on slabs. The problems are considered on the ground of the theory of thermoelasticity. The interior thermal and mechanical responses are used in determining the unknown functions describing heat flux and temperature of the surface of a slab. (11 refs.)

65340 One-dimensional problems of temperature and heat flux determination at the surfaces of a thermoelastic slab. II. Numerical analysis. Z.Kozlowski, K.Grysa (Tech. Univ. of Poznan, Poznan, Poland).
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.15-24 (Jan. 1983).
For pt.I see ibid., vol.74, p.1-14 (1982). The authors present a thorough analysis of an identification process that has been analytically described in the first part. The conclusions have shown some new aspects of the problem and are confirmed by brief additional analytical considerations. (1 ref.)

65341 Modeling heat and mass transfer in the core of a heat-emitting fuel element. V.A.Kornilov, V.D.Yuditskii.
Sov. At. Energy (USA), vol.53, no.2, p.525-8 (Aug. 1982). Translation of: *At. Energ. (USSR),* vol.53, no.2, p.74-6 (Aug. 1982). [received: April 1983]
By the method of computer modeling, the heat and mass transfer of oxide fuel in a cylindrical heat-emitting fuel element is investigated, with exhaust of the gaseous fission products through a gas flue in the form of a central tube. The mathematical formulation of the nonsteady three-dimensional problem of heat and mass transfer in a fuel element as a problem for a multicomponent system of bodies with moving phase boundaries is given. (4 refs.)

65342 Nuclear reactivity of extractors with a variation in the concentration of fissionable materials in a nonsteady regime. T.Zoltowski (Inst. of Nuclear Res., Warsaw, Poland).
Sov. At. Energy (USA), vol.53, no.2, p.540-3 (Aug. 1982). Translation of: *At. Energ. (USSR),* vol.53, no.2, p.86-8 (Aug. 1982). [received: April 1983]
The criticality of extraction units has important significance. The extraction process performed in a multistage device (in the counterflow) is highly nonlinear; therefore, it is accurate to describe the phenomena occurring in the unit as very complicated. The distribution and variation of the concentration in the individual stages of the device depend on the initial parameters; the plutonium concentration in the aqueous phase can be subjected to the greatest perturbation. A device for the extraction of a large amount of fissionable materials cannot always have absolutely safe geometry. In this connection, control of the criticality of the device is directly related to control of the concentration distribution in the stages of the device. The appearance of nonuniformity in the distribution of fissionable materials in an extraction can result in too large an increase in the nuclear reactivity of the system. A.M. Rozen et al. (1979) have calculated the profiles of the plutonium concentration and determined the conditions under which a peak in the plutonium concentration is created in a steady-state or transitional process. They assume that this can lead to a critical state. The author checks the postulate of Rozen et al. and determines the variations of the reactivity when a critical concentration profile is attained. (7 refs.)

65343 Buildup of ^{233}U with a specified content of ^{232}U by the irradiation of thorium in a water-cooled/water-moderated reactor (VVER). A.A.Polyakov, V.P.Rukhlo, Yu.E.Titarenko, S.F.Komin.
Sov. At. Energy (USA), vol.53, no.2, p.561-2 (Aug. 1982). Translation of: *At. Energ. (USSR),* vol.53, no.2, p.106-7 (Aug. 1982). [received: April 1983]
When thorium is irradiated in reactors, it is necessary to reduce the buildup of ^{232}U with respect to ^{233}U. A reduction of $N^{232}U/N^{233}$ can be achieved by inserting certain inert diluents into the thorium rods. Based on an analysis of the nuclear-physics and technological properties, zirconium dioxide was chosen as such an inert diluent. A detailed investigation of the effect of a different concentration of ZrO_2 in ThO_2 rods on the formation of ^{233}U and the determination of the ratio of the concentrations $N^{232}U/N^{233}U$ was conducted on a subcritical uranium—water test-rig, for which the neutron source was the IRT reactor. (4 refs.)

65344 The behaviour of gaseous and organic impurities in the coolant of a nuclear power station with channel type uranium-graphite boiling reactors. V.A.Mamet, N.I.Bogdanov, V.F.Tyapkov, V.A.Yurmanov, G.A.Andropova, A.V.Arkhipenko, S.F.Erpyleva.
Therm. Eng. (GB), vol.29, no.7, p.364-7 (July 1982). Translation of: *Teploenergetika (USSR),* vol.29, no.7, p.14-17 (July 1982). [received: Feb. 1983]
The ratio of radiolytic gases (H_2 and O_2) in the steam is found to differ from the stoichiometric values. The most probable cause is the admission of ion-exchange resins or their decomposition products and oils. Acid compounds predominate owing to thermoradiolysis of organic materials. (7 refs.)

65345 The effect of the products of decomposition of ion exchange resins on the pH of the coolant of a boiling reactor. V.Ya.Bredikhin, L.N.Moskvin.
Therm. Eng. (GB), vol.29, no.7, p.368-70 (July 1982). Translation of: *Teploenergetika (USSR),* vol.29, no.7, p.17-19 (July 1982). [received: Feb. 1983]
To forecast the nature of disturbances to water-chemistry conditions of a station with an RMBK-1000 reactor with entry of ion exchange resins into the multistage forced circulation circuit, investigations were carried out on an experimental reactor of boiling type. The findings are discussed. (13 refs.)

65346 Optical probe for steam generator tube dent measurement. D.L.Oberg.
Report EPRI-NP-2863, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 56 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
This report documents one of a series of projects to develop nondestructive examination methods, focusing on a check for denting at the intersection of the tube and the tube support plate. The design of an optical profilometer to measure tube denting and the construction of prototype and field-hardened devices are detailed.

65347 Examination of tube samples 21-46 and 28-45 from the Ginna Nuclear Plant for intergranular attack. L.W.Sarver, E.B.S.Pardue.
Report EPRI-NP-2877, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 274 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
Details the destructive examination of tubes pulled from the Ginna nuclear power plant to characterize intergranular attack. The metallurgical and deposit chemistry data obtained from the samples are discussed, and the mechanisms of action of the suspect substances are discussed.

65348 Twenty-six-inch pipe NDE instrument surveillance test. R.L.Bickford, R.A.Clark, S.L.Crawford, J.F.Dawson, S.R.Doctor, P.H.Swift.
Report EPRI-NP-2869, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 122 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
This report describes the initiation and growth of intergranular stress corrosion cracking in the weld-heat-affected zone of a pipe specimen. Tests on a 26-inch-diameter type-304 stainless steel pipe exposed to high-purity oxygenated water and subjected to a sustained axial stress are detailed. Use of these tests in developing nondestructive examination techniques to detect and monitor cracking is discussed in terms of various methods including dye penetrant, ultrasonic, radiography, electrical resistivity, gauging, and acoustic emission.

65349 Nondestructive evaluation program: Progress in 1982. G.J.Dau, A.Armor, M.E.Lapides, S.N.Liu, T.Oldberg, J.R.Quinn.
Report EPRI-NP-2728-SR, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 458 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
A comprehensive review of the EPRI nondestructive evaluation program, including contractor-supplied progress reports of each current project grouped by plant components, is presented. An organizational plan of the program is summarized from the viewpoints of in-service inspection operations, R&D personnel, and utility representatives. This report also serves as the proceedings for the EPRI nondestructive evaluation information meeting that was held in Charlotte, North Carolina, on November 2-3, 1982.

65350 Verification of core-fuel inventory of a fast critical facility by monitoring reactor physics parameters. M.Obu, K.Koyama, H.Kuroi.
Report JAERI-M-82-153, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 26 pp.
On the safeguards problem, the technical feasibility was studied for experimentally verifying the core-fuel inventory of a fast critical facility. The FCA Assembly VIII-1 with a plutonium-fuelled test zone was used for this

purpose. Six loading patterns were chosen in the verification experiment to simulate the diversion of Pu-fuel from the core. The Pu-fuel removed from the core was about 3.5-5.8 kg. Verification techniques are based on the monitoring of small changes in fission rates and β/l caused by the diversion of some amount of Pu-fuel. The fission rates were measured by a fission chamber technique with a hundred ^{239}Pu fission chambers located in the core region and multi-chamber scanning electronics, while β/l values were measured by power noise analysis with two helium-3 chambers. The verification experiment indicates that the fission rates and β/l monitor follow the quantities of plutonium removed from the core. It is concluded that the verification of core-fuel inventory is feasible using the present monitoring method. (3 refs.)

65351 Final report on thw UKAEA defect detection trials on test pieces 3 and 4. December 1982. D.L.Lock, K.J.Cowburn.
Report ND-R-912(R), UKAEA, Risley, Lancs., England (March 1983), 51 pp.
This report follows ND-R-845(R) which described the scope, inspection procedures and results of the defect detection trials on test pieces 3 and 4. The work has been aimed at assessing the ability of non-destructive testing techniques, to detect and size defects near the clad/base metal interface of a flat plate test piece and the inner radius of a PWR inlet nozzle. Following the destructive examination of the test pieces at Ispra, the true sizes of the intended defects are now known. These sizes are compared with that intended and the performance of the inspection teams reviewed. (3 refs.)

65352 Low-level radwaste solidification. R.F.Tucker,Jr., R.A.Nelson, C.C.Miller.
Report EPRI-NP-2900, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 226 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
State-of-the-art low-level radwaste solidification processes and systems currently in use and under development are assessed. Types of waste, solidification agents, and general criteria affecting radwaste solidification technologies are identified; chemistry and physics of the processes are discussed; and technical descriptions of 22 commercially available solidification systems, information on radwaste packaging efficiencies for specific wastes, and descriptions of radwaste shipping and burial containers along with container handling and storage systems are provided.

65353 The use of asymptotic expansions to determine the short- and long-term leaching behaviors of nuclear waste forms. C.Pescatore, A.J.Machiels (Univ. of Illinois, Urbana, IL, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.283-5, vol.2
Several mathematical models have been formulated to describe leaching of nuclear waste forms. Given a model which can be rather elaborate, the use of asymptotic analysis allows one to extract with relative ease the short-term leaching behavior—well documented by laboratory experiments—as well as the long-term leaching behavior not directly verifiable by experimentation. The usefulness of the technique is limited by the requirement that the model to analyze be properly linearized. (10 refs.)

65354 Thermomechanical problems in nuclear waste using the explicit finite-difference method. R.Hofmann (Sci. Applications Inc., San Leandro, CA, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.286-7, vol.2
Discusses Lagrange explicit finite-difference (LEFD) techniques which are among several distinctly different approaches that are being used for solving complex, thermomechanical response waste isolation problems. The main attributes of the LEFD techniques are their ability to handle large and small strains, constitutive nonlinearities, and both quasi-static and transient response. The STEALTH computer code system developed for the Electric Power Research Institute, is the most advanced LEFD code available for solving a variety of thermomechanical nuclear waste problems. (10 refs.)

65355 Application of systems variability analysis to assess environmental impacts in the Canadian nuclear fuel waste management program. T.H.Andres (Whiteshell Nuclear Res. Establ., AECL, Pinawa, Manitoba, Canada).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.291-1a, vol.2
Atomic Energy of Canada Ltd. has recently embarked on a 10-year generic research program to assess the concept of geologic disposal of nuclear fuel wastes. It is necessary to know what impact disposal would have on future generations. It is not possible to predict exactly what would happen to buried wastes; however, it is hoped that it is possible to describe, in a statistical sense, what could happen due to natural processes. That is, to associate a probability with each level of impact that could occur. The procedure used to estimate such probabilities is called System Variability Analysis, currently performed using a computer program called SYVAC. (no refs.)

65356 UK developments in structural integrity aspects of NDT. A.Rogerson, P.J.Highmore (UKAEA, Risley, England).
8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.7/1-32
Considerable advances have been made in the field of ultrasonic nondestructive testing over the past few years. Some of these developments are reviewed in the context of the safe operation of a UK pressurised water reactor (PWR) by ensuring the structural integrity of the reactor pressure vessel (RPV). (27 refs.)

65357 Some aspects of work in the UK relating to PWR structural integrity. B.J.Darlaston (Berkeley Nuclear Labs., CEGB, Berkeley, England).
8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.20/1-27
Until recently much of the effort on structural integrity has been focussed on the pressure vessel. Although this is a key component many of the restraints on the vessel are related to the postulation of failure of other components in the primary pressure boundary, for example, loop pipe failure. More recently it has been recognised that the pressure vessel does not, by exemption, remove the need for attention to be paid to other components. The steam generator, loop pipework, pump, valves, pressuriser, surgeline and main steamline all have their interesting facets. One vital issue relating to much of the research work undertaken in the field of structural mechanics is the need for validation of an assessment procedure or technique. It is in this respect there is an element of dependence on overseas programmes particularly those in the USA sponsored by EPRI, NRC and DOE and in Germany at KWU and MPA. These programmes are continually reviewed in the light of the UK needs. (15 refs.)

65358 The susceptibility of SA-508-II and SA-533B to reheat cracking-evaluation of empirical and theoretical predictive methods. P.S.Ayres, S.B.Abston (Babcock & Wilcox, Cleveland, OH, USA), D.Bieber, W.Schellhammer.
8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.21/1-33
Presents the results obtained in a program for which the primary objective was to evaluate various empirical and theoretical methods for predicting reheat cracking [i.e., stress relief cracking (SRC)] in commercial size heats of nuclear pressure vessel steels of the SA-508-II and SA-533B types. The approach taken was to use theoretical predictive methods to select both crack-susceptible and non-crack-susceptible heats from archive materials of commercial heats of material used in nuclear vessel construction. The program then carried out an extensive experimental evaluation of these heats of material using both a production submerged arc (austenitic) cladding process and a production submerged arc (ferritic) structural welding process; these two processes exposed the materials to differing degrees of restraint (stress) and welding heat input. Included in this experimental evaluation was complete metallographic characterization of each heat of material, with particular attention being given to regions exhibiting cracking. (6 refs.)

65359 An experimental comparison of alternative solid forms for Savannah River high-level wastes. J.A.Stone (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.1-8
Samples of borosilicate glass, high-silica glass, tailored ceramic, and SYNROC, incorporating simulated Savannah River high-level defense waste sludges, were leached by the MCC-1 procedure for times up to 28 days. Cesium, uranium, and cerium leach rates are reported for waste forms containing a composite sludge, at 40°C in deionized water, and at 90°C in deionized water, silicate water, and brine. The ordering of the waste forms from best to worst differs for each element leached, and none of the forms show a clear advantage for all the key radwaste elements. Some cesium leach rates for forms containing high-aluminum or high-iron sludges also are presented. So far, only small effects of sludge type have been observed, with one exception. This study is one of several inputs for selection of an alternative waste form for Savannah River waste. (11 refs.)

65360 Processing effects on the behavior of titanate waste forms in aqueous solutions. R.G.Dosch (Sandia Nat. Labs., Albuquerque, NM, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.15-22
Titanate processing parameters including temperature, waste loading, redox conditions, and additives used to promote specific phases were evaluated with respect to their effect on leaching of Cs, Mo, Ca, Sr, Ba, U, Gd, and Ti in the range of 22°-150°C in leachates which included deionized water, acidic (pH 2), and basic (pH 12) solutions. Surface analyses and microstructural characterization were used to relate observed leaching behavior to processing parameters. Redox conditions were found to be very important with respect to Cs (and Mo) retention. Two Cs-bearing phases were found in titanate prepared under oxidizing conditions. One had a hollandite structure and the other contained Cs, Mo, Ca, and Fe as major constituents. The latter phase, which was more susceptible to leaching, was not observed in titanates prepared using adequate reducing conditions. Where applicable, a reference glass (PNL 76-68) was included in the leaching tests. (10 refs.)

65361 Iron-enriched basalt for containment of nuclear wastes. J.M.Welch, R.P.Schuman, C.W.Sill, P.V.Kelsey,Jr., S.P.Henslee, R.L.Tallman, R.M.Horton, D.E.Owen, J.E.Flinn (EG&G Idaho Inc., Idaho Falls, ID, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.23-30
Iron-enriched basalt (IEB) has been investigated as a containment medium for defense transuranic (TRU) and defense high-level wastes. IEB samples have been fabricated incorporating simulated and actual defense TRU wastes generated at the Rocky Flats Plant, and simulated defense high-level wastes. These samples were tested for leaching resistance and fracture toughness. Cesium and strontium volatility from an IEB melt was also assessed, using radioactively spiked samples. (8 refs.)

65362 Studies of pollucite. E.R.Vance, B.E.Scheetz, M.W.Barnes, B.J.Bodnar (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.31-5
Pollucite ($CsAlSi_2O_6$) has been suggested as a suitable phase for the incorporation and immobilization of ^{137}Cs, on the basis of its refractory nature and leach resistance. The phase also occurs in tailored ceramic formulations designed for the disposal of commercial reprocessing waste and zeolites which are heavily loaded with Cs. Pollucite itself occurs in nature as a mineral. The Cs is held in 12-fold coordination in a zeolite-like aluminosilicate framework. Other alkalis may be present, though H_2O molecules must be incorporated if Na or K is present. The present work addresses several aspects which may be relevant to the use of pollucite in nuclear waste management and which have not been dealt with in much detail by other workers. These aspects are (i) possible range of stoichiometry at high temperatures, (ii) incorporation of cations other than Cs, Al or Si, (iii) compatibility with other phases occurring in tailored-ceramic formulations, (iv) crystallization kinetics and possible sintering aids, (v) radiation damage response, (vi) transmutation stability and (vii) compatibility with cements. (18 refs.)

65363 Immobilization of Savannah River high-level wastes in SYNROC: results from product performance tests. J.H.Campbell, C.L.Hoenig, F.Bazan, F.J.Ryerson, R.Rozsa (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.49-57
Large samples (up to 15 cm diameter) of SYNROC D containing simulated Savannah River waste sludge have been prepared and performance tested.

Waste loadings of 60-65 wt.% for the SRL composite sludge have been achieved; this corresponds to a waste concentration (volumetric) loading of approximately 2.3-2.5 g/cm^3. A typical SYNROC D sample has a density of about 4.0 g/cm^3 with less than 0.2% porosity. The compressive and flexural strengths of SYNROC D are 51200 and 9400 psi, respectively and Young's Modulus is 20.1×10^6 psi by ultrasonic measurement. The quantity of respirable fines (less than 10 μm) generated during a constant energy density impact (10 J/cm^3) was less than 0.16 wt.%. Values for the thermal conductivity (22°C) and the thermal expansion coefficient (22-950°C) were measured to be 1.7 W/m.K and 11×10^{-6} K^{-1}, respectively. Normalized elemental leach rates determined by 28-day MCC-1 tests (90°C) for Cs, Sr, U and Nd are 0.7, 0.3, 5×10^{-5} and $<8\times10^{-3}$ g/m^2.d, respectively. (15 refs.)

65364 The application of ^{57}Fe Mossbauer spectroscopy to the characterization of nuclear waste forms. P.G.Huray, M.T.Spaar, S.E.Nave, J.M.Legan (Phys. Dept., Univ. of Tennessee, Knoxville, TN, USA), L.A.Boatner, M.M.Abraham.
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.59-66
The electronic charge states and site symmetries of the radioactive ions incorporated in nuclear waste forms are of considerable importance in determining the physical and chemical properties of these materials. An in situ characterization of these ions is, unfortunately, often difficult—especially when a mixture of charge states and local crystal symmetries exist. The application of Mossbauer spectroscopy represents a powerful technique for obtaining solid state chemical information. The Mossbauer isotope ^{57}Fe has been employed in examining the fractions of these nuclei present in mixed atomic environments in a variety of waste forms. The effects of heat treatment at various temperatures, reducing atmospheres, and diverse preparation procedures, were investigated. In many cases a comparison of the resulting spectra with the spectra of well-characterized compounds permitted a quantitative stoichiometric identification to be made of a fraction of the Mossbauer nuclei. In some instances only the charge states and local crystal distortions could be determined. (3 refs.)

65365 XPS valence state determination of Np and Pu in multicomponent borosilicate glass and application to leached 76-68 waste glass surfaces. D.P.Karim, D.J.Lam, H.Diamond, A.M.Friedman (Argonne Nat. Lab., Argonne, IL, USA), D.G.Coles, F.Bazan, G.L.McVay.
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.67-73
Current plans for high-level radioactive waste disposal call for long term emplacement of canisters of a suitably leach resistant waste form in deep underground repositories. The present study involves the use of X-ray photoemission spectroscopy (XPS) to examine the behavior of actinides at the surface of glasses. XPS is an inherently surface sensitive technique, probing the use to provide quantitative compositional information by monitoring the intensity outermost 20-30 Å of a sample. The technique is routinely used to provide quantitative compositional information by monitoring the intensity of photoemitted electrons from core levels characteristic of specific elements as a sample is illuminated with monochromatic X-rays. In some cases, small changes in the binding energies of these core levels (chemical shifts) can be used to get specific information on the environments and chemical states of ions in a solid. Prior to this study, little work has been done to establish procedures for determining Np or Pu oxidation states in silicate glasses from XPS spectra. Based on experience with U^{+4} and U^{+6} in glasses, the authors hoped that chemical shifts of the Np and Pu 4f core lines would provide convenient signatures for the respective actinide oxidation states. (7 refs.)

65366 Immobilization of high level nuclear reactor wastes in SYNROC: a current appraisal. V.M.Oversby, A.E.Ringwood (Res. School of Earth Sci., Australian Nat. Univ., Canberra, Australia).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.75-81
Results are presented for leach testing at 95°C and 200°C of SYNROC containing 9% and 20% simulated high level radioactive waste, synthetic hollandite and perovskite samples, and natural zirconolite and perovskite samples. Single phase synthetic minerals show much higher leach rates than natural mineral samples and polyphase SYNROC samples. Natural zirconolite samples with low radiation damage have leach rates at 200°C based on U which are identical to those measured on SYNROC samples. Natural zirconolites with very large accumulated α dose and radiation damage have leach rates at 200°C which are only 5 times higher than those of low dose samples. (7 refs.)

65367 Rutherford backscattering investigation of the corrosion of borosilicate glass. B.C.Sales, L.A.Boatner, H.Naramoto, C.W.White (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.83-90
One of the primary reservations about the use of borosilicate glass as a primary nuclear waste form is the leaching of radionuclides from the glass by water above 75°C. To study this process, examination of the surface layer is necessary. The technique of depth profile analysis by means of Rutherford backscattering has been used to study the evolution of the leaching process and associated changes in chemical composition of the leached borosilicate glass surface layer. (9 refs.)

65368 The development and testing of SYNROC C as a high level nuclear waste form. K.D.Reeve, D.M.Levins, E.J.Ramm, J.L.Woolfrey, W.J.Buykx (Australian Atomic Energy Comm. Res. Establ., Sutherland, Australia).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.99-106
The current status of SYNROC C research and development by the Australian Atomic Energy Commission is reviewed. A non-radioactive fabrication demonstration line designed to produce 10 cm o.d., 90 cm long, cylinders of SYNROC canned in stainless steel by the method of in-can hot pressing is being commissioned. Leach tests are proving the excellent leach resistance of SYNROC. Accelerated radiation damage testing using fast neutrons has simulated storage times of up to 6.7×10^5 years. Thermophysical properties of SYNROC have been measured over the temperature range 20-650°C. (14 refs.)

65369 Immersion and leach tests on solidified decontamination wastes from Dresden Unit 1. R.E.Barletta, J.W.Adams, R.E.Davis (Nuclear Waste Management Div., Brookhaven Nat. Lab., Upton, NY, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.141-6
In order to provide technical support to the NRC, Brookhaven National Laboratory has performed leach tests and immersion tests using organic liquids and organic saturated water of concentrated decontamination waste solidified using a vinyl ester-styrene binder. Immersion tests of waste forms prepared at a solidification demonstration held at the Dresden Nuclear Power Station were conducted in toluene, xylene, and water saturated with toluene and xylene. (4 refs.)

65370 Stability of I and Sr radiophases in cement matrices. M.W.Barnes, B.E.Scheetz, L.D.Wakeley, S.D.Atkinson, D.M.Roy (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.147-54
This study is a portion of a comprehensive research program that is examining the stability of a variety of nuclear waste forms. In addition to the bulk waste forms, important individual radiophases are being studied to obtain a more complete understanding of the behavior of the components of complex multiphase radwaste systems. The stability of the strontium radiophase in supercalcine and an iodine-radiophase will be discussed. The strontium radiophase in this study was Sr-powellite and the iodine radiophase was I-sodalite. Each radiophase was incorporated into bulk compositionally adjusted portland and aluminate cements. Two processing variables were studied: curing at 60°C and warm pressing at 150°C and 345 MPa. Sr-powellite in portland cement leaches incongruently; a combination of dissolution and diffusion-controlled exchange of Ca for Sr is demonstrated. In the warm-pressed aluminate cement these reactions are masked by reactions with the curing cement. I-sodalite leaching data indicate dissolution, dominant at long times, combined with diffusion, dominant at short times. (9 refs.)

65371 The system $SrMoO_4$-$BaMoO_4$-$CaMoO_4$: compatibility relations, the implications for supercalcine ceramics. B.E.Scheetz, W.P.Freeborn, J.Pepin, W.B.White (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.155-62
The stability of a tailored ceramic waste form under hydrothermal conditions was the subject of several previous papers. This is a report of an attempt to experimentally determine the phase relations in the alkaline-earth molybdate (Ca, Sr, and Ba) and verify a previous interpretation. For this work, the authors prepared compositions throughout the ternary system and heated them at 1200°C for periods of 2 to 24 hours. The experimental products were characterized by X-ray diffraction and SEM/EDX examination. New, calcium-rich compositions are suggested for the scheelite-structure phases in the supercalcine-ceramics based upon the interpretation of data from this study. This observation forces a re-examination of the assumption concerning the partitioning of Sr and Ba amongst the phases in the supercalcine-ceramic. (14 refs.)

65372 Leaching studies of crystalline sodium phases in nuclear waste forms. E.R.Vance, T.Adl (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.163-71
The immobilization of non-radioactive Na in nuclear waste has not been given much attention. However, since Na compounds are normally very soluble, Na-bearing phases may render a waste form more susceptible to leaching of radionuclides. The Na-phases may incorporate radionuclides and also, leaching of soluble Na phases will increase the surface area of the waste form. The crystalline Na-bearing phases which might occur in tailored ceramic formulations for nuclear waste are nepheline, magnetoplumbite and sodalite-type materials. Other Na phases which might occur in titanate-tailored or titanate-encapsulated forms are perovskite, $Na_2Ti_3O_7$ (especially in titanate-encapsulated materials) and Na_2TisiO or $Na_2Ti_2Si_2O_9$, etc., if the waste contained sand or zeolites. Sphene is of interest since it should be resistant to silica-rich ground water and it also can contain Na. Acmite is an alteration product of hydrothermally-treated PNL-76-68 glass. Na-bearing phosphates may occur in phosphate-tailored ceramics designed to immobilize transuranics in monazite. The present work concerns the reaction of the above materials with aqueous media in the temperature range 25-300°C. The phosphates studied were $NaTi_2(PO_4)_3$ and $NaZr_2(PO_4)_3$ which are relatively insoluble in boiling water. Other materials studied were $NaFeO_2$, Na_2ZrSiO_5 and $Na_2ZrSi_2O_7$. (23 refs.)

65373 Lanthanide orthophosphates as a matrix for solidified radioactive defense and reactor wastes. M.Petek, M.M.Abraham, L.A.Boatner (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.181-6
Previous investigations have shown that the lanthanide orthophosphates (i.e. analogs of the mineral monazite) are promising candidate waste forms for the storage of high-level actinide or TRU wastes. In the present work, the properties of lanthanide orthophosphates loaded with simulated Savannah River defense wastes and simulated reprocessed light water reactor wastes have been investigated with the goal of evaluating the potential of these materials as advanced primary waste forms. (4 refs.)

65374 The use of ^{222}Rn as a flow path monitor for studies of radionuclide transport in fissures. J.Hines, D.Cohen, S.Fried, A.M.Friedman (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.187-9
A technique has been developed using ^{222}Rn as a flow path monitor. Its principle advantage over other radiotracers or dyes is that while the Kd of Rn gas in water solution is zero and hence follows the water path, its ^{210}Pb daughter is retained strongly by rock. The immobilized ^{210}Pb is not subject to diffusion, an important consideration in the proposed Nevada Field Test. To evaluate the technique, a series of laboratory scale experiments have been

performed. Artificial fissures consisting of glass plates and prepared flat surfaces were coupled to insure well characterized fissures. Water solutions of radiotracer were metered through these fissures and the discharge monitored to produce breakthrough curves as a function of flow rate. The rock surfaces were analysed for radionuclide concentration and the rock sectioned for diffusion profile into the rock. (no refs.)

65375 Formation and properties of americium colloids in aqueous systems. U.Olofsson, B.Allard, K.Andersson, B.Torstenfelt (Dept. of Nuclear Chem., Chalmers Univ. of Technol., Goteborg, Sweden).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.191-8

The formation and sorption properties of colloidal americium in aqueous solutions have been studied with variations of pH (2-12), ionic strength (0.01-1.0 M $NaClO_4$), americium concentration (10^{-7}-10^{-11} M) and storage time (6 h-6 months). A large fraction of the americium is sorbed on the container walls or on Al_2O_3 in the pH range 7-11. Around pH 5-8 and at pH above 12 centrifugable fractions (particle sizes greater than 100 nm) are obtained. The fractions formed at pH above 12, which seems to be a true hydroxide colloid, migrates through an Al_2O_3-filled column with very little retention. The average charge of americium species in solution changes from positive values at pH below 7-8 to negative values at pH above 10-11, as indicated from electromigration studies. (6 refs.)

65376 Site characterisation for field radionuclide migration studies in Climax granite. D.Isherwood, E.Raber, R.Stone (Lawrence Livermore Nat. Lab., Livermore, CA, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.199-206

Radionuclide migration experiments in fractured granite at the Climax Stock, Nevada Test Site, are needed to compare field and laboratory measured retardation factors to determine whether laboratory studies accurately reflect in situ conditions. Initial field activities have concentrated on hydrological investigations to determine whether the fractures in Climax granite are suitable for migration experiments. A critical question was whether one could isolate a single vertical fracture between two boreholes and establish flow along that fracture from an upper to a lower borehole. In two fractures, the authors were able to establish a circulating system with up to 95 percent of the injected water being recovered. Constant pressure injection tests were conducted. Intrinsic permeabilities of 33 and 75 $(\mu m)^2$ were estimated using a radial non-steady flow model. These values correspond to effective fracture apertures of 20 and 30 μm respectively. Concurrent with the hydraulic testing activities is a study of the Climax ground-water chemistry. This paper includes the results of the hydrogeological and geochemical investigations, and describes the overall experimental design plans for the radionuclide migration experiments. (9 refs.)

65377 Nuclide migration field experiments in tuff, G tunnel, Nevada Test Site. B.R.Erdal, R.S.Rundberg, W.R.Daniels, K.Wolfsberg (Los Alamos Nat. Lab., Los Alamos, NM, USA), A.M.Friedman, S.Fried, J.J.Hines.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.207-13

A project to begin to address the phenomena of flow and element migration in fractured porous rock has recently been started by the Los Alamos National Laboratory, Sandia National Laboratories, and Argonne National Laboratory. The work has three objectives: (1) to develop the experimental, instrumental, and safety techniques necessary to conduct controlled, small-scale, radionuclide migration, field experiments; (2) to use these techniques to define radionuclide migration through rock by performing generic, at-depth experiments under closely controlled conditions in a single fracture in porous rock; and (3) to determine whether available lithologic, geochemical, and hydraulic properties together with existing or developed transport models are sufficient and appropriate to describe real field conditions (i.e. to scale from small-scale laboratory studies to bench-size studies to field studies). The detailed scope of this project and its current status are described. (9 refs.)

65378 Predicting Pu concentrations in solutions contacting geologic materials. R.G.Strickert, D.Rai (Pacific Northwest Lab., Richland, WA, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.215-21

Knowledge of Pu solid phases present in nuclear wastes is important for predicting the geochemical behaviour of Pu. Thermodynamic data and experimental measurements using discrete Pu compounds, Pu-doped borosilicate glasses (simulating a high-level waste form), and Pu contaminated sediments suggest that $PuO_2(c)$ is very stable and is expected to be present in the repository. The solubility of the stable phase, such as $PuO_2(c)$, can be used to predict the maximum Pu concentration in solutions for long-term safety assessment of nuclear waste repositories. (11 refs.)

65379 Transient hydraulic tests in granite: fissured porous medium analysis and results. J.H.Black, J.A.Barker (Inst. of Geological Sci., Harwell Lab., Harwell, England).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.223-30

Slug and pulse tests have been used extensively to measure the hydraulic conductivity and specific storage of granitic rocks. After several hundred tests using an IGS design of straddle packer test equipment, it became clear that the conventional methods of test analysis were inadequate. The straddle packer equipment developed by IGS allows the time scale of a test to be altered without repositioning the packers so that a range of tests can be carried out on the same test interval. The new analysis procedure presented here uses a model of fissured rock which incorporates water movement in both the fissures and the rock matrix. A new variable is introduced which includes the parameters matrix hydraulic conductivity, matrix specific storage, fissure specific storage and fissure hydraulic conductivity together with the controllable variables, effective casing radius and packer interval length. Examples of analysis using multiple tests in the same interval are presented together with the apparent relationship between measured hydraulic conductivity and specific storage. It would appear that a small number of fissures endow the rock mass with the bulk of its hydraulic conductivity and that many of the higher hydraulic conductivity tests are probably associated with localised 'pipe flow'. (8 refs.)

65380 A natural analogue for storage of radwaste in crystalline rocks. D.G.Brookins, M.S.Abashian (Dept. of Geology, Univ. New Mexico, Albuquerque, NM, USA), L.H.Cohen, H.A.Wollenberg,Jr..

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.231-8

The Bryan-Eldora stock (Colorado) intruded the Precambrian Idaho Springs Formation metamorphic rocks 58 million years ago. Geochronologic-geochemical work by Hart et al. (1968) has demonstrated that the heat from the cooling intrusive rocks was sufficient to affect mineral isotopic systematics up to 2000 m from the contact, and the nature of these isotopic perturbations can be explained by a simple diffusion model in turn based on various heat flow models. The new studies are focussed on elemental exchange between stock and intruded rock as a function of distance from the contact; the assumption is made that the stock is a very large, high heat source analogous to a waste form emplaced in the metamorphic rocks without the benefit of canister or engineered backfill. Data for U, Th and the REE indicate actinide and lanthanide immobility except perhaps in the 0-2 m contact zone where some infiltration of the country rocks by stock-derived fluids occurred. Beyond 4 m no stock-derived U, Th, REE or *Pb are noted. Further, whole rock Rb-Sr and stable O isotopic data indicate conductive cooling as opposed to convective, water-induced cooling. The intruded rocks possess low porosity and permeability; this helped prevent elemental migration during the 10^5-10^6 years of stock crystallisation. The petrographic and geochemical studies show that the Idaho Springs (or equivalent) metamorphic rocks are well suited for radwaste storage. (7 refs.)

65381 Radionuclide migration: laboratory experiments with isolated fractures. R.S.Rundberg, J.L.Thompson, S.Maestas (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.239-48

Laboratory experiments examining flow and element migration in rocks containing isolated fractures have been initiated at the Los Alamos National Laboratory. Techniques are being developed to establish simple fracture flow systems which are appropriate to models using analytical solutions to the matrix diffusion-flow equations. These experiments are intended to be intermediate steps toward larger scale field experiments where it may become more difficult to establish and control the parameters important to nuclide migration in fractured media. Laboratory experiments have been run on fractures ranging in size from 1 to 20 cm in length. The hydraulic flow in these fractures was studied to provide the effective apertures. Traced solutions containing ^{85}Sr and ^{137}Cs were flowed through fractures in Climax Stock granite and welded tuff (Bullfrog and Tram members, Yucca Mountain, Nevada Test Site). The results of the elutions through granite agree with the matrix diffusion calculations based on independent measurements of K_d. The results of the elutions through tuff, however, agree only if the K_d values used in the calculations are lower than the K_d values measured using a batch technique. This trend has been previously observed in chromatographic column experiments with tuff. (6 refs.)

65382 Zirconolites from Sri Lanka, South Africa and Brazil. R.C.Ewing, R.F.Haaker (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA), T.J.Headley, P.F.Hlava.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.249-56

Zirconolites, $CaZrTi_2O_7$, from Sri Lanka and Pala Bora, South Africa, and a calzirtite, $CaZr_3TiO_9$, from Jacupiranga, Brazil, were examined using the electron microprobe, X-ray diffraction (annealing study), transmission electron microscopy, scanning electron microscopy and optical microscopy. The X-ray data indicate that all three zirconolites are metamict. Both Sri Lanka zirconolites are amorphous to the limits of resolution of the electron microscope ($\sim$10 A). The Pala Bora zirconolite is largely amorphous but contains isolated domains (50-200 A) of crystalline material which may be the result of post-metamict recrystallisation and alteration. The only other significant evidence for chemical alteration was the lower Th concentration (1-2 weight percent) and slightly lower analytic totals for the rims of the Sri Lanka zirconolites. Upon annealing at 1130°C for 5 hours, all three zirconolites recrystallised as microcrystalline aggregates. Both Sri Lanka zirconolites contain microvoids, spherical in shape, and 200 Angstroms to 2 microns in size. This porosity may be the result of helium accumulation arising from the decay of U and Th. The calzirtite was highly crystalline, exhibited no porosity, and was unchanged by the annealing treatment. (13 refs.)

65383 Study of polyhalite from the WIPP site, New Mexico. D.G.Brookins (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.257-64

Polyhalite ($K_2Ca_2Mg(SO_4).2H_2O$) is an important mineral present in the bedded evaporites of the WIPP site, southeastern New Mexico. Polyhalite contains two structurally bonded water molecules, and it is thus important to know if this mineral formed at or close to the time of sedimentation or more or less continuously throughout the Mesozoic and Cenozoic. If formed much later than original evaporite formation, then this implies a new source of water in order for polyhalite to form in turn raising questions about water abundance and mobility in the bedded evaporites. Polyhalite is not well suited for Rb-Sr geochronologic study because of the large amounts of common Sr, but it has been shown to be suitable for study by the K-Ar geochronologic methods. Pure polyhalites and those mixed with very small amounts of impurities yield K-Ar dates in the range of 200-220 MYBP and indicate little if any, loss of ^{*40}Ar. Polyhalites mixed with sylvite, halite, and (Na,K)Cl yield lower ages due to loss of ^{*40}Ar from the halides. Apparent are lowering is proportional to halide content and an extrapolated age of formation of near 225 MYBP results. Collectively, the K-Ar data convincingly show that the polyhalites formed at the time of sedimentation (except for isolated occurrences near dike intrusions) in Late Permian time. Finally, thermodynamic calculations, supported by petrographic study, show that polyhalite is often stable with respect to carnallite, sylvite and other minerals formerly thought to be older than polyhalite. (13 refs.)

65384 Uranium-lead radiometric age determinations of naturally occurring U(VI) minerals: application to radwaste storage. D.G.Brookins (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.265-71
U(VI) bearing species are commonly formed under oxidising laboratory rock-water-HLW experimental conditions. The experimental stability of artificially produced Na-Cs-Rb weeksite (alkali uranyl hydrosilicate), and other U(VI) species, is uncertain. Naturally occurring U(VI) bearing minerals (uranophane and tyuyamunite) from the Grants mineral belt, New Mexico, have been studied for their U-Pb systematics as natural analogues to these experimentally produced phases. Samples from highly oxidised rocks and from chemically reducing environments have been studied. The samples from oxidised rocks are mixed with hematite-barite-gypsum-calcite gangue and are close to, but not in contact with, pyritiferous-organic carbon-uraniferous (U(IV))-chloritic ore. The reduced rock uranophane yields nearly concordant ^{238}U-^{206}Pb and ^{234}U-^{207}Pb ages of 8.32 and 8.33 MYBP (millions of years before the present); the oxidised rock uranophane and tyuyamunite yield more discordant ages ($n=8$) between 7.4 and 2.7 MYBP. These data argue for long range stability of U(VI)-rich phases in the geologic environment. (12 refs.)

65385 Diffusion of neptunyl(V)- and pertechnetate ions in marine sediments. F.Schreiner, S.Fried, A.Friedman (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.273-7
The diffusion of the $^{235}NpO_2{}^+$ and $^{95m}TcO_4{}^-$-ions has been measured directly in sample cylinders of two different sediments from the floor of the deep sea. In smectite-rich sediment not shielded from contact with atmospheric oxygen the following values were obtained for the effective diffusion coefficients of neptunyl-and pertechnetate-ions, respectively: $D_{eff}(NpO_2{}^+)=1.5\times10^{-12}$ m^2 s^{-1} and $D_{eff}(TcO_4{}^-)=3.2\times10^{-10}$ m^2 s^{-1}. Under anoxic conditions in sediment with known reducing properties, the pertechnetate ion appears to undergo slow reduction and the effective diffusion coefficient of the reduced species of D_{eff}(Tc, red)$=1.1\times10^{14}$ m^2 s^{-1} reflects a substantial decrease of the mobility of the lower-valent technetium. (1 ref.)

65386 Radiogeological assessment of candidate sites for nuclear waste repositories, exemplified by studies of the Stripa Pluton, Sweden. H.A.Wollenberg, S.Flexser, L.Andersson (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.279-86
Investigation of candidate sites for nuclear waste isolation will require an assessment of their radiogeologic settings. Studies at the Stripa research facility in granitic rock of central Sweden incorporated the distribution and abundance of naturally occurring radioelements in rocks encompassing the underground experiments and in the accompanying fracture-controlled groundwater system. These studies showed that besides defining the natural radioactivity baseline upon which the effects of radioactive waste will be superimposed, radioelement distributions can be used to determine the apparent age of the groundwater and its flow paths. In crystalline rocks, where the groundwater systems are confined to the joints and fractures, the uranium daughter element, radon-222 in the water serves as a natural tracer to locate fractures along which significant flow is occurring and to measure the flow rates. The heat production from radioactive decay of uranium-238, thorium-232 and potassium-40 in the rock, combined with measurements of regional and local geothermal heat flow, permit calculation of the apparent size of the rock mass that will encompass the repository. This method is especially useful in terrains such as at Stripa where the contacts between plutons and older rocks are concealed. (6 refs.)

65387 Predictions of radionuclide migration rates for a subseabed repository. L.H.Brush (Seabed Programs Div., Sandia Nat. Labs., Albuquerque, NM, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.287-94
Geochemical research carried out by the US Subseabed Disposal Program is described. Data from studies of high temperature interactions between sediments and porewater (seawater), and of sorption and diffusion of radionuclides in oxidised, deep-sea sediments are used, along with results from heat transfer studies, to predict migration rates of radionuclides in a subseabed repository. Preliminary results for most radionuclides in oxidised sediments are very encouraging: fission products with moderate values of K_D (generally 10 to 10 ml/g), and actinides with high values of K_D (generally 10^3 to 10^6 ml/g) would not migrate significant distances before decaying to innocuous concentrations. ^{137}Cs, ^{90}Sr, and ^{239}Pu are among this group. The results for anionic species are less encouraging, but preliminary work with reduced sediments indicates that Tc can be effectively isolated. Planning for a field verification of these laboratory and modelling studies is also described. (27 refs.)

65388 Diffusion measurements in compacted bentonite. B.Torstenfelt, K.Andersson, H.Kipatsi, B.Allard, U.Olofsson (Dept. of Nuclear Chem., Chalmers Univ. of Technol., Goteborg, Sweden).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.295-302
The diffusion of Cs, Sr, Am and Tc in compacted bentonite clay has been studied, using a diffusion cell where diffusion takes place axially from the centre of a cylinder of the clay. The effect of addition of potential radionuclide getters to the clay (apatite for Am, pyrite, olivine, and Fe(s) for Tc) as well as using complexed (acetate) or colloidal Am has been studied. The diffusivities obtained for Cs and Sr were very high-9.0×10^{-13} m^2/s and 2.6×10^{-12} m^2/s, considering that if the effect of sorption on the clay is subtracted the diffusivities would be 1.8×10^{-9} m^2/s and 3.1×10^{-8} m^2/s. These diffusivities are, however, maximum values as the concentration profiles do not follow the theoretical form for these nuclides. A small amount of the ions seems to migrate very fast, while the rest moves slower. For Tc, that may be expected to be anionic and thus poorly sorbed, a diffusivity of 5.3×10^{-11} m^2/s was obtained. Addition of Fe(s) decreases the diffusivity by one order of magnitude while olivine and pyrite have no measurable influence during the present contact times (2-3 months). Americium is practically immobile. (12 refs.)

65389 Migration rates of brine inclusions in single crystals of NaCl. I-Ming Chou (US Geological Survey, Reston, VA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.303-10
Rock-salt deposits have been considered as a possible medium for the permanent storage of high-level radioactive wastes and spent fuel. Brine inclusions present in natural salt can migrate toward the waste if the temperature and the temperature gradients in the vicinity of the radioactive waste are large enough. This migration is due to the dissolution of salt at the hot side of the salt-brine interface, ion diffusion through the brine droplet, and the precipitation of salt at the cold side to the salt brine interface. In order to quantify the problem, the migration rate of these brine inclusions must be estimated under various repository conditions. The author estimates migration rates for all-liquid brine inclusions in single crystals of NaCl by utilising recent data for brines and the model of Anthony and Cline (1971). The predictions are compared with experimentally measured migration rates. (27 refs.)

65390 Corrosion of construction materials in clay environments. J.Dresselaers, F.Casteels, H.Tas (SCK/CEN Studiecentrum voor Kernenergie, Booretang, Belgium).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.311-19
The corrosion rate and mechanism of construction materials of galleries and casings for boreholes (possibly to be used as consumable overpack of HLW canisters) have been evaluated after a first campaign of corrosion experiments in direct contact with clay, in a humid clay atmosphere and in a gas corrosion chamber. The envisaged construction material is ductile iron (grade 60) and has been tested with and without metallic and organic coatings. The corrosion mechanism is governed by the formation of a rust scale composed of Fe_3O_4 and C. Preferential attack underneath the surface reaction layer is associated with the progress of a reaction front at the interface between the graphic nodules or flakes and the ferritic of pearlitic structure. Post-corrosion analyses of old gray iron coal mine shafts exposed for 60 and 90 years in well defined conditions are included to validate the use of the results of the short-time tests for very long exposure times. (5 refs.)

65391 The dissolution of irradiated fuel under hydrothermal conditions. L.H.Johnson, H.H.Joling (Whiteshell Nuclear Res. Establ., AECL, Pinawa, Manitoba, Canada).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.321-7
Uranium dioxide, the major component of irradiated CANDU fuel, shows good hydrothermal stability under the appropriate redox conditions. The thermodynamic stability of UO_2 in low ionic strength granite groundwater at 150°C under oxidising and reducing conditions is briefly reviewed in order to provide a basis for discussion of the results of irradiated fuel dissolution experiments. Fuel chemistry characteristics that influence the kinetics of fission product release are also discussed. Experimental studies demonstrate the influence of redox chemistry on irradiated fuel dissolution behaviour. Under strongly reducing conditions, both uranium and ^{99}Tc concentrations in solution decrease to the detection limit, whereas appreciable concentrations of both elements accumulate under oxidising conditions. The release of some fission products, such as ^{90}Sr and ^{137}Cs, does not seem to be strongly affected by changes in redox chemistry. Under oxidising conditions, the rate of ^{90}Sr release to solution increases by a factor of ten to twenty between 25 and 150°C. (13 refs.)

65392 Permeability, swelling and radionuclide retardation properties of candidate backfill materials. J.H.Westsik,Jr., L.A.Bray, F.N.Hodges, E.J.Wheelwright (Pacific Northwest Lab., Richland, WA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.329-36
A backfill placed between a nuclear waste canister and the host geology of a nuclear waste repository can impede the migration of water through the waste package and retard the movement of radionuclides into the geologic formation. Hydraulic conductivities and swelling pressures are being determined as functions of the density of the compacted backfill, temperature, radiation dose, hydraulic head and the chemical composition of the permeating fluid. Bentonite clays and bentonite/sand mixtures have received initial emphasis. Sodium bentonite and calcium bentonite samples compacted to a dry density of 2.1 g/cm^3 had hydraulic conductivities in the range of 10^{-12} to 10^{-13} cm/s. In addition, batch distribution ratios (R_d) for Sr, Cs, Am, Np, I, U and Tc have been measured for a number of candidate backfill materials. Both initial permeability and sorption studies have used a synthetic basaltic ground water. (12 refs.)

65393 PNL-Sandia HLW package interactions test: phase one. M.A.Molecke (Sandia Nat. Labs., Albuquerque, NM, USA), D.J.Bradley, J.W.Shade.
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.337-45
The first phase of a complex high-level waste (HLW) package interactions test in a salt environment has been completed. The test system consisted of PNL 76-68 HLW glass (loaded with inactive fission products and ^{238}U) surrounded by a stainless steel waste canister, a TiCode-12 overpack, a bentonite/sand backfill, excess brine leachant, and a bedded rock salt container, all held within a 19-liter autoclave. All components were physically compromised in order to force wasteform-barrier-salt interactions to occur during this 95-day, 250°C overtest. Analyses of leachant, wasteform, and all barrier surfaces were performed. Test data included the synergistic effects between barriers and confirmed previous analyses of simpler systems. The glass wasteform exhibited some surface alteration but was not dissolved to any significant degree. The TiCode-12 overpack showed minimal uniform corrosion and no localized attack. Observed mineralogical alteration of the backfill was minimal. (8 refs.)

65394 Mechanisms of dissolution of radioactive waste storage glasses and caesium migration from a granite repository. N.A.Chapman, I.G.McKinley, D.Savage, J.M.West (Inst. of Geological Sci., Environmental Protection Unit, Harwell, England).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.347-54

Experimental and theoretical data are used to compare the effect of three possible leach mechanisms for borosilicate glass waste buried in a granite host-rock on the release and subsequent migration of ^{135}Cs. Protracted release episodes and variations of up to an order of magnitude in groundwater transport times and five orders in output concentrations are possible. (12 refs.)

65395 Degradation of rocks, through cracking caused by differential thermal expansion, in relation to nuclear waste repositories. J.R.McLaren, R.W.Davidge, I.Titchell (Materials Dev. Div., AERE Harwell, England), K.Sincock, A.Bromley.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.355-62

Heating to temperatures up to 500°C, gives a reduction in Young's modulus and increase in permeability of granitic rocks and it is likely that a major reason is grain boundary cracking. The cracking of grain boundary facets in polycrystalline multiphase materials showing anisotropic thermal expansion behaviour is controlled by several microstructural factors in addition to the intrinsic thermal and elastic properties. Of specific interest are the relative orientations of the two grains meeting at the facet, and the size of the facet; these factors thus introduce two statistical aspects to the problem and these are introduced to give quantitative data on crack density versus temperature. The theory is compared with experimental measurements of Young's modulus and permeability for various rocks as a function of temperature. There is good qualitative agreement, and the additional (mainly microstructural) data required for a quantitative comparison are defined. (8 refs.)

65396 Development of engineered structural barriers for nuclear waste packages. R.E.Westerman, S.G.Pitman, R.P.Elmore, J.L.Nelson (Pacific Northwest Lab., Richland, WA, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.363-70

The development of structural barriers for nuclear waste packages involves selection of candidate materials, their screening by mechanical and corrosion testing, rigorous accelerated testing, and evaluation and comparison with other package elements. This document presents results from work conducted on titanium and cast steels. (6 refs.)

65397 Experimental and theoretical analyses of small-scale radionuclide migration field experiments. K.L.Erickson, D.R.Fortney (Sandia Nat. Labs., Albuquerque, NM, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.371-8

Analyses have been completed which provide guidance for conducting radionuclide migration field experiments. Characterization of nonwelded tuffs and laboratory experiments defining dominant chemical phenomena were used to develop a model for describing migration in fractured porous rock. Criteria for obtaining optimum experimental conditions were developed in terms of the key variables dominating migration in a given rock type, namely the fracture aperture, distribution coefficient, and average fluid velocity. For simple dissolved species, which are reversibly sorbed, variations in fracture aperture and fluid velocity affect experiment results much more than variations in distribution coefficient. Therefore, the experiment should be designed to optimize hydrogeologic conditions rather than sorption properties. (7 refs.)

65398 Reference laboratory testing for backfill. R.M.Chung, F.Y.Yokel (NBS, Washington, DC, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.379-87

Relatively high magnitude of swelling and low hydraulic conductivity are two of the performance requirements for the backfill placed around the radioactive waste package for the underground nuclear waste storage scheme. Some studies have been conducted in US national laboratories and in other countries where the candidate backfill materials were tested under many different conditions to determine the expected range of these properties. The authors briefly examine the variables that were found to be significant in the evaluation of swelling and hydraulic conductivity and special emphasis is placed on the compaction method, compaction effort, and the moisture content at the time of compaction, which do not receive much consideration in ongoing test programs. (11 refs.)

65399 Strontium-basalt reactions under nuclear waste repository conditions. S.Komarneni (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.389-95

Hydrothermal interactions of Sr as strontium chloride or hydroxide with basalts or basalt phases were investigated at 300°C for 4 and/or 12 weeks under a confining pressure of 30MPa. The nature and extent of Sr immobilization varied with the Sr source and with the basalt or basalt phase which immobilized up to 99.99% of the added Sr. The main mechanism of Sr fixation with basalts seems to be ion exchange when $SrCl_2$ was the Sr source. Among the basalt phases, basalt glass was the most effective for $SrCl_2$ immobilization by probably forming new strontium mineral phases. However, when $Sr(OH)_2$ reacted with basalts or basalt phases Sr was immobilized by the crystallization of strontium aluminosilicates such as $SrAl_2Si_2O_8$. These results of Sr-near-field interactions in a basalt repository indicate that basalt can be a good barrier for Sr migration from nuclear wastes. (11 refs.)

65400 Backfill-waste interactions in repository simulating tests. N.Sasaki (Tokai Works, Power Reactor & Nuclear Fuel Dev. Corp., Ibaraki-ken, Japan), S.Komarneni, B.E.Scheetz, R.Roy.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.397-404

Candidate backfill materials such as montmorillonite and clinoptilolite with and without the presence of simulated nuclear waste solids such as borosilicate glass, glass ceramic, sintered ceramic and supercalcine ceramic were investigated under repository stimulating conditions (=300°C and 30 MPa). Experiments were conducted under semi-wet as well as wet repository conditions. Reactions of backfill materials with simulated wastes and immobilized waste elements such as Cs, Mo, etc. form new phases such as analcime, oligoclase and powellite. In fact, analyses of product solutions from interaction runs indicated that the presence of backfill materials during the alteration of waste solids served to drastically reduce the concentration of some radionuclides in solutions. These results suggest that properly selected backfills can provide the simplest and most effective chemical (or thermodynamic) engineered barrier in an intelligently designed multibarrier system. (13 refs.)

65401 Alpha decay self-damage in cubic and monoclinic zirconolite. F.W.Clinard,Jr., C.C.Land, D.E.Peterson, D.L.Rohr, R.B.Roof (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.405-12

Samples of primarily-monoclinic ^{238}Pu-doped zirconolite were stored at ambient temperature to allow accumulation of alpha decay self-damage to a dose of 6×10^{24} α/m^3 (equivalent to a SYNROC age of $\sim10^3$y). Bulk swelling reached 2.3 vol% with no tendency toward saturation, a damage response similar to that observed for cubic Pu-doped zirconolite. X-ray volumetric swelling at 4×10^{24} α/m^3 was 1 vol%, considerably less than that for the cubic material. Changes in cell dimensions differed significantly from those reported by others for a monoclinic natural mineral. Extensive microcracking was observed, and is attributed at least partially to swelling differences between the matrix and minor phases. (16 refs.)

65402 Chemical, physical and engineering characterization of candidate backfill clays and clay admixtures for a nuclear waste respository. I. S.K.Singh (Materials Res. Lab. Ltd., Nepean, Ontario, Canada).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.413-32

Fourteen Canadian clays and clay admixtures were subjected to simulated nuclear waste repository environments. The present work is concerned with the montmorillonite-dominant materials only. The montmorillonite-dominant samples showed significant leaching on interaction with deionized water. On heating the samples at 200°C for 500 hours, montmorillonites lost intermicellar water completely and acquired cusp-like to cylindrical morphologies. The loss of water and the morphological changes in montmorillonites significantly altered the engineering characteristics. Permeability, shrinkage limits, compactability and shear strength varied in response to the dominant exchange cation in the structure of montmorillonites and the presence of other mineral components in the materials. The synthetic granite water reacted with montmorillonites and led to changes in chemical and mineralogical compositions, crystalline state and engineering properties. (1 ref.)

65403 Radiation induced sodium metal colloid formation in natural rock salt from different geological localities. J.M.Loman, P.W.Levy, K.J.Swyler (Brookhaven Nat. Lab., Upton, NY, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.433-40

Radiation damage has been studied in natural rock salt from various localities, including potential repository sites. In the 100 to 300°C range the damage consists of point defects, primarily F-centers, and colloidal metal sodium particles. With increasing dose the F-centres grow to a saturation level, reached at 10^7-10^8 rad, that decreases with increasing temperature to a negligible level at 300°C. Colloid concentration vs. irradiation-time curves follow nucleation and growth curves accurately described by $C\ t^n$, or $C(\mathrm{dose})^n$, relations at large irradiation times. For fourteen samples, $n=1.85\pm0.18$ but the values of C vary by a factor of more than 10^3. The constant C is related to the sample strain, the impurity and void content, dose rate, and possibly other factors. The currently available data indicate that rock salt adjacent to radioactive waste canisters, at a temperature of 150°C, will contain between 0.01 and 10 mole percent of sodium metal when the total dose reaches 10^{10} rad. (6 refs.)

65404 Novel experiments for understanding the shallow land burial of low-level radioactive wastes. G.L.DePoorter, T.E.Hakonson (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.441-7

Data on the basic processes that occur in the shallow land burial of low-level radioactive wastes are needed to engineer facilities with guaranteed performance, to validate models for system predictions, and to provide input to models that consider contaminant pathways out of the facility. Two types of novel experiments that will provide experimental data on the basic processes in shallow land burial facilities are described. Generic experiments that give data on the movement of water and radionuclides and an experiment that is particularly important for semi-arid sites are described. (13 refs.)

65405 Identification of possible high integrity containers for low-level nuclear waste disposal. J.D.Williams (Hittman Nuclear & Dev. Corp., Columbia, MD, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.449-55

Increased concern by the State of South Carolina over the condition and capacity of the low-level radioactive waste burial site at Barnwell has prompted them to promulgate new regulations on waste burial containers. As of September 30, 1981, ion exchange resin and filter media waste with an activity of 1 μCi/cc or greater and with isotopes with half-lives greater than five years disposed at Barnwell shall be solidified or confined in a 'high integrity container'. The materials and designs of these containers are required to provide waste isolation from the environment for a period of 300 years and provide the structural integrity specified in 49 CFR 173.398(b). HITTMAN has been active in the design and development of containers suitable for this purpose with this paper detailing the analyses involved. Material selections were limited to stainless steel, fiberglass, and polyethylenes. Structural concerns focused on overpressure requirements, drop-testing requirements, and lifting capabilities. With a lifetime dose. (7 refs.)

65406 Stochastic analysis of groundwater flow and contaminant transport in a fractured rock system. F.W.Schwartz, L.Smith, A.S.Crowe (Dept. of Geology, Univ. of Alberta, Edmonton, Alberta, Canada).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.457-63

It has been possible to develop a stochastic model for groundwater flow and mass transport in a fractured rock system. A large number of statistically independent realizations of a fracture network are generated from a set of probability distributions for parameters defining the fracture geometry. By solving for hydraulic head at the fracture intersections and using data on apertures and porosities, seepage velocities may be calculated and the transport equation solved for each trial of a Monte Carlo simulation. Model output consists of distributions of moving particles and various mass exit times. Applications illustrate the types of model results and the skewed character of particle distributions. (9 refs.)

65407 Solidification of radioactive wastes with thermosetting resin. M.Hayashi (Tokyo Electric Power Co., Tokyo, Japan), K.Kobayashi, O.Okamoto, T.Kagawa, K.Wakamatsu, H.Irie, H.Matsuura, K.Yasumura, Y.Nakayama.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.465-72

Dried simulated radioactive wastes were solidified with thermosetting resin and their properties were investigated with laboratory scale and real scale products through extensive testings, such as mechanical resistance, resistance to leaching and swelling in water, radiation resistance, fire resistance and resistance to temperature cycling. The typical results were as follows: over 600 kg/cm^2 of compressive strength, diffusion constant of $\sim 10^{-5}$ cm^2/day for ^{137}Cs leaching from solidified waste products, no significant change was found for up to 5×10^8 RAD irradiation, and damages were limited to the surface of the products after the thermal test and dropping impact test. (3 refs.)

65408 Nuclear waste disposal: the interface between performance assessment and research. R.B.Lyon (Whiteshell Nuclear Res. Establ., AECL, Pinawa, Manitoba, Canada).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.473-80

The potential impact of the post-closure phase of a nuclear fuel waste disposal project is radiation dose to man. Radiation dose is estimated as the end product of a total systems analysis. Field and laboratory research must be assimilated in a form that can be accepted by the total systems analysis procedure. A central focus of this assimilation must be the consideration of uncertainties in the analysis and data used. Irreducible uncertainty arises because of the wide variability in natural systems and the unprecedented extrapolation into the distant future. The SYVAC computer program provides a framework for assimilation of the results of the field and laboratory research with a systematic treatment of uncertainty. A SYVAC assessment of the post-closure performance of a Canadian nuclear waste disposal facility is presented with particular illustrations of the interface between the assessment models and data and the field and laboratory research. (17 refs.)

65409 Processing of titanates and zeolites and use of a cartridge system for 'reactor' wastes. S.Forberg, T.Westermark, K.Svardstrom, L.Falth (Dept. of Nuclear Chem., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.481-8

New methods were introduced in order to facilitate the production of (i) very coarse-grain pure mordenite at a large scale (ii) mono-disperse sodium titanate of a low price also at small volumes, and (iii) a composite ion exchanger with up to 20 W-% of mordenite in beads of sodium titantate. Zeolites and titanates were converted to ceramic bodies by hot isostatic pressing at 1300°C or by cold pressing followed by sintering at temperatures up to 1300°C. Processed materials were zeolites, titanates and mixtures of them. The mechanical properties of sintered titanates were inferior to the hot pressed ones. Diffraction studies, static leaching at 40°C and Soxhlet leach tests were performed. The leach rates were much higher for mixed materials than for pure ones. For the handling of inorganic ion exchangers through all processes from packing of inactive beds and immobilization of radioactive species to the sintering or hot pressing for final disposal a system of cartridges is suggested. A lay-out of the system is presented together with some special arguments and some practical experiences. Simple, safe and hygienic operations with an optimal use of the inorganic sorbents are expected to result from this system. (13 refs.)

65410 Performance of asphalt and clay liners as a uranium mill tailings leachate barrier. J.Buelt, S.Barnes (Pacific Northwest Lab., Richland, WA, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.489-96

Pacific Northwest Laboratory is evaluating the long-term effectiveness of various asphalt and clay liner materials as a radionuclide and process chemical barrier from uranium mill tailings. A field test is being conducted by monitoring asphalt and clay liners installed at the Grand Junction, Colorado tailings site. In addition eight prospective liners have undergone three months exposure to accelerated conditions to predict their behaviour over a 1000 year period. High calcium leachates have been forced through thin layers of clay to determine the ability of the clay to resist ion exchange, which reduces its swelling capabilities. Asphalt liners have been exposed to elevated temperatures and increased strengths of oxidising agents to acclerate their ageing process. The permeability coefficients measured during this exposure were then used to predict each liner's stability with time. The analyses thus far show that clay soils with bentonite amendments and most asphalt compositions have good long-term performance characteristics. (3 refs.)

65411 A comparative assessment of TRU waste forms and immobilisation processes. W.A.Ross, C.O.Harvey, R.O.Lokken, R.P.May, F.P.Roberts, C.L.Timmerman, R.L.Treat, J.H.Westsik,Jr. (Pacific Northwest Lab., Richland, WA, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.497-504

Six alternative TRU waste forms and seven waste immobilisation processes are comparatively assessed on the basis of both product properties and process costs and risks. The waste forms are characterised for their leachability, mechanical strength, and thermal and radiation stability. The processes are evaluated in terms of costs (for processing, transportation, and repository disposal) and in terms of occupational exposure, industrial hazard, and quality assurance. Cast cement is recommended for immobilisation of defence TRU wastes. A glass system, either borosilicate or aluminosilicate, is recommended for immobilisation of commercial TRU wastes. (5 refs.)

65412 Low-level waste disposal analysis. D.Ensminger, C.Koplik, S.Oston, M.Kaplan, J.Nalbandian.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.505-12

The safety of low-level radioactive waste disposal sites is analysed using the computer code LOTRAN. Radiation doses to off-site individuals and to future land reclaimers are computed for a generic disposal site located in a humid Eastern environment. The predicted doses are compared to illustrative performance criteria developed under this project. Results provide insight into those characteristics of low-level waste disposal systems most important to public safety and will allow analyses of tradeoffs among natural and engineering features. (8 refs.)

65413 Leaching studies of radionuclides from solidifed wastes with thermosetting resin. K.Suzuki, H.Kuribayashi (JGC Corp., Yokohama, Japan), W.Morimitsu, I.Ono.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.513-18

The author reports on studies of the leachability of Co-60 and Cs-137 from simulated LWR radwastes solidified with thermosetting resin and evaluates the effects of chemical fixation on leachability. It is concluded that insolubilisation by a nickel-ferrocyanide compound offers an effective chemical fixation of these radionuclides and is a recommended pretreating method for radwastes that are to be solidified. (5 refs.)

65414 Biological intrusion of low-level waste trench covers. T.E.Hakonson, E.S.Gladney (Environmental Sci. Group, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.519-23

The long-term integrity of low-level waste shallow land burial sites is dependent on the interaction of physical, chemical, and biological factors that modify the waste containment system. Past research on low-level waste shallow land burial methods has emphasised physical (i.e. water infiltration, soil erosion) and chemical (radionuclide leaching) processes that can cause waste site failure and subsequent radionuclide transport. The authors demonstrate the need to consider biological processes as being potentially important in reducing the integrity of waste burial site cover treatments. Plants and animals not only can transport radionuclides to the ground surface via root systems and soil excavated from the cover profile by animal burrowing activities, but they modify physical and chemical processes within the cover profile by changing the water infiltration rates, soil erosion rates and chemical composition of the soil. One approach to limiting biological intrusion through the waste cover is to apply a barrier within the profile to limit root and animal penetration with depth. Experiments in the Los Alamos Experimental Engineering Test Facility were initiated to develop and evaluate biological barriers that are effective in minimising intrusion into waste trenches. The experiments that are described employ four different candidate barrier materials of geologic origin. Experimental variables that will be evaluated, in addition to barrier type, are barrier depth and soil overburden depth. The rate of biological intrusion through the various barrier materials is being evaluated through the use of activatable stable tracers. (12 refs.)

65415 Immobilisation and leakage of krypton encapsulated in zeolite or glass. A.B.Christensen, J.A.del Debbio, D.A.Knecht, J.E.Tanner (Exxon Nuclear Idaho Co., Idaho Falls, ID, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.525-32

Krypton and other gases are readily absorbed in zeolite 5A molecular sieve or porous Vycor 'thirsty glass' and may be trapped there by sintering 2-4 hours at 700° or 900°C, respectively. Encapsulation in these materials is the basis of a method to 'immobilise' krypton-85 for storage. Amounts of gas trapped are approximately proportional to gas density, and are about 50 and 40 cc (standard conditions=STP)/cc of solid at 1000 atm, for zeolite 5A and glass, respectively. Based on tests of a few months duration a leakage of 0.3% of the krypton is predicted for 10 years at 400°C for either material. (8 refs.)

65416 Iron-enriched basalt and its application to Three-Mile Island radioactive waste disposal. P.V.Kelsey,Jr., R.P.Schumann, J.M.Welch, D.E.Owen, J.E.Flinn (EG&G Idaho Inc., Idaho Falls, ID, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.533-40

Demonstration tests were performed on iron-enriched basalt (IEB), a dissolution and immobilisation medium for TMI radioactive wastes. Zeolite of the type used for cesium and strontium decontamination of TMI containment water was mixed with 20 wt% additives and melted at 1500°C to form IEB. Cesium volatility from the IEB melts was low. Leaching tests in 90°C deionised water showed leach rates of 6 $\mu g/cm^2.d$ for both cesium and strontium. IEB melts were used to dissolve Type 304 SS pellets and UO_2 pellets clad with zircaloy in order to simulate immobilisation of TMI core debris. Bubbling air through the melts greatly enhanced the dissolution of these components. (4 refs.)

65417 Hot-pressed barium sulphate ceramic waste forms for direct immobilisation of medium level Magnox waste. A.Briggs, D.V.C.Jones, G.B.Cole (Materials Dev. Div., AERE Harwell, Harwell, Didcot, England).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.541-8

A possible method of treatment for Magnox cladding waste is by dissolution in nitric acid and precipitation of barium sulphate-based floc with which radioactive ions are co-precipitated. The floc could then be immobilised in a matrix material such as cement or bitumen to give the waste form, or alternatively can be converted directly into a waste form by hot pressing. The authors describe the direct conversion of barium sulphate floc, containing simulated radwaste, into a synthetic, ceramic version of the natural mineral barite by a hot-pressing route. In going from the Magnox waste to the hot-pressed barium sulphate to a volume reduction factor ~ 18 is achieved. The principal phases in the product are found to be $BaSO_4$, MgO and Fe_3O_4, and the degree of consolidation achieved depends on the MgO content. The leaching behaviour of the hot-pressed materials depends on the MgO content, and on the consequent level of open porosity. (2 refs.)

65418 Migration of radionuclide chains in subseabed disposal. A.K.Ray, H.E.Nuttall (Dept. of Chem. Engng., Univ. of Kentucky, Lexington, KY, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.549-56

The authors study subseabed disposal; the two-dimensional (axial and radial) migration of radionuclide chains released from a canister located in a sedimentary layer bounded at the top by the ocean and at the bottom by an impermeable basalt zone is analysed to determine the escape rate of radionuclides into the seawater. Analytical solutions have been derived to represent the transient concentration profiles within the sediment, flux and discharge rates to the water column of each member present in a decay chain. Using the properties of chain members present in actinide decay systems, the effects of half-life, adsorption equilibrium and other relevant parameters are elucidated. (9 refs.)

65419 Rheological characterisation of cementitious grouts used to dispose of intermediate-level radioactive waste by hydrofracturing at Oak Ridge National Laboratory. E.W.Mcdaniel, J.G.Moore (Chem. Technol. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.557-65

The hydrofracturing process is a waste disposal process in use at the Oak Ridge National Laboratory for the permanent disposal of locally generated waste solutions. This process is now being modified for use in the disposal of sludge that results from the sodium hydroxide neutralisation of acid waste solutions. In this process, the sludges will be slurried in a bentonite clay suspension and mixed with a solids blend of cement and other additives. The amount of dry solids required for each litre of waste slurry will be determined from a rheogram that relates the viscosity of the slurry with the grams per litre recommended for grouts with desirable flow properties. A description of the process and the development of rheograms are included. Data are presented on the use of chemical additives to control the flow properties of grouts. (8 refs.)

65420 Formulation and processing of polyphase ceramics for high level nuclear waste. A.B.Harker, P.E.D.Morgan, D.R.Clarke, J.F.Flintoff (Rockwell Internat. Sci. Centre, Thousand Oaks, CA, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.567-73

Two basic crystalline phase assemblages have been developed for incorporating the full range of Savannah River Plant waste compositions into polyphase ceramic forms. Both phase assemblages provide crystalline host phases, with stable mineral analogues, for all radionuclides in the waste. The first, an alumina based assemblage, immobilises the radioactive elements in solid solutions of magnetoplumbite and uraninite with the bulk non-radioactive waste elements being present in spinel and nepheline. The second assemblages uses the titanate based 'zirconolite' type fluorite structure and the alumina/iron based magnetoplumbite phases to host the radioactive nuclei with spinel and nepheline, again providing crystalline hosts for the non-radioactive elements. Both phase assemblages can be consolidated to a fine grain ceramic by hot isostatic pressing at 1040°C pressures from 20000 to 30000 psi. Redox control during processing, just sufficient to reduce uranium to the tetravalent state, is used. (10 refs.)

65421 On-line measurements of the volatilisation of ruthenium in a vitrification process. R.Odoj, M.Schwitz (Inst. for Chem. Technol., KFA Julich, Julich, Germany).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.575-83

The studies were performed using Ru-103 as a tracer. The volatilisation of Ru from ruthenium containing liquids, like HAW-solutions, is about 15%. A chemical denitration of these solutions with HCHO or HCOOH reduces the volatilisation to about 2%. Additional catalytic reduction with Fe-powder lowers the volatilisation to about 4%. The carry over of Ru seems to depend on the aerosol production rate and not the vapour pressure. Only RuO_2 could be detected in the off-gas. (4 refs.)

65422 Cementitious radioactive waste hosts formed under elevated temperatures and pressures (FUETAP concretes). L.R.Dole, J.G.Moore, G.C.Rogers, G.A.West, H.E.Devaney, M.T.Morgan, E.W.McDaniel, J.H.Kessler (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.585-93

Concretes formed under elevated temperatures and pressures (FUETAP concretes) are effective hosts for transuranic (TRU) and high-level defence and commercial wastes. Tailored cement formulations developed at Oak Ridge National Laboratory (ORNL) use Portland cement, fly ash, sand, and clay additives. These FUETAP concretes are cured under mild autoclave conditions, then the unbound water is removed. The authors summarise the FUETAP development program. These continuous studies address the major questions concerning the performance of radioactive waste forms. (15 refs.)

65423 Behaviour of radionuclides during the smelting of noncombustible solid wastes. M.Osaki, S.Yokoi (Daido Steel Co. Ltd., Nagoya, Japan), M.Miyagawa.

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.595-602

The melting process of noncombustible solid wastes seems to be one of the most promising processes for volume reduction and immobilisation. This melting process needs a high temperature of around 1500°C, but the behaviour of radionuclides in such a process and at such a temperature has not been fully examined. The authors melted small contaminated samples to examine the behaviour of radionuclides. Melted products were subjected to leaching tests. Many assorted samples were melted, and it was found that the vapour pressure of the radionuclide determined the distribution between melted products and dusts. The standard free energy of oxide formation and the quantity of stable nuclide of the radionuclide determined the distribution between metal and slag products. The leaching rate of melted products was sufficiently low. (no refs.)

65424 Vitrification of high-level radioactive waste in a small-scale joule-heated ceramic melter. G.B.Woolsey, M.J.Plodinec (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.603-8

Vitrification is the reference process for the immobilisation of radioactive waste from the production of defence materials at the Savannah River Plant (SRP). Since 1979, a small vitrification facility (1 lb/hr) has been operated at the Savannah River Laboratory using SRP waste. In previous studies, dried waste was fed to this smaller melter. The authors discuss direct feeding of actual liquid-waste slurries to the small melter. These liquid-feeding tests demonstrated that addition of premelted glass frit to the waste slurry reduces the amount of material volatilised. Results of these tests are in accord with results of large-scale tests with actual waste. (6 refs.)

65425 Metastable liquid immiscibility in nuclear-waste-glasses. J.E.Engell, G.Roed (Inst. of Mineral Industry, Tech. Univ. of Denmark, Lyngby, Denmark).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.609-16

For glass systems related to two potential nuclear-waste-glasses, ABS-39 and ABS-41, the 600°C isotherm of the metastable immiscibility field has been located experimentally. Both glasses are in the one phase glass field down to temperatures below 600°C. ABS-39 and ABS-41 are Na_2O-B_2O_3-SiO_2 glasses containing 1.66 wt% UO_2 and 9 wt% of simulated fission products. Additional components in ABS-39 are Al_2O_3 and Fe_2O_3. In ABS-41 these two oxides are partly substituted with ZnO and Li_2O. This substitution causes and extension of the metastable immiscibility field relative to the ABS-39 system. (10 refs.)

65426 Mercury reduction and removal during high-level radioactive waste processing and vitrification. R.E.Eibling, J.R.Fowler (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.617-22

A reference process for immobilising the high-level radioactive waste in borosilicate glass has been developed at the Savannah River Plant. This waste contains a substantial amount of mercury from separations processing. Because mercury will not remain in borosilicate glass at the processing temperature, mercury must be removed before vitrification or must be handled in the off-gas system. A process has been developed to remove mercury by reduction with formic acid prior to vitrification. Additional benefits of formic acid treatment include improved sludge handling and glass melter redox control. (1 ref.)

65427 Interim waste forms for high-level radioactive wastes: processing and properties. G.Bandyopadhyay (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.623-31

Several simulated interim waste forms have been investigated in the laboratory to study their suitability for application in handling and transportation of high-level radioactive wastes to terminal processing sites. The author discusses the fused-salt/sludge option and the silicate-based option. The results from tests on simulated fused-salt waste forms indicated that the process simplicity of this option is partially offset by the high water solubility and hygroscopicity of the product, which would necessitate special precautions during transportation and storage. The most promising silicate-based option is the ambient-temperature silicate/sludge process, in which the sludge is mixed with sodium silicate [and sometimes with $Ca(OH)_2$] and subsequently exposed to a controlled-humidity environment at room temperature to form a chemical bond. Solid material containing 75 wt.% synthetic calcined sludge, prepared by this process, has sufficient physical, chemical, and mechanical stability for use as an interim waste form. (7 refs.)

65428 Tailored ion exchange resins for combined cesium and strontium removal from soluble SRP high-level waste. M.A.Ebra, R.M.Wallace, D.D.Walker, R.A.Wille (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.633-40

Novel organic resins that achieve high selectivities for both medium and strontium have been synthesized. They are condensation polymers of resorcinol and formaldehyde with attached chelating groups. Their column performance compares favorably with that of commercially available resins for either cesium or strontium removal. By combining Cs^+ and Sr^{2+} removal in the same bed, these resins can significantly reduce the size and complexity of proposed facilities for processing defense high-level waste. (5 refs.)

Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.741-5
Nuclear fuel waste disposal research in Canada is concentrating on hard-rock disposal. The research programs concerned with the man-made components of

the disposal system are reviewed. Irradiated fuel and solidified reprocessing wastes are both being researched, as are durable containers, and buffer and backfill materials. This review concentrates mainly on the more scientific aspects of the research, which contribute to the selection of preferred options for the various components of the system, and which support directly or indirectly the safety analysis of the disposal concept. Some technology development is included in the program now, and this is expected to expand as confidence in the acceptability of the disposal concept grows. (45 refs.)

65442 Nuclear Regulatory Commission activities related to high-level waste materials issues. F.R.Cook (Div. of Waste Management, Nuclear Regulatory Comm., Washington, DC, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.[illegible]
Describes the materials related activities of the Nuclear Regulatory Commission's (NRC's) staff in the area of high-level waste licensing of a geologic repository for nuclear waste. It frames these activities in the context of existing draft regulations for high-level waste disposal. (no refs.)

65443 Effects of waste composition and loading on the chemical durability of a borosilicate glass. D.E.Clark, C.A.Maurer, A.R.Jurgensen, L.Urwongse (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.1-13
The effects of waste composition and percent loading in a borosilicate glass designed for US defense high level wastes (HLW) have been evaluated. Three types of simulated wastes were investigated: high alumina, high iron and a composite representative of an average waste composition from Savannah River Plant (SRP) waste tanks. Corrosion resistance of the borosilicate glass is significantly enhanced by the presence of any of the three types of wastes. Additionally, corrosion resistance is improved as the % waste loading is increased in the glass. The best corrosion performance was obtained with the high alumina waste in deionized water. (12 refs.)

65444 Chemical durability of glass containing SRP waste—leachability characteristics, protective layer formation, and repository system interactions. G.G.Wicks, B.M.Robnett, W.D.Rankin (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.15-24
Gives properties and characteristics of glass containing nuclear waste from the Savannah River Plant. (4 refs.)

65445 The mechanisms for hydrothermal leaching of nuclear waste glasses: properties and evaluation of surface layers. G.Malow (Hahn-Meitner-Inst., KFA Berlin GmbH, Berlin, Germany).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.25-36
Remobilization of solidified high-level waste by corrosion and transport of radionuclides by groundwater are the only likely events for radioactivity to find its way back to the environment. The interaction of the waste form with aqueous solutions is the most important mechanism and must be known for safety and risk analysis. It has been shown that the activity release depends on a number of experimental and environmental parameters. The corrosion mechanisms of the waste forms control the leach rate of individual components. Of particular importance is the resistance against water attack of various glass compositions and the formation of layers on the glass surface. The results for leaching in deionized water revealed that the mechanism was strongly influenced by the formation of a surface layer which determined the further attack on the glass. In the present work the specific weight losses of the glass after leaching in rock salt and $MgCl_2$–$MgSO_4$–NaCl–KCl solutions were measured and surface layers investigated. (5 refs.)

65446 Stability and alteration of naturally occurring low-silica glasses: implications for the long term stability of waste form glasses. C.C.Allen (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.37-44
Volcanic glass of basaltic composition (approximately 50 wt.% SiO_2) was studied as a natural analogue to proposed nuclear waste form glasses. Basaltic glass can resist devitrification and remain glassy for periods in excess of 10 m.y. Surface alteration of the glass occurs rapidly upon exposure to water or hydrothermal fluids, but is essentially absent if the glass remains dry. Alteration is restricted to a rind of clay-like, cryptocrystalline palagonite, generally less than 100 μm thick. Formation of this rind protects the underlying glass from further alteration. Similar rinds, or gel layers, have been produced in laboratory and field tests with borosilicate glasses. Major cations within the basaltic glass are selectively depleted or enriched relative to the glass in the alteration rind. Qualitatively-similar depletion and enrichment patterns characterize the short-term leaching behavior of candidate waste form glasses. (10 refs.)

65447 Long-term radioactivity release from solidified high-level waste. I. An approach to evaluating experimental data. F.K.Altenhein, W.Lutze (Hahn-Meitner-Inst., KFA Berlin GmbH, Berlin, Germany), R.C.Ewing.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.45-56
Safety and risk analyses for the isolation of radioactive waste in a repository must begin with a source term to quantify the amount of radioactivity released from the waste form under a specific set of conditions. The interaction of the waste form with aqueous solutions is the most important mechanism to consider, as any material released may be dissolved and reach the biosphere. In this regard the behaviour of heat generating high-level waste is of particular importance, because reaction rates are higher at elevated temperatures. A long-term leach rate was derived from previous and continuing experimental work. The authors do not describe the 'real case' release but provide guidelines for the design of leaching experiments and determine the required precision for the data. This can be derived from the relative sensitivity of extrapolated leach rates for various parameters measured in laboratory experiments. (14 refs.)

65448 A flow model for the kinetics of dissolution of nuclear waste forms: a comparison of borosilicate glass, Synroc and high-silica glass. P.B.Macedo, A.Barkatt, J.H.Simmons (Vitreous State Lab., Catholic Univ. of America, Washington, DC, USA).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.57-69
A model has been developed to predict the long-term leach or release rates of various waste-form materials under repository conditions. (20 refs.)

65449 Waste glass repository interactions. D.E.Clark, C.A.Maurer (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.71-82
The effects of repository material and a tailored backfill or overpack on the leaching behavior of glass have been studied. Two types of glasses were used in this investigation: (1) model glasses comprised of 33 mol.% alkali oxide-67 mol.% SiO_2, and (2) alkali borosilicate glasses with and without simulated wastes. Several types of repository material were placed in the same containers as the glasses to determine if their presence would alter the extent of leaching. A backfill material consisting of phosphate slime/sand mixtures was evaluated with the same procedure. The results indicate that the leaching behavior of the glass may be influenced by the presence of some materials. Preliminary results of a 16½ month burial experiment in Florida are also discussed. (14 refs.)

65450 Leaching of vitrified high-level radioactive waste. A.R.Hall, A.Hough, J.A.C.Marples (Chem. Div., AERE, Harwell, Didcot, England).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.83-92
This is part of a study of the leaching of individual elements from waste glasses. The first part reports on leaching of the major constituents at 30°C, and leaching of the alkalis at 20°C from glass UK189; the second part describes leaching of Sr, Cs, Tc and various actinides from glasses UK189 and UK209. (1 ref.)

65451 The role of metal ion solubility in leaching of nuclear waste glasses. B.Grambow (Pacific Northwest Lab., Richland, WA, USA).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.93-102
Since multicomponent waste glasses are unstable with respect to an assemblage of alteration products, thermodynamic equilibrium between the glass phase and the leaching solution can never be achieved. The author shows that the alteration phases resulting from the leaching of the waste glass ultimately regulate the solution concentrations as if equilibria with metal hydroxides or carbonates are established. (14 refs.)

65452 Relationship between glass leaching mechanism and geochemical transport of radionuclides. A.Avogadro, F.Lanza (Joint Res. Centre, Ispra Establ., Comm. of the European Communities, Ispra, Italy).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.103-12
An attempt has been made to subdivide the different elements present in the vitrified waste into classes in order to simplify the description of the release of the radio elements in the various repository conditions. (11 refs.)

65453 Leaching of actinides from simulated nuclear waste glass. S.Pickering, C.T.Walker (Joint Res. Centre, Karlsruhe Establ., Comm. of the European Communities, Karlsruhe, Germany), P.Offermann.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.113-24
The authors measured the resistance of simulated nuclear waste glasses to leaching by water and salt solution under the conditions of elevated temperature and pressure. Of particular interest was the behaviour of Am and Np. (10 refs.)

65454 Influence of a backfilling material on borosilicate glass leaching. F.Lanza, C.Ronsecco (Joint Res. Centre, Ispra Establ., Comm. of the European Communities, Ispra, Italy).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.125-33
The choice of backfilling material around a canister of waste-containing borosilicate glass is normally made on thermal conductivity grounds but it also affects the contact of water on the canister. If large amounts of water are in contact, the canister corrodes quicker and thus the glass is exposed to leaching quicker. (6 refs.)

65455 Effect of overpack materials on glass leaching in geological burial. L.Werme (SKBF Div. KBS, Stockholm, Sweden), L.L.Hench, A.Lodding.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.135-44
Discusses the findings in an in situ-burial experiment, presently being performed in the Stripa mine in Sweden. The purpose of the experiment is to evaluate the effects of various components in the SKBF/KBS waste storage system on the leaching of the vitreous waste form. Two configurations of glass, canister, overpack and buffer/backfill materials were designed. Both configurations were inserted into 56 mm diameter boreholes in the Stripa mine and maintained at 90°C. One of the configurations was also kept at ambient temperature, 9°C. In the experiments two glass types were used, ABS 39 and ABS 41. These glasses, developed by Dr. T. Lakatos of the Swedish Glass Research Institute, contain 9% simulated fission products by weight and are compatible with the French AVM process. (11 refs.)

65456 The interaction of borosilicate glass and granodiorite at 100°C, 50 MPa: implications for models of radionuclide release. D.Savage, J.E.Robbins (Harwell Lab., Inst. of Geological Sci., Harwell, England).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.145-52
An essential component of any assessment of HLRW geological disposal options is the quantitative prediction of radionuclide release rates from the near-field over time spans of the order of 10^3-10^6 years. Fundamental to this assessment is the investigation of the interaction of potential wasteforms with groundwater under repository conditions of temperature, pressure, and groundwater flow-rate. Therefore it was the intention of this study to examine the interaction of a typical wasteform (borosilicate glass) and a potential repository host rock (granodiorite) under near-field conditions of temperature, pressure and water flow-rate appropriate to the early (0-600 years), high temperature life of a repository, and to study the effects of saturation of waste components in the fluid phase on rates of radionuclide release. (10 refs.)

65457 Burial effects on nuclear waste glass. L.L.Hench (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA), L.Werme, A.Lodding.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.153-62
The purpose of this experiment was to evaluate the effects of various components of the SKBF/KBS nuclear waste storage system on the leaching of the vitreous waste form. Two configurations of nuclear waste glasses, canisters, overpacks, and backfill material were inserted into 5.6 cm×3 m deep boreholes located at the 350 m level in the STRIPA mine. Some were maintained at 90°C. The others were allowed to equilibrate at the ambient temperature of the mine, approximately 8°C. Two borosilicate nuclear waste glass compositions (termed ABS 39 and ABS 41) compatible with the French AVM process containing 9 percent by weight of simulated fission products were compared. The two compositions bracket the range of $SiO_2/Na_2O/B_2O_3$ ratios likely to be selected for commercial vitrification operations at La Hague. (9 refs.)

65458 The chemical durability of some HLW glasses: effects of hydrothermal conditions and ionising radiation. D.R.Cousens, R.A.Lewis, S.Myhra, R.L.Segall, R.St.C.Smart, P.S.Turner (School of Sci., Griffith Univ., Nathan, Queensland, Australia).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.163-71
The time dependence of leaching and dissolution under hydrothermal conditions at 250°C has been investigated in an autoclave designed for continuous sampling; it is found that the rates are in accord with those obtained by the commonly used procedures. The effect of pressure by itself has been studied in an ultracentrifuge; ambient rates for Si and Na loss remain unchanged up to about 40 MPa followed by a monotonic increase to about 1.5 times the ambient rates at 160 MPa. The surface layers formed as a result of chemical attack have been examined (XRD, IR, XPS and PIXE). It is found that Zn present in the glass or in the solution is retained in the siliceous layer which in some circumstances contains a crystalline zinc-hydroxy-silicate phase. A method for enhancing rates of displacement damage by a factor of $\sim 10^6$ has been developed. Powdered borosilicate glass and glass doped with UO_2 have been neutron-irradiated in a high-flux reactor. Irradiation doses equivalent to 10^6 years HLW storage have been achieved. The resultant stored energy of $\sim 10^2$ kJ kg^{-1} is released over the range 300 to 800K. The initial leaching/dissolution rates are found to be increased by a factor of about three by irradiation. (9 refs.)

65459 Determination of the corrosion mechanisms of high-level waste containing glass. H.Scholze, R.Conradt, H.Engelke, H.Roggendorf (Fraunhofer-Inst. fur Silicatforschung, Wurzburg, Germany).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.173-80
The German concept of high level waste final storage provides the use of certain glasses containing radioelement oxides as glass components. These waste forms are to be stored in rock salt formations in order to isolate the waste from the biosphere. The efficiency of this isolation is a most important question. The aim is to achieve a high safety standard that remains valid under extreme conditions such as the uncontrolled water entrance to the deposit. Investigations were carried out with two model glasses doped with inactive waste. Glass 1 relates to a waste glass developed from the glass ceramics C31 3EC, glass 2 is a borosilicate glass. (5 refs.)

65460 Results from a one-year leach test: long-term use of MCC-1. D.M.Strachan (Pacific Northwest Lab., Richland, WA, USA).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.181-91
Presents results from the long-term use of the MFF-1P Static Leach Test Method which has already been used for short-term testing and for comparing waste forms. Data were obtained on the leaching behavior of PNL 76-68 glass over a 1-year period. Complete solution analyses coupled with selected solid state analyses gave further insights into the mechanism of leaching for this glass and show that the MCC-1P test method can be used for periods up to at least 1 year. (12 refs.)

65461 Utilization of charged particle backscattering to study the near surface region of glasses. Application to depth profiling of lanthanium, cerium, thorium and uranium induced by aqueous leaching. P.Trocellier, B.Nens, C.Engelmann (Dept. de Chimie Appl. et d'Etudes Analytiques, CENS, Gif-sur-Yvette, France).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.193-202
The Rutherford backscattering technique is useful for the determination of the concentration profiles of some heavy elements in the near surface region of glasses, but is not able to provide chemical information on the elements detected. Nevertheless, it permits a non-destructive exploration of the surfaces of solids, and enables the actinides: Np, Pu, Am, ... to be detected. Relatively simple glasses containing either lanthanum and uranium or cerium and thorium were made, leached and finally examined to specify on one hand the analytical possibilities of the process, on the other hand the experimental conditions required to prevent secondary effects during sample bombardment. (2 refs.)

65462 On the leaching behaviour of a simple borosilicate glass in a confined environment. J.C.Petit, Y.Langevin, J.M.Lameille, J.C.Dran (Lab. Rene Bernas, Orsay, France).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.203-10
Cm-sized blocks of a simple borosilicate glass have been leached in hydrothermal conditions with various rates of water renewal. Weight loss measurements reveal that restricted water access does not slow down the dissolution rate of this particular glass as would be expected from solubility limits, but instead accelerates its destruction and its transformation into a secondary solid phase still ill-defined. (12 refs.)

65463 Comparative study of seven glasses for solidification of nuclear wastes. J.L.Nogues (Lab. des Verres, Univ. des Sci. et Tech. du Languedoc, Montpellier, France), L.L.Hench, J.Zarzycki.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.211-18
The relative leaching behavior of seven alkali borosilicate glasses considered for immobilization of high level radioactive wastes was compared using a static 90°C leach test similar to MCC-1. All compositions were compatible with the low melting temperature, 1150°C, viscosity and other process variables required for the French AVM process. The quantity of simulated waste products was from 10.9-15.9 weight %. (4 refs.)

65464 Chemical stability of simulated HLW forms in contact with clay media. P.Van Iseghem, W.Timmermans (Materials Sci. Dept., CEN, Mol, Belgium), R.de Batist.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.219-27
The corrosion stability of six simulated HLW forms proposed by several European countries (five borosilicate glasses and one borosilicate glass ceramic) in contact with different media relating to the clay disposal has been investigated for periods up to 80 days and at a surface area to solution volume ratio of 1 cm^{-1} under non de-aerated conditions. In the reference medium distilled water the corrosion stabilities are largely determined by saturation effects for elements such as Si, Ca, Mg, Sr, Fe and U. Si saturation is found to be enhanced by a large Al_2O_3 concentration in the glass. In the clay-water mixture these saturation effects are much less predominant. Wet clay attacks the waste forms faster than the clay-water mixture, although the corrosion rates tend to decrease with time in both clay media. In general, no simple Arrhenius-type temperature dependence for the corrosion behaviour is found for the interval between 40 and 200°C. (10 refs.)

65465 INTRACOIN—an international nuclide transport code intercomparison study. K.Andersson (Swedish Nuclear Power Inspectorate, Stockholm, Sweden), B.Grundfelt, J.Hadermann.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.839-47
To improve the understanding of various strategies for geospheric radionuclide transport modelling an international cooperation project with ten participating organisations has been set up. In the project—INTRACOIN (International Nuclide Transport Code Intercomparison) study—a comparison between models is made on three levels with increasing complexity. Calculations are performed with some 20 computer codes representing different modelling strategies. The INTRACOIN study is limited in its scope to far-field radionuclide geosphere transport models. Thus, near-field models, groundwater hydraulics and models for transport in the biosphere are not included. However, since the geological barrier is an important part of the safety system the study should contribute to the understanding of important phenomena related to long-term safety assessments. In addition it provides a forum for discussion and for direct exchange of experience between experts in the field. (2 refs.)

65466 In-situ solidification of low and medium level wastes. R.Kraemer, R.Kroebel (Projekt Wiederaufarbeitung und Abfallbehandlung, Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.849-58
Since 1976, a German R&D project has been carried out to find an alternative concept for the treatment and disposal of MLW and LLW arisings generated mainly in the planned German reprocessing plant and other nuclear facilities. The main feature of this concept is an in-situ solidification of preconditioned waste granules in large salt caverns located in the deep geological underground. The authors describe an experimental demonstration of relevant components on a semi-industrial, non-radioactive scale. (5 refs.)

65467 Computations of temperature profiles in the medium/low-level waste cement and in the rock salt surrounding the disposal cavern. W.Hauser, E.Smailos, R.Koster (Inst. fur Nukleare Entsorgungstech, Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.859-66
In the investigations discussed, a three-dimensional computer program was employed using experimentally determined data on the heat generation of the granule/grout product. This made it possible to calculate temperature profiles in the waste product as well as in the surrounding rock salt. (3 refs.)

65468 Granules, a new waste form for in-situ solidification of low-and medium-level waste. Z.Boguslawski, E.Dumont, W.Guber (F.J. Gattys Verfahrenstech. GmbH, Neu-Isenburg, Germany).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.867-71
The in-situ solidification process requires a preconditioning of MLW/LLW arisings by granulation. The main purpose thereof is the dissipation of the heat of hydration already above ground and to replace in the final concrete like waste form a considerable part (i.e. 60 vol. %) with inert granules. In conventional industry granulation is a well known process but the application in radioactive waste management in compliance with a number of specifications required considerable R&D efforts which are described here. Two dif-

ferent systems which are most appropriate for this process, i.e. the rotating dish as used by R. Koster and coworkers (1980) and the ploughshare mixer, have been investigated till the extent that a comparison between the two processes and their products could be performed. (3 refs.)

65469 Transport of waste into caverns by vertical flow of concrete suspensions. M.Weber, Y.Dedegil (Univ. Karlsruhe, Karlsruhe, Germany), H.H.Homann.
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.873-7
In the process for containerless final storage of radioactive waste, a granule-cement suspension (waste grout) is transported by means of a vertical pipe from above ground into the underground cavern. In order to determine the rheological characteristics of the suspension and the correct pipe diameter required for design of the industrial-scale system, an experimental program was carried out. (no refs.)

65470 Stability and construction of caverns for the disposal of cement low- and medium-level wastes. W.Raab, C.Frohn, M.W.Schmidt (Gesellschaft fur Strahlen- und Umweltforschung mbH Munchen, Inst. fur Tieflagerung, Braunschweig, Germany).
Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.879-88
The geomechanical and mining-technological aspects of the construction of salt caverns as disposal chambers have been investigated. With a view towards the stability analysis of such a cavern, FEM-estimates have been carried out and evaluated. From these it can be derived that a rotational ellipsoid would be the most suitable shape; its dimensions should be 82 m (vertical axis) and 42 m (horizontal axis); and the distance (safety pillar) between the neighbouring caverns should be 170 m (vertical) and 180 m (horizontal). For practical engineering purposes the rotational ellipsoid can be modified into a cylinder with conic bottom and top. The characteristics of partially and completely filled caverns were simulated. It was shown clearly that deformation of the salt rock comes to a halt when counteracted by the filling. Based upon the results of the stability analysis, investigations were made to find out a suitable mining technique for the construction of the cavern. (3 refs.)

65471 Fundamental study on separation of uranium from other metals by solvent extraction with tributylphosphate or tributylphosphine oxide in molten naphthalene. Y.Shigetomi, T.Kojima, H.Kamba (Dept. of Chem., Okayama Coll. of Sci., Okayama, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.140-4 (Feb. 1983).
The extraction behaviors of U and other metals has been studied as functions of the concentration of nitric acid or hydrochloric acid in aqueous media and as functions of the amount of naphthalene as diluents, when tributylphosphine oxide (TBPO) or tributylphosphate (TBP) was used as a extractant. The extraction phases could be easily separated as a solid by cooling to room temperature. Uranium could be separated from alkaline earth metals, transition metals and rare earth metals, and U was efficiently concentrated by extraction with molten naphthalene, compared with usual solvent extraction which used toluene, etc. (8 refs.)

65472 Powder metallurgy techniques in nuclear technology. P.G.Mardon (Chem. Div., AERE, Harwell, England).
Powder Metall. (GB), vol.26, no.1, p.1-9 (1983).
The nuclear application of conventional powder metallurgy routes is centred on the fabrication of ceramic fuels. The stringent demands in terms of product performance required by the nuclear industry militate against the use of conventional powder metallurgy to produce metallic components such as the fuel cladding. However, the techniques developed in power metallurgy find widespread application throughout nuclear technology. Illustrations of the use of these techniques are given in the fields of absorber materials, ceramic cladding materials, oxide fuels, cermet fuels, and the disposal of highly active waste. (47 refs.)

65473 Oxidation of uranium and plutonium mononitride and monocarbide briquettes. G.P.Novoselov, V.V.Kushnikov, V.A.Baronov, V.P.Serebryakov, N.M.Stepennova.
Sov. At. Energy (USA), vol.53, no.2, p.528-32 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.77-80 (Aug. 1982). [received: April 1983]
The prospects for using oxygen-free compounds of uranium and plutonium in composite fuels have stimulated research on schemes for reprocessing such rods. The scheme for reprocessing mixed nitride and carbide uranium-plutonium fuel should provide for isolating the main portion of the gaseous and volatile fission products. Here an oxidation process can be used, in which the structure of the initial fuel material is altered, with increase in volume and release of these fission products. The purpose of examining the oxidation of unirradiated mixed nitride–carbide uranium–plutonium fuel was to determine the effects of oxidation conditions on the completeness of the oxidative recrystallization in steady and dynamic states, and also on the phase transitions and the grain-size composition of the products. (8 refs.)

65474 Density and viscosity of fused mixtures of uranium chlorides and potassium chloride. S.F.Katyshev, Yu.F.Chervinskii, V.N.Desyatnik.
Sov. At. Energy (USA), vol.53, no.2, p.565-6 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.108-9 (Aug. 1982). [received: April 1983]
The possibility of using fused uranium chlorides as an electrolyte in obtaining and refining uranium metal as well as in reprocessing spent nuclear fuel necessitates a profound and comprehensive study of the physicochemial properties of multicomponent systems. The authors give the results of investigations of the density and viscosity of fused three-component KCl-UCl$_3$-UCl$_4$ mixtures and the viscosity of KCl-UCl$_4$ mixtures over wide ranges of temperature and concentration. (5 refs.)

65475 Expected performance of spent LWR fuel under dry storage conditions. V.Pasupathi, D.Stahl.
Report EPRI-NP-2735, Electr. Power Res. Inst., Palo Alto, CA, USA (Dec. 1982), 46 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
A review of available data for evaluating LWR spent-fuel performance under dry storage conditions is presented. A number of spent-fuel degradation mechanisms applicable to the dry storage environment are discussed, and conclusions are addressed.

Management of radioactive wastes in Europe (EC) history, philosophy and plans for the next five years .... See Entry 65440

28.43 FISSION REACTOR OPERATION

65476 On the low-frequency spatial dependence of the neutron response and noise field in LWRs. G.T.Analytis (Swiss Federal Inst. for Reactor Res., Wurenlingen, Switzerland).
Ann. Nucl. Energy (GB), vol.10, no.5, p.221-32 (1983).
By employing a 1-D homogeneous reactor model in conjunction with a simple-thermohydraulics BWR feedback model proposed by others, it is shown that contrary to the zero-power case which predicts point-kinetics behaviour at very low frequencies (below 0.1 Hz), when strong feedback effects are present, there will be significant space-dependent effects even at low frequencies and that the importance of these effects will be proportional to the reactor power and the coefficients of reactivity. By using realistic data corresponding to a commercial BWR, the importance of the higher harmonics in the low-frequency region is assessed, and the detector response as well as the coherence function are evaluated for different void reactivity coefficients. The numerical results are in agreement with experimental measurements in commercial BWRs and show that in the frequency region where feedback effects are dominant, the point model is not valid, the 'global' field of view of the detectors is drastically reduced and, for spatially-distributed and radially-uncorrelated noise sources, the coherence function between two detectors located at different radial positions decreases dramatically. (23 refs.)

65477 On the physical meaning of the fluid velocity measured in BWRs by noise analysis. D.Lubbesmeyer (Swiss Federal Inst. for Reactor Res., Wurenlingen, Switzerland).
Ann. Nucl. Energy (GB), vol.10, no.5, p.233-41 (1983).
The author deals with the question of the physical nature of the fluid velocity measured by analysing the noise signals of incore neutron chambers in an operating BWR. It is postulated by phenomenological arguments and proved by measurements that the measured velocity is usually the volumetric flux. The advantage of this finding is the fact that it now becomes very easy to determine the mass flux because in addition, only the steam quality x is needed and this can be commuted with the enthalpy balance using the axial neutron-flux distribution which can be easily measured. Because in a BWR the instrument tube with the neutron chambers is surrounded by four bundles which may not have equal power distributions and/or may have different mass-flows (and hence, different two-phase flow patterns), the influence of the four bundles on the result of the fluid-velocity measurements may differ with respect to the axial position where the measurement is performed. This means that it is plausible that while in one axial position the volumetic flux in one bundle is measured, in another axial position, the fluid velocity in another bundle is dominant. (14 refs.)

65478 The present state of development and the future of the high-temperature reactor in the United States of America. W.A.Simon, H.-W.Chi (General Atomic Co., San Diego, CA, USA).
VGB Kraftwerkstech. (German Ed.) (Germany), vol.62, no.12, p.1011-14 (Dec. 1982). In German.
The American prototype high-temperature reactor at Fort St. Vrain has been operating successfully for years. To date it has produced more than 3,000,000,000 kilowatt hours of electricity and a short while ago was cleared for operation at full load. Operating experience justifies expectations that the combined cycle HTR plant of 2240 MW thermal output favoured by the US Government and industry will offer significant economic advantages. (no refs.)

65479 Identification of BWR feedwater control system using autoregressive integrated model. S.Kanemoto, Y.Andoh (Nippon Atomic Industry Group Co. Ltd., Kawasaki, Japan), F.Yamamoto, M.Idesawa, K.Itoh.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.105-16 (Feb. 1983).
With a view to contributing towards a more reliable interpretation of noise behavior under normal operating conditions, which is essential for correct detection and/or diagnosis of incipient anomalies in nuclear power plants by noise analysis techniques, studies have been undertaken of the noise behavior in a BWR feedwater control system, using a multivariate autoregressive modeling technique. Noise propagation mechanisms as well as open- and closed-loop responses in the system are identified from noise data by a method incorporating an autoregressive integrated model. The closed-loop responses obtained with this method are compared with transient data from an actual test, and confirmed to be reliable in estimating semi-quantitative features. Other analyses performed with this model also yield results that appear reasonable in their physical characteristics. (17 refs.)

65480 Strength analysis of the vertical flow steam generators of nuclear power plants. M.Niezgodzinski, W.Zwolinski (Politech. Lodzka, Lodz, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.217-24 (1981). In Polish.
An analytical method is considered for calculation of the internal stresses and forces in the main elements of vertical flow steam generators. The heating tubes make an elastic foundation supporting the perforated bottoms. The bottoms are assumed to be ortotropic plates joined with a cylindrical shell and hemispherical or elliptical heads. Solutions are given for any conditions of exploitation. (8 refs.)

65481 Electromagnetic pumps for nuclear power. I.R.Kirillov.
Magnetohydrodynamics (USA), vol.18, no.3, p.284-92 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.87-97 (July-Sept. 1982). [received: April 1983]
In fast reactors the coolant usually consists of alkali metals, mainly sodium, which is circulated in the main loops primarily by mechanical and in auxiliary loops (filling, drainage, cleaning the metal, washing fuel assemblies, etc.) by electromagnetic pumps (EMP). EMP with power up to 100 kW have almost completely replaced mechanical pumps even in research and technological installations. The increasing demands for EMP, the commencement of design and construction of series stations with fast reactors, and the accumulated experience in making and using pumps permit proceeding with the creation of series EMP with power up to 100 kW and large EMP for the main loops in nuclear power plants. The author examines the technique used in the computational and design work in creating series induction EMP used in NIIEFA. A series of pumps intended for pumping sodium into auxiliary fast reactor systems and research stands are based on scales of pressures, flow rates (powers), and the working body temperatures. For asynchronous electrical machines such scales have come about as a result of extensive experience in developing and using series machines. (24 refs.)

65482 Flow recovery from a single subchannel blockage in a square-pitched rod array. J.D.Hooper (Lucas Heights Res. Lab., Australian Atomic Energy Comm. Res. Establ., Sutherland, NSW, Australia), D.H.Wood.
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.91-103 (Jan. 1983).
The flow recovery downstream of a sharp edged plate blockage of one subchannel for axial flow through a square-pitched, six-rod array has been investigated for a rod pitch to rod diameter ratio of 1.107. Wall shear stress, local axial velocities, secondary flow velocities, and all terms of the Reynolds stress tensor were measured. Mean and turbulent components of the air flow were measured by Pitot-static and hot-wire anemometer probes at several axial locations downstream of the blockage for a Reynolds number of 48×10^3. (14 refs.)

65483 Laser doppler measurements of flow in a rod bundle. S.Neti (Mech. Engng. & Mech., Lehigh Univ., Bethlehem, PA, USA), R.Eichhorn, O.J.Hahn.
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.105-16 (Jan. 1983).
A two component laser doppler velocimeter with polarized beams and frequency shift was used to measure the turbulent flow field for axial flow between the rods of a nine rod, square pitch rod bundle. Parameters measured include mean axial and lateral velocities, turbulence intensities and the friction factor. (16 refs.)

65484 Decontamination factors and release rates of UO_2 particles from boiling pools of sodium. A.Dayan, S.Zalmanovich (Dept. of Fluid Mech. & Heat Transfer, Tel-Aviv Univ., Tel-Aviv, Israel).
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.127-32 (Jan. 1983).
A semi-mechanistic model for calculating solid radionuclide release rates from boiling or bubbling pools of sodium is developed. The influence of particle spacial and size distributions on the decontamination of the releases is analysed. Decontamination factors are shown as a function of pool depth, bubbling characteristics and particle size distribution. The calculation of a decontamination factor for estimating the source term of large scale hypothetical core disruptive accidents is presented. (11 refs.)

65485 Two-phase flow instability in channels with sinusoidal heat supply. E.Lorenzini, C.Crescentini, M.Spiga (Istituto di Fisica Tecnica, Univ. di Bologna, Bologna, Italy).
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.133-7 (Jan. 1983).
The authors deal with the problem of Ledinegg instability for two-phase flow in systems reproducing the operative conditions of the channels between the fuel rods of a boiling nuclear reactor. Particular attention is devoted to the influence of the heat flux distribution. In addition, a numerical method is applied to predict the occurrence of two-phase flow instability. (3 refs.)

65486 Method for automatic monitoring of iodine radioactivity in the water coolant of an atomic power plant. L.N.Moskvin, V.W.Miroshnikov, V.A.Mel'nikov, I.S.Orlenkov, V.V.Chetverikov.
Sov. At. Energy (USA), vol.53, no.2, p.551-3 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.101-2 (Aug. 1982). [received: April 1983]
The use of a rapid chromatographic method for separating the reference radionuclides from water media on block selective sorbents greatly simplifies radiochemical monitoring of the coolant in an atomic power plant. The maximum use of the capabilities of instrumental analysis on which the method is based, as well as the simplification and great decrease in the number of chemical operations, permits creating comparatively easily automated radiochemical monitoring systems. The authors specifically studied the possibility of automating the monitoring of iodine radionuclides in the water coolant, which are reference nuclides for evaluating the hermetic seal of fuel-element jackets from radiochemical data. (2 refs.)

65487 Magnetic flux leakage for measurement of crevice gap clearance and tube support plate inspection. W.Lord.
Report EPRI-NP-2857, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 60 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
The design, construction, and operation of an 8-Hall element variable reluctance probe suitable for field use and capable of predicting the crevice gap clearance at eight discrete points around the circumference of the tube are detailed. Prechemical and postchemical flushing tests on a model boiler are described to illustrate the use of the probe, and suggestions are made for further probe refinement.

65488 Experiments on heat transfer crisis and hydraulic resistance in a 19-rod bundle. N.V.Tarasova, V.I.Kisina, T.A.Vanttola, O.M.Tiihonen.
Report 154, Tech. Res. Centre Finland, Electr. Eng. Lab., Espoo (Feb. 1983), 69 pp.
An experimental program was carried out, where heat transfer and hydraulic resistance were measured in a facility that simulated a fuel assembly of a Soviet VVER-440 nuclear power reactor. The experiments were performed in a test loop with four different rod bundles that consisted of 19 full height, directly electrically heated rods. Most of the tests were conducted close to nominal conditions of the simulated reactor. Heat transfer crisis of dryout type was measured at mass fluxes from 15 to 40% of the nominal flow of the reactor, when inlet temperature of flow and heat flux were varied in the neighbourhood of the nominal reactor values. The single- and two-phase heat transfer coefficients, single-phase friction, two-phase friction and the local minimum of friction were obtained. (21 refs.)

65489 Simulation of a digitally controlled system, using the SIMUL language: design of an anti-reset windup integral and state feedback controller. F.Gorez (Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.106-9 vol.3
The SIMUL simulation language is introduced and its application to thesimulationof continuous-time systems controlled by digital computers is described. Then, the control of the primary coolant temperature in a PWR nuclear power plant is considered. Large disturbances induce unacceptable transient oscillations due to the actuator speed limits; it is shown that these oscillations can be damped or eliminated, using a correction algorithm with a single parameter, the value of which can be determined via simulation. (10 refs.)

65490 Stability studies of a CANDU heat transport circuit. H.W.Hinds, P.D.McMorran, C.M.Tseng (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.53-6 vol.4
Thermal-hydraulic instabilities are possible in a figure-of-eight CANDU primary heat transport circuit when the coolant boils. A linearized model using transmission matrices in the frequency domain has been developed. Its predictions agree favourably with results from an experimental loop. The use of secondary feedwater control to stabilize the circuit was examined and found not to be practical. (7 refs.)

65491 MAXI-LILLIPUT: a simplified model of a French pressurized water reactor power plant. J.-L.Tyran (Electricite De France, Chatou, France).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.60-2 vol.4
Describes a simplified model of a French pressurized water reactor (PWR) power plant. The goal of this model is the simulation of the xenon effect and his consequence on the core axial power distribution with a reactor control by means of grey rods during load-following operations and remote control (e.g. from an automatic dispatch center). The author studies the effects of principal design parameters on the dynamics and controlled performances of a power plant: a study of load-following capability. LILLIPUT is a good simplified model with primary and secondary parts, but the core is punctual. MAXI-LILLIPUT is an extension of LILLIPUT with an axial core representation. (4 refs.)

65492 TRAC-BWR—a best estimate code for transient thermal hydraulic analysis of a BWR. J.G.Munthe Andersen, B.S.Shiralkar (General Electric Co., San Jose, CA, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.98-100 vol.4
TRAC-BWR (transient reactor analysis code for a Boiling water reactor) is a best estimate computer code for the analysis of transient thermal hydraulic phenomena in a boiling water reactor (BWR). The tasks involved in the development of the present version of TRAC-BWR, have involved significant changes to the structure of the code, development of new modules for the BWR components, such as jet pumps, steam separators, and fuel bundles, and the development of models for phenomena of particular importance in the BWR, such as accurate void fraction prediction and radiative heat transfer. The present version of TRAC-BWR is able to simulate all significant transient thermal hydraulic phenomena in a BWR. Moreover, due to the modular structure of the code, TRAC-BWR can be used to analyze heat transfer and two-phase flow for a range of applications, such as test loops, process heat transfer, etc. (3 refs.)

65493 Modeling of containment response to the dispersive mode of PWR vessel failure. J.C.Reck (Westinghouse Electric Corp., Pittsburgh, PA, USA), R.E.Henry, L.A.Wooten.
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.101-4 vol.4
When a Class 9 accident is postulated for some PWR designs, the failure of the reactor vessel while significant internal pressure exists could lead to dispersion of molten debris over the containment floor. This debris would be quenched by the water it contacts and result in a steam spike which, when coupled with a hydrogen burn could challenge the containment pressure limit. The MARCH code alone is inadequate for modeling this type of vessel failure phenomena. Through the use of a newly developed Dispersive Event Model, called DEMO, this scenario can be modeled when used with MARCH and a modified COCO code. Each of these computer codes is briefly discussed followed by a more detailed discussion of DEMO. (5 refs.)

65494 Verified simulation of a nuclear reactor transient in real time: stuck pressurizer relief valve. P.W.Wyatt, F.C.Luffey (Westinghouse Electric Corp., Pittsburgh, PA, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.105-7 vol.4
One of the classical plant transients which a simulator should be capable of handling is a stuck-open power-operator relief valve event. The paper gives a description of such a transient which is a comparison of the calculated and measured behavior for the situation using a SEL 32/77 minicomputer. (6 refs.)

65495 A three-dimensions kinetic code for PWR reactor. J.C.Barral (Electricite de France, Courbevoie, France), F.Blanchon, J.C.Lefebvre, J.Planchard, R.Seban.
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.108-10 vol.4
A 3-dimensional kinetic code coupled with a thermal hudraulic model is presented. The numerical methods used by this program are described and are illustrated by an example concerning a very fast transient (control rod ejection). (7 refs.)

65496 BWR loss of coolant technology review. G.E.Dix (Nuclear Fuel & Special Projects Div., General Electric Co., San Jose, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.3-19 vol.1
Over the past few years an integrated technology program has been pursued with the objective of defining the detailed response of the Boiling Water Reactor (BWR) for the entire spectrum of postulated loss of coolant inventory conditions The author summarizes the controlling phenomena for BWR transient events and identifies the similarities among results from the experimental facilities of various scales. (14 refs.)

65497 A review of current heat transfer correlations used in reactor safety assessment. D.C.Groeneveld, C.W.Snoek (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.20-8 vol.1
The authors summarize the result of a two-year review of published heat transfer predictive methods for reactor thermohydraulic analysis. All heat transfer modes, with the exception of condensation, were considered in this study. Where possible, the correlations considered were examined for their asymptotic and parametric trends. It is concluded that the most important heat transfer regimes (CHF, Transition Boiling, Film Boiling) have a limited data base. As a consequence, the correlations are not valid for the complete range of loss of coolant accident conditions and unjustified extrapolations of the correlations are common. To improve the prediction accuracy, it is suggested that a combination of empirical correlations with appropriate transition regimes and extrapolation factors to used. These extrapolation factors are designed to permit the correlations to be used over a wider range of conditions and geometries. (39 refs.)

65498 Detailed modelling of two phase flow and its application to system prediction. G.F.Hewitt (Engng. Sci. Div., Harwell Lab., Harwell, England).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.38-48 vol.1
Following a brief discussion of the deficiencies of the widely used empirical modelling methods, the development of more phenomenologically based models is discussed in the particular context of the prediction of gas-liquid flows. It is shown how the development of modern techniques for drop size and drop motion measurement may be used to throw more detailed light on the physical mechanisms. The next area explored is that of interfacial phenomena in two phase flow, with particular reference to wave behaviour and its link to shear stress in annular flow. Finally, a range of examples are given of the applications of phenomenological modelling, these applications being selected where possible to link closely with the general papers being presented in this sessions. The examples include flows in 'singularities' (venturis, nozzles) and flows in diabatic systems with departure from thermodynamic equilibrium. (19 refs.)

65499 Degraded core heat transfer. P.Ihle (Inst. fur Reaktorbauelemente, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.49-59 vol.1
The author discusses LOCA heat transfer conditions in slightly to severely disturbed PWR rod bundle geometries. Experimental results obtained out-of-pile are discussed showing that even coolant channel constrictions of up to 90% do not lead to core coolability problems for reduced reflood water injection rates corresponding to flooding velocities as low as 2 cm/s. However, thermal-hydraulic experiments cover the core temperature range below 1000 C only. Therefore, investigations are mentioned which can be used for obtaining information about the conditions at initiation as well as at termination of possible core degradation. (27 refs.)

65500 Condensation effects in reactor transients. W.Kirchner (Los Alamos Nat. Lab., Los Alamos, NM, USA), S.G.Bankoff.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.60-8 vol.1
Some recent results pertinent to condensation as it affects the course of LWR transients are reviewed. These include interfacial shear stress, local condensation heat transfer coefficients, and stability of stratified countercurrent steam-water flow. Cold-leg, and combined cold and hot leg, oscillations are also discussed. Some avenues for further research are pointed out. (35 refs.)

65501 Lessons in reactor thermal-hydraulics from operating plant transients. S.Levy (S. Levy Inc., Campbell, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.69-75 vol.1
The author presents lessons learned in reactor thermal hydraulics from operating plant transients, and the prediction of such effects. (14 refs.)

65502 A review of flow-induced vibrations in reactors and reactor components. M.P.Paidoussis (Dept. of Mech. Engng., McGill Univ., Montreal, Quebec, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.76-98 vol.1
The author presents a review of the state of the art of two classes of vibration problems encountered in reactors and reactor peripherals, namely vibration of cylindrical structures induced by cross flow and by axial flow. A historical perspective is given first, in which the milestone contributions that have advanced the state of the art are highlighted. Then recent developments in the last decade, with emphasis on those in the last three years, are discussed, concluding with an assessment of the state of understanding of the fluidelastic mechanisms involved, on the one hand, and of predictive tools available to the designer, on the other. (240 refs.)

65503 Applied mathematical methods in nuclear thermal-hydraulics. V.H.Ransom (EG&G Idaho Inc., Idaho Falls, ID, USA), J.A.Trapp.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.99-110 vol.1
Applied mathematical methods are used extensively in modeling of nuclear reactor thermal-hydraulic behavior. This application has required significant extension to the state-of-the-art. The problems encountered in modeling of two-phase fluid transients and the development of associated numerical solution methods are reviewed and quantified using results from a numerical study of an analogous linear system of differential equations. In particular, some possible approaches for formulating a well-posed numerical problem for an ill-posed differential model are investigated and discussed. The need for closer attention to numerical fidelity is indicated. (19 refs.)

65504 Radionuclide scrubbing in water pools: bubble hydrodynamics. L.J.Flanigan, D.D.Paul, R.P.Collier, R.A.Cudnik (Battelle's Columbus Labs., Columbus, OH, USA), R.N.Oehlberg.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.137-44 vol.1
In assessing the severity of degraded core accidents in light water reactors, limited credit is taken currently for scrubbing of fission products, either vapors or aerosols, in water pools. The development and use of more realistic scrubbing decontamination factors (DFs) could have a significant effect on the perceived safety of nuclear power plants. The authors present the results of the first phase of the experimental program, a study of hydrodynamics of steam/noncondensible gas mixtures injected into a water pool through a single orifice. (25 refs.)

65505 Two-phase redistribution in horizontal subchannel flow—turbulent mixing and gravity separation. M.Shoukri, H.Tawfik, A.M.C.Chan (Res. Div., Ontario Hydro, Toronto, Ontario, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.145-52 vol.1
The redistribution of two-phase flow in two horizontal interconnected subchannels caused by gravity separation and turbulent mixing has been investigated experimentally using an air-water loop. The measured redistribution data included the axial distribution of void fraction and liquid and gas flow rates in the two subchannels. The redistribution data exhibited an asymptotic behaviour, approaching certain flow distributions independent of the inlet distribution. The observed equilibrium distributions were explained as a balance between gravity forces and turbulent diffusion. A constitutive equation for transverse vapour drift, to account for both gravity separation and turbulent diffusion, is presented and a turbulent mixing coefficient identified. (13 refs.)

65506 A comparison of flow regime behaviour in adibatic and diabatic two-phase flow trefoil simulations. M.K.Nicholson (Dept. of Chem. & Petroleum Engng., Univ. of Calgary, Calgary, Alberta, Canada), J.R.Nickerson.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.153-60 vol.1
Flow regime studies were made with a 20.0 mm hydraulic diameter horizontal trefoil under simulated adiabatic and diabatic boiling flow conditions. A low pressure transparent test section using a two component air-oil fluid system was equipped with porous tubes to generate three simulated axial heat flux profiles. The same test section was then used to simulate adiabatic flows over a matching set of mass velocities using an upstream mixer. Flow regimes were studied visually and revealed that the adiabatic regimes compared well with those encountered earlier with a 25.8 mm hydraulic diameter annulus and tube with the same fluid system. (9 refs.)

65507 Two-phase instability in nozzle flows of bubbly liquid. G.Matsui, S.Morioka (Inst. of Engng. Mech., Univ. of Tsukuba, Ibaraki, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.161-9 vol.1
The interrelation between local behaviour of bubbles and main flow in a bubbly liquid two-phase flow is investigated theoretically and experimentally. A model taken account of slip and volume-oscillation of bubbles predicts that two kinds of instability mechanism may exist in a bubbly liquid flow. These instabilities exhibit individual features in main flow condition for occurrence, spectrum of growing wave and connection with local behaviour of bubbles. In order to examine such instability mechanisms and their effects on behaviour of bubbles and main flow, an experiment on nozzle flow of bubbly liquid is performed by using a nitrogen-water two-phase loop. (8 refs.)

65508 Flow through a small break at the bottom of a large pipe with stratified flow. J.Reimann, M.Khan (Inst. fur Reaktorbauelemente, Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.170-7 vol.1
A small break of a horizontal coolant pipe is investigated. This flow geometry and accident scenario are of interest in nuclear reactor safety research. Results are presented on the mass flow rate and quality distribution as a function of a dimensionless interface level. (21 refs.)

65509 Flooding experiments in tubular geometry with steam-water up to 70 bar. L.Augello, R.Martini (CIS, Milano, Italy).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.178-83 vol.1
An experimental study has been performed to obtain counter-current flow limitation data over a range of conditions as near as possible to that of a PWR pressurizer surge-line. Measurements of the water flowrate and of the pressure drop versus the steam flowrate are presented, and analyzed in terms of the Wallis parameters. (4 refs.)

65510 Parameters for the scaling of oscillatory two-phase flows. A.E.Levin, B.H.Montgomery (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.184-92 vol.1
Sodium boiling is an important phenomenon in the analysis of hypothetical accidents in liquid metal fast breeder reactors. Tests have been performed in

two sodium loops to study sodium boiling behavior. Testing is currently under way in the simulant boiling flow visualization loop (an atmospheric pressure, single-tube water experiment, to study oscillatory flows by direct visual means). Several dimensionless parameters have been derived to aid in properly scaling the experiments and analyzing the data. (6 refs.)

65511 De-entrainment of liquid on vertical rods in air-water cross flow. R.K.Sundaram (Nuclear Engng. Dept., Yankee Atomic Elec. Co., Framingham, MA, USA), J.C.Chen, J.C.Dallman.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.193-201 vol.1
Liquid holdup on a vertical rod has been measured in air-water cross flow at various air and water flow rates. The measurement technique involved the use of band-type capacitance probes which are capable of measuring the liquid film thickness around the rod circumference. A simple model, based on laminar flow theory, is shown to reasonably explain the trends in film thickness variation. (10 refs.)

65512 Drop motion and deposition in annular two-phase flow. N.S.Wilkes, B.J.Azzopardi, I.Willetts (Engng. Sci. Div., AERE Harwell, Didcot, England).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.202-9 vol.1
The simulation model for drop motion in annular two phase flow developed by James et al. (1980) has been extended, tested against experimental data and used to gain insights into aspects of annular two phase flow. The effect of drop size and gas velocity on drop velocity has been examined. The model has also been used to study the evolution of drop size spectra. Simulations have been made of deposition experiments where drops were injected singly at the tube centre line. (16 refs.)

65513 Analysis and experiments of droplet trajectories in sprays. R.K.E.Cossmann, G.B.Wallis, H.J.Richter, C.P.Thron (Thayer School of Engng., Darmouth Coll., Hanover, NH, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.210-17 vol.1
The influence of steam condensation on the shape of subcooled water sprays was investigated. In the theoretical model the water is assumed to act as vapor sinks and thus create a velocity field in the steam. The resulting force on the spray water is used to compute the final spray shape. Measurements with single full scale BWR spray nozzles were performed. The droplet size and the water distribution were measured as a function of steam pressure and vertical distance from the nozzle exit. (7 refs.)

65514 Some details of developing slugs in horizontal two-phase flow. E.Kordyban (Univ. of Detroit, Detroit, MI, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.218-25 vol.1
A photographic study has been carried out to uncover the details of development of slugs in horizontal two-phase flow. Based on the observations it is proposed that the slugs originate as a consequence of local Kelvin-Helmholtz instability at the wave crest, rather than the instability of the whole wave. (15 refs.)

65515 The application of a charnock-based estimate of interfacial stress to some near-horizontal, stratified two-phase flows. Y.L.Sinai (R&D Technol., Nat. Nuclear Corp. Ltd., Warrington, England).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.226-34 vol.1
Heurstically-derived mixing length distributions are invoked in a calculation which leads to closed-form solutions for the fully-developed turbulent velocity field of a single-phase fluid moving in a plane channel, with arbitrary conditions imposed at the walls. The results are then applied to the liquid flow in planar, stratified two-phase flow, and when the interfacial stress is significant the mean liquid flow is determined analytically. This analysis bears upon the stratified phenomena which arise in PWR accidents, in particular the small LOCA. (25 refs.)

65516 Wave dispersion effects in two-phase flow. L.Y.Cheng, D.A.Drew, R.T.Lahey,Jr. (Rensselaer Polytech. Inst., Troy, NY, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.235-45 vol.1
A wave dispersion relation for a two-component, two-phase flow was derived from a two-fluid, two-pressure model. The one-dimensional space/time averaged conservation equations of mass, momentum and energy for each phase were used to describe the dynamics of the two-phase mixture. The Rayleigh equation was used to describe the dynamics of a pulsating bubble and relate the phasic pressures. Heat conduction between the pulsating bubbles and the surrounding liquid was also modeled. The dispersion relation was derived from the linearized conservation equations and the Rayleigh equation. (27 refs.)

65517 Shock phenomena in a one-component two-phase bubbly flow. K.Akagawa, T.Fujii, Y.Ito, S.Hiraki, T.Kitano, S.Tsubokura (Dept. of Mech. Engng., Kobe Univ., Kobe, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.246-51 vol.1
Characteristics of shock phenomena induced by a quick valve closure at the downstream end of a channel are investigated. An experiment was conducted for a two-phase bubbly flow in a horizontal stainless tube with a surge tank having a gas chamber at the upstream end. Freon 113 was used as the working fluid. The pressure transients were measured at four locations along the tube. The profiles of the transient pressure, the potential surge, the equilibrium pressure rise, and the propagation velocity of the compression wave are presented and are discussed, comparing them with those in an air-water two-component two-phase flow. (10 refs.)

65518 Flow regime and heat transfer measurements during reflooding with steady and oscillatory coolant injection. M.Kawaji, Y.S.Ng (Dept. of Nuclear Engng., Univ. of California, Berkeley, CA, USA), S.Banerjee.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.262-70 vol.1
Simultaneous void fraction and wall temperature measurements were made during bottom-reflooding of a vertical Inconel tube with inlet flows consisting of various constant and oscillatory injection rates. To support interpretation of these data, flow regime visualization experiments were also done on reflooding of a heated quartz tube under similar inlet flow conditions. (16 refs.)

65519 Dryout and post-dryout heat transfer in helically coiled tubes. M.Kaji, S.Nakanishi, S.Ishigai, M.Kume, K.Mori (Dept. of Mech. Engng., Osaka Univ., Osaka, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.271-8 vol.1
Dryout at high steam qualities and post-dryout heat transfer to steam-water two-phase flows in helically coiled tubes are experimentally investigated. Dryout mechanism in the coiled tube is investigated by air-water flow experiments. Flow developments in the coiled tube are visualized and flow rates of liquid droplets entrained are measured. (20 refs.)

65520 Effect of system pressure on film boiling heat transfer, minimum heat flux and minimum temperature. A.Sakurai, M.Shiotsu, K.Hata (Inst. of Atomic Energy, Kyoto Univ., Kyoto, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.279-85 vol.1
Film boiling heat transfer on a horizontal test heater in a pool of saturated and subcooled water was investigated at pressures ranging from 20 kPa to 2 MPa. A semi-empirical equation and a modified Bromley's equation are given, both of which could express the saturated film boiling heat transfer coefficients. The heat transfer coefficients under saturated and subcooled conditions are expressed by the two-phase boundary layer film boiling model with the boundary condition of equal liquid and vapor interfacial velocities. Empirical equations of interfacial wave length, departing bubble diameter and departing bubble frequency at near the minimum film boiling temperature are given. (13 refs.)

65521 A study of subcooled film boiling heat transfer under reactivity initiated accident conditions in light water reactors. N.Ohnishi, K.Ishijima, S.Tanzawa (Div. of Nuclear Safety Res., JAERI, Ibaraki, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.286-94 vol.1
The empirical correlations for subcooled film boiling heat transfer during a reactivity-initiated accident in light water reactors are derived from inverse heat conduction calculations using the cladding surface temperatures measured in in-reactor experiments. The experimental data for cold-startup conditions and hot-standby conditions are used for this investigation. The present correlations are compared with existing correlations from ex-reactor experiments. The results of transient fuel behavior calculations with a computer code which included the present correlations are in good agreement with the corresponding measured data from the experiments. (8 refs.)

65522 The quenching of thick-walled nickel test sections. G.Costigan (Engng. Sci. Div., AERE Harwell, Harwell, England).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.295-302 vol.1
A series of quenching tests have been performed on a composite test section assembled from four thick walled nickel cylinders. The tests were carried out at a pressure of 2 bar at mass fluxes of 50, 100, 150 kg/m^2S and inlet subcoolings of 15°C and 30°C, in both upflow and downflow. The experimental data demonstrate complex post dryout heat transfer behaviour due to the interaction of the various components of the composite test section. Parametric trends show that post-dryout heat fluxes increase with both mass flux and inlet subcooling, in upflow and downflow. In downflow heat fluxes are much lower than those obtained for corresponding inlet conditions in upflow. A simple extension of the Bromley analysis for laminar film boiling can be shown to account for the effects of flow velocity and direction if buoyancy effects are allowed for in downflow. The transition boiling region data indicate that Hsu's correlation will overpredict the measured heat fluxes by a large amount. (18 refs.)

65523 Comparison of flashing heat transfer correlations. T.Siikonen (Nuclear Engng. Lab., Helsinki, Finland).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.303-9 vol.1
Several flashing correlations used in non-equilibrium computer codes have been compared. The comparison has been performed by calculating test cases, where non-equilibrium effects dominate. The test cases include a fast and a slow pressure transient and a critical flow test. (12 refs.)

65524 An appraisal of interfacial vapour generation laws used in thermal-hydraulic analysis. Ph.Vernier, Ph.Berne (Service des Transferts Thermiques, CENG, Grenoble, France).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.310-15 vol.1
The determination of interfacial transfer laws is of primary importance for the development of advanced thermalhydraulic codes. Among these laws, the vapour generation law plays an important role. The authors discuss some vapour generation laws. They are divided into empirical laws and analytical laws. (24 refs.)

65525 Evaluation of nonequilibrium effects in bundle dispersed flow film boiling. D.G.Morris, C.B.Mullins, G.L.Yoder (Engng. Technol. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.316-25 vol.1
The effects of thermodynamic nonequilibrium in dispersed flow film boiling heat transfer are examined. Steady-state and transient rod bundle data are used to evaluate several empirical heat transfer models commonly employed to predict post-CHF behavior. Nonequilibrium effects can also be treated by explicitly modeling the phenomena. The thermal-hydraulic code COBRA-TF employs this approach. Using bundle data the models in the code are evaluated. (31 refs.)

65526 Inferring nonequilibrium vapor conditions in convective film boiling. S.W.Webb (Gilbert Associates Inc., Reading, PA, USA), J.C.Chen.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.326-34 vol.1
Single-phase convective heat transfer correlations are often used to infer nonequilibrium vapor conditions in dispersed flow convective film boiling. The inferred vapor conditions for each correlation were compared to thermodynamic limits for the data. The predicted vapor temperatures were also compared with the new available experimental measurements. (27 refs.)

65527 Post dry-out heat transfer in uncovered core accidents. A.Annunziato, M.Cumo, G.Palazzi (ENEA/TERM-C.R.E. Casaccia, Rome, Italy).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.335-42 vol.1

TMI accident has risen the interest of safety nuclear engineers in a relatively new heat transfer condition in reactor core, i.e. a situation in which the coolant flowrate is so low that the liquid level may be below the active length of the core and a particular type of post dry-out heat transfer dominates the temperature regime in the uncovered region. Therefore, an experimental research has been performed employing a very simple loop with a particularly accurate test section instrumentation for the measure of coolant and wall temperatures. Critical qualities at the dry-out point and post dry-out heat transfer coefficients have been systematically measured and compared with the available correlations. Moreover post dry-out heat transfer has been investigated with particular focus on the entrained droplets population and a droplet size distribution law has been derived by means of the coolant temperature measurements. (21 refs.)

65528 A thermodynamic similarity correlation for modeling of flow boiling dryout. E.G.Hauptmann, V.Lee (Dept. of Mech. Engng., Univ. of British Columbia, Vancouver, BC, Canada).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.352-5 vol.1

A general correlation for CHF during flow boiling dryout was developed using the assumption that true fluid-to-fluid modeling requires simultaneous thermodynamic, hydrodynamic and geometrical similarities. A series of CHF experiments were conducted using CO_2 in a vertical upflow arrangement. More than 1100 data points were taken over a range of reduced pressures coinciding with that of benchmark tests in water and Freon 12. (10 refs.)

65529 Evaluation of performance of eight CHF correlations with the VIPRE-1 computer code. J.M.Cuta (Battelle, Pacific Northwest Labs., Richland, WA, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.356-69 vol.1

The author evaluates the performance of eight CHF correlations within the VIPRE-1 thermal-hydraulic subchannel analysis code. VIPRE-1, is a core thermal-hydraulic code tailored for utility applications. The eight CHF correlations available in the VIPRE-1 code include the three major PWR vendors' correlations: CE-1, B&W 2, W-3S and W-3C. The Columbia-EPRI and Bowring WSC-2 correlations were also compared with a small sample of transient CHF data from BWR-LOCA experiments. (19 refs.)

65530 Application of multi-fluid model in dryout prediction. T.Saito, T.Ishizuka, J.Kimura, T.Kagawa (Toshiba Corp., Tokyo, Japan).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.370-8 vol.1

Dryout predictions using a multi-fluid model for the annular two-phase regime are compared against dryout data obtained for BWR conditions. (20 refs.)

65531 A critical heat flux correlation for triangular array rod bundles with tight lattices. M.D.Donne, W.Hame (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.379-89 vol.1

Many CHF-correlations have been developed for water cooled rod clusters representing typical PWR or BWR fuel element geometries with relative wide rod lattices. However the fuel elements of an Advanced Pressurized Water Reactor (APWR) have a tight fuel rod lattice, in view of increasing the fuel utilization. Application of the new CHF-correlation to conditions typical for an APWR shows that the predicted critical heat fluxes are much smaller than those calculated with the usual PWR-CHF-correlations, but they are higher than those predicted by the B&W-VPI&SU correlation. (20 refs.)

65532 Evaluation of predictability of multiple CHF events. D.G.Reddy, C.F.Fighetti (Heat Transfer Res. Facility, Columbia Univ., New York, NY, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.390-7 vol.1

The phenomenon of multiple CHF events in rod bundle heat transfer tests is examined. The adequacy CE-1, B&W 2, and Columbia subchannel CHF correlations in predicting higher order CHF events is ascertained based on local coolant conditions obtained with the COBRA IIIC subchannel code. The data from three sets of tests simulating both PWR and BWR reactor cores are studied using a combination of statistical analyses and parametric studies. (10 refs.)

65533 Investigation of transient critical heat flux phenomena and forced convection film boiling heat transfer. I.Vojtek (Gesellschaft fur Reaktorsicherheit, Garching, Germany).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.398-407 vol.1

The authors investigated the transient critical heat flux phenomena and the forced convective film boiling heat transfer coefficients. Post experimental analysis has been performed using the computer code BRUDI-VA, a modified version of blowdown code BRUCH-D. The authors calculated local thermal hydraulic parameters and evaluated different correlations used in the analysis of reactor safety problems for the calculation of maximum and minimum critical heat flux and forced convection film boiling heat transfer coefficients. (23 refs.)

65534 Annular burnout data from rod bundle experiments. G.L.Yoder, D.G.Morris, C.B.Mullins (Engng. Technol. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.408-18 vol.1

Burnout data for annular flow in a rod bundle is presented for both transient and steady-state conditions. Tests were performed with a pressurized-water loop containing an electrically heated 64-rod bundle. The bundle configuration is typical of later generation pressurized-water reactors with 17×17 fuel arrays. Both axial and radial power profiles are flat. All experiments were carried out in upflow with subcooled inlet conditions, insuring accurate flow measurement. (14 refs.)

65535 A simplified finite element model for fully developed axial turbulent flow in rod bundles. M.Abdelghany, M.C.Roco, R.Eichhorn (Dept. of Mech. Engng., Univ. of Kentucky, Lexington, KY, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.421-32 vol.1

A simplified computational scheme that can be efficiently applied to predict fully developed axial flow in rod bundles subchannels is presented, and compared with experimental results for different flow conditions. Galerkin's finite element method and the physical model of turbulence proposed by Roco and Zarea (1976) are used in this approach. The flow in the corner, wall and central subchannels for both triangular and square rod bundles is investigated. Different values of the subchannel pitch to diameter ratio and various Reynolds numbers are considered. In all these cases, the present computational scheme gives the correct qualitative trends for the distributions of the axial velocity and wall shear stress. (23 refs.)

65536 Formulation of a two-fluid model for mixing in LWR bundles. M.S.Kazimi (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA), J.E.Kelly.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.433-9 vol.1

The space and time averaged two-fluid flow equations are shown to lead to distributive and turbulence terms, which can be lumped into one term to explain two-phase lateral mixing in rod bundles. A model is developed for this mixing and applied into the THERMIT two-fluid code. The model predictions were tested against small rod bundle tests for pressure and quality conditions representative of BWR and PWR conditions. (13 refs.)

65537 Application of a discontinuity-tracking-technique to thermal-hydraulics analysis. U.Graf, J.Miro, A.Schaefer, W.Werner (Gesellschaft fur Reaktorsicherheit mbH, Garching, Germany).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.440-8 vol.1

Transient analysis of nuclear power plants requires a detailed description of the coolant thermal-hydraulics during rather long periods of time. In order to calculate those transients, very efficient methods have to be used for space- and time-integration of the differential equations describing the two-phase-flow of the coolant fluid and the heat transfer in the primary and secondary loops of the plant. To show the applicability of physical models for describing the thermal-hydraulics of transient two-phase flow, a new developed two-phase flow model has been taken. This is a four-equations model and is believed to be the simplest model that can describe accurately kinematic non-equilibrium between phases. The authors give an analysis of both, the fixed grid and the local 'Langrange' ASWR method, when applied to this four-equations model. (12 refs.)

65538 A numerical algorithm for calculating steady-state flow splits. L.V.Ellis (Energy Inc., Idaho Falls, ID, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.449-60 vol.1

The author presents an extension of a proven algorithm for determining the steady state when flow splits are known a priori to the case in which corresponding junction form loss coefficients supplant knowledge of flow rate splits in the set of initially known steady-state data. (3 refs.)

65539 A multigrid scheme for the thermal-hydraulics of a blocked channel. M.Lacroix, R.Camarero, A.Tapucu (Ecole Polytech. de Montreal, Montreal, Quebec, Canada).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.461-9 vol.1

An efficient scheme has been developed for the numerical solution of the Navier-Stokes and energy equations applied to the flow of an incompressible fluid in a partially blocked two-dimensional subchannel. A vorticity-stream function formulation with a generalised curvilinear coordinate system is used for a wide range of geometric configurations. The system of coupled, non-linear equations is solved by a block relaxation scheme for which the rate of convergence is substantially increased by a multigrid technique. A number of numerical experiments are described to illustrate the efficiency of the proposed approach. It is then applied to a typical subchannel problem in thermal-hydraulics. (9 refs.)

65540 Numerically induced pressure excursions in two-phase-flow calculations. J.H.Mahaffy, D.R.Liles (Safety Code Dev. Group, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.470-3 vol.1

Pressure spikes that cannot be traced to any physical origin sometimes are observed when standard Eulerian finite-difference methods are used to calculate two-phase-flow transients. This problem occurs with varying frequency in nuclear reactor safety codes such as RELAP, RETRAN, COBRA, and TRAC. These spikes usually result from numerical water packing or from interactions between spatial discretization and heat transfer. (4 refs.)

65541 Application of a Taylor series approximation to represent the heat transfer constitutive relationships in thermal-hydraulic computer codes. S.E.Dingman (Sandia Labs., Reactor Safety Studies Div., Albuquerque, NM, USA), R.A.Nelson.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.474-9 vol.1

A technique for decreasing the computer execution time for convective heat transfer calculations in thermal-hydraulic computer codes is investigated. The technique consists of approximating the convective heat flux by the first-order terms of a Taylor series expansion, with fluid and heat structure conditions as independent variables. The technique was incorporated into the RELAP5 computer code. Calculations were performed to determine the savings in computer-execution time and to verify the accuracy of the approximation. (9 refs.)

65542 Comparison of FEBA test data with RELAP4/MOD6 postcalculations. K.Rust, P.Ihle (Inst. fur Reaktorbauelemente, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), S.L.Lee.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.731-7 vol.1

The FEBA forced feed reflood experiments included base line tests with unblocked bundle geometry. The experiments consisted of separate effect tests on a full-length 5×5 rod bundle. Selected experimental cladding temperatures and heat transfer coefficients are compared with the analytical data postcalculated by the RELAP4/MOD6 transient analysis code. The comparison gave a 'satisfactory' matching of the peak cladding temperatures, quench times, and heat transfer coefficients at nearly all axial elevations for the flooding velocity and system pressure in the ranges of those FLECHT and semiscale experiments which were used in the code assessment. However, it should be noted that this matching was made possible only by the use of artificially adjusted values of the empirical code input parameters for the water entrainment model and the liquid weighting factor for the dispersed flow regime after the experimental results had already been known. (8 refs.)

65543 Analytical prediction of blowdown system experiments using DRUFAN. A.B.Wahba, K.Wolfert (Gesellschaft fuer Reaktorsicherheit mbH, Garching, Germany), F.Tanabe.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.752-60 vol.2
The significant physical phenomena observed during HDR and Battelle blowdown experiments are correctly predicted by the thermal-hydraulic system code DRUFAN-02. (10 refs.)

65544 An evaluation of water hammer in nuclear power plants. A.W.Serkiz (Div. of Safety Technol., US Nuclear Regulatory Commission, Washington, DC, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.803-6 vol.2
Water hammer can occur as a result of steam-void collapse, steam-driven slugs of water, pump startup into voided lines, and inadvertent closures of valves; the result is large hydraulic pressure loads. Since 1968, about 150 water hammer events have been reported in USA nuclear power plants; damage has been confined to pipe hangers and snubbers. The increase in reported water hammer events in the 1970s led to the designation of water hammer as Unresolved Safety Issue A-1 in 1979. Since the mid-1970s reported occurrences and their underlying phenomena have been studied, and corrective design and operational measures have been implemented. This paper presents the results of generic evaluations of water hammer occurrence and reported damage and sets forth technical findings. These findings indicate that good design practices and operational procedures can minimize the occurrence of water hammer. (6 refs.)

65545 A method for assessing reactor core cooling without forced circulation. Y.Feyginberg, P.Sergejewich, W.I.Midvidy (Nuclear Studies & Safety Dept., Ontario Hydro, Toronto, Ontario, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.808-17 vol.2
Under some of the postulated accidents of the CANDU PHWR, electrical power to the heat transport (HT) pumps may be interrupted resulting in the loss of forced circulation. Experiments and analyses indicate the existence of two modes of natural circulation which can provide adequate core cooling at decay power levels. These are thermosyphoning (single-phase or two-phase) and intermittent buoyancy induced flow (IBIF). (5 refs.)

65546 Natural circulation in boiling water reactors. J.M.Healzer (S. Levy Inc., Campbell, CA, USA), P.G.Bailey.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.818-24 vol.2
This report describes a study to examine the natural circulation behavior of the boiling water reactor (BWR). In the first part of the study, data have been compared to predictions of natural circulation operating conditions for several BWRs. The second part of the study examines natural circulation operation at low power and reduced inventory conditions such as might occur in the unlikely event of a system isolation followed by failure to make-up water lost due to decay heat boil-off. For this analysis, the same model used earlier to predict power operation at natural circulation is used to demonstrate the low inventory behavior of the BWR. The conclusion of this second part of the study is that the BWR system can sustain substantial inventory loss before it can no longer maintain natural circulation cooling. (5 refs.)

65547 Natural circulation cooling characteristics during PWR accident simulations. J.P.Adams, G.E.McCreery, V.T.Berta (EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.825-32 vol.2
A description of natural circulation cooling characteristics is presented. Data were obtained from several pressurized water reactor accident simulations in the loss-of-fluid test (LOFT) pressurized water reactor (PWR). The reliability of natural circulation cooling, its cooling effectiveness, and the effect of changing system conditions are described. Quantitative comparison of flow rates and time constants with theory for both single- and two-phase fluid conditions were made. It is concluded that natural circulation cooling can be relied on in plant recovery procedures in the absence of forced convection whenever the steam generator heat sink is available. (17 refs.)

65548 Natural-circulation experiments in two SRI/EPRI test facilities. R.L.Kiang, P.R.Jeuck,III (SRI Internat., Menlo Park, CA, USA), J.-P.Sursock.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.833-9 vol.2
Two laboratory-scale facilities, both modeled after pressurized water reactors (PWRs), were tested. The geometry of the low-pressure facility (0 psig) followed the Westinghouse four-loop design; that of the high-pressure facility (100 psig) followed Combustion Engineering's two-loop design. One of the primary objectives of these tests was to study decay heat removal by means of natural circulation. Accordingly, a large amount of natural-circulation data was collected. Thermal-hydraulic responses of the systems under conditions ranging from noncondensable gas injection to forced-to-natural-circulation transitions were also tested. This paper presents data from two specific natural-circulation tests: one with the primary system subcooled, the other under a two-phase condition. Test results demonstrated that natural circulation in the primary loops of these facilities, either single-phase or two phase, is capable of long-term heat removal. The single-phase flow is steady, hence its flow rate is calculable by an energy balance equation. When the primary loop is under a two-phase condition, temperatures at various locations around the loop exhibit unsteady characteristics, which indirectly reflect the unsteadiness of the loop flow. (9 refs.)

65549 Natural circulation cooling in a PWR geometry under accident-induced conditions. D.J.Shimeck, G.W.Johnsen (EG&G Idaho Inc., Water Reactor Res. Test Facility, Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.849-57 vol.2
The characteristics and limits of natural circulation heat rejection over a wide range of conditions were experimentally investigated in a small-scale model of a pressurized water reactor. Conditions that were varied included primary and secondary coolant inventory, decay heat power, and primary noncondensible gas content. The results have defined three distinct modes of natural circulation, their limits and transition points, and the characteristic 'signatures' accompanying natural circulation behavior. Particular emphasis is focused on the limits of natural circulation under severely degraded primary and secondary conditions. (12 refs.)

65550 On natural circulation in high temperature gas-cooled reactors and pebble bed reactors for different flow regimes and various coolant gases. G.Melese d'Hospital (General Atomic Co., San Diego, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.858-66 vol.2
The use of CO_2 or N_2 (heavy gas) instead of helium during natural circulation leads to improved performance in both high temperature gas-cooled reactors (HTGR) and in pebble bed reactors (PBR). For instance, the coolant temperature rise corresponding to a coolant pressure level and a rate of afterheat removal could be only 18% with CO_2 as compared to He, for laminar flow in HTGR; this value would be 40% in PBR. There is less difference between HTGR and PBR for turbulent flows; CO_2 is found to be always better than N_2. These types of results derived from relationships between coolant properties, coolant flow, temperature rise, pressure, afterheat levels and core geometry, are obtained for HTGR and PBR for various flow regimes, both within the core and in the primary loop. (3 refs.)

65551 Reflux condensation in a vertical channel flow. B.K.-H.Sun, M.Toren, Seung Oh (Nuclear Power Div., Electric Power Res. Inst., Palo Alto, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.867-73 vol.2
A simple one-dimensional, two-phase, channel flow model is presented together with numerical results and a comparison with experimental data. The model is based on an integral, modified Nusselt type of energy and momentum balance, taking into consideration interfacial shear and vapor depletion due to condensation. Complete condensation length and flow limitations due to countercurrent flooding are presented for different vapor flow rates and system pressure. These results may be applied to estimate the conditions of occurrence of the reflux condensation mode in steam generator tubes and the associated heat removal capability of pressurized water reactors. (14 refs.)

65552 Degraded cooling in a CANDU. R.A.Brown, C.Blahnik, A.P.Muzumdar (Nuclear Studies & Safety Dept., Ontario Hydro, Toronto, Ontario, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.884-90 vol.2
Loss-of-coolant accident (LOCA) analysis for a CANDU reactor considers a wide range of postulated break sizes and locations in the heat transport piping. Coincident failure of the emergency coolant injection system to operate on demand must also be considered. This paper describes the unique features of the CANDU core and heat transport system, and how these features affect the response of the system to a LOCA. The possible range of behaviour of the fuel and fuel channels following a LOCA is discussed in terms of the maximum fuel temperature which could occur, and also in terms of the potential for breaching the core pressure boundary (in the case of CANDU, this boundary comprises a large number of horizontal pressure tubes each containing horizontal fuel bundles). It is concluded that fuel temperatures remain well below the UO_2 melting temperatures, and that the integrity of the pressure boundary is maintained, for all postulated LOCAs. (2 refs.)

65553 Dryout of an inductively heated bed of steel particles with subcooled flow from below. F.P.Tsai, J.Jakobsson, I.Catton, V.K.Dhir (School of Engng. & Applied Sci., Univ. of California, Los Angeles, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.891-5 vol.2
An experimental investigation of dryout heat flux in an inductively heated bed of metal particles with forced flow from below has been conducted. The mass flux varied from 0 to 3.11 kg/m^2 sec. Freon-113 was used as coolant. Particle sizes were 1588 μm, 3175 μm, and 4763 μm in diameter. The dryout heat flux was found to increase as mass flux increases. When the mass flux is large enough the dryout heat flux asymptotically approaches the total evaporation energy of the inlet flow. (10 refs.)

65554 Mixed convection of liquid metal in a rectangular cavity. R.Vidil, R.Martin, D.Grand (Service des Transferts Thermiques, Centre d'Etudes Nucleaires de Grenoble, Grenoble, France).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1248-53 vol.2
The basic problem studied is the interaction between a vortex and a thermal stratification. This phenomenon takes place in a rectangular cavity. On its lower side, the cavity communicates with a channel in which forced flow is imposed. Heat is applied to the cavity through the roof. This problem is studied with three different approaches: a computer code and two experiments (one is sodium, the other in water). In the sodium experiment, the governing parameters are prototypic of reactor conditions such as SUPERPHENIX. So this sodium experiment is a benchmark for the validation of other approaches: water test models and computer programs. (3 refs.)

65555 An analytical model for heat transfer in a pin-bundle presentation and first validation. J.-M.Le Gouez (Centre d'Etudes Nucleaires de Cadarache, Saint Paul Lez Durance, France).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1302-9 vol.2
The ANACONDA mathematical model presented is aimed at calculating the three dimensional temperature field inside a LMFBR rod-bundle cooled by forced convection. In this thermal model the cross section of the rod bundle is discretized into a number of fluid and solid regions (pin heating zones, claddings, hexagonal duct). The lateral operators representing transverse energy transport inside the rod bundle (i.e. at a given cross-section) are approximated so as to enable an integration by hand of the thermal balance set of equations without any discrete representation of the axial space or time operators. The

first validation of the model was done through calculating the three dimensional enthalpy field inside a 19 pin bundle, which had been experimentally investigated by the CEA in Grenoble (GR 19I bundle). The model was then used for the preparation of the SCARLET II local porous blockage experiments to the run by EDF at Chatou. (5 refs.)

65556 Semi-empirical model for friction factors in LMFBR wire-wrapped rod bundles. P.Carajilescov (Div. de Engenharia Mecanica Aeronautica, Sao Jose dos Campos, Brazil), E.F.Fernandez.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1318-25 vol.2
A semi-empirical model is developed for subchannel and bundle average friction factors for laminar and turbulent axial flows in wire-wrapped rod arrays. The results of this model are compared to available experimental data and they are considered satisfactory for wide ranges of geometrical parameters. (11 refs.)

65557 Distributed parameter analysis of the thermal-hydraulic behavior of wire wrapped rods in LMFBR cores. M.C.Chuang, M.D.Carelli, M.R.Yeung (Westinghouse Res. Labs., Pittsburgh, PA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1326-37 vol.2
Analytical methods to evaluate in detail the principal thermal-hydraulic parameters of wire-wrapped rods in LMFBR core assemblies are discussed. The features are presented of two computer codes which calculate the coolant temperature and velocity, cladding and fuel temperatures at any radial and circumferential position around the entire rod circumference. They are the FATHOM-360 code which analyzes an inboard rod, and FATHOM-360S for an edge rod. Typical design applications are presented, such as calculation of the 'hot spot factor' effects due to the wire wrap spacing and to eccentric positioning of the fuel pellet within the cladding. Correlations of direct usefulness to the core designer are reported which express the above factors in terms of the rod operating parameters. Results of an extensive verification effort are presented. The codes predictions compare very favorably against experimental data obtained for different geometries and under different environmental conditions. (14 refs.)

65558 Analytical study of laminar buoyant convective flow between vertical parallel plates for various thermal boundary conditions. T.F.Irvine,Jr. (State Univ. of New York, Stony Brook, NY, USA), C.L.Quarini.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1382-90 vol.2
The velocity and temperature profiles for laminar buoyancy and forced convective flows between vertical flat parallel plates are predicted. Specific examples relating to tall narrow channels with forced convection and to closed high aspect ratio cavities, as may be found in proposed active and passive insulation systems for LMFBRs are presented. (8 refs.)

65559 Criterion for the onset of mixed convection in vertical bare and wire wrapped rod bundles. P.D.Symolon (Dept. of Chem. Engng., MIT, Cambridge, MA, USA), N.E.Todreas, W.M.Rohsenow.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1391-402 vol.2
In the LMFBR blanket assembly, large radial power gradients exist which cause buoyancy-induced flow redistribution within the rod bundle. A criterion is developed to predict the onset of mixed convection in vertical bare and wire wrapped rod bundles. The onset of the mixed convection criterion determines when a forced convection analysis is no longer valid, so that a procedure with mixed convection capability must be employed. The criterion is intended for use with existing numerical tools to aid the user in selecting the solution method most appropriate for a given set of operating conditions. (5 refs.)

65560 Finite-element predictions of laminar natural convection in a trapezoidal water-filled plenum and comparison with experiment. P.M.Birchenough (Theoretical Phys. Div., AERE Harwell, Harwell, England), K.H.Winters.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1403-11 vol.2
A finite-element simulation of laminar natural convection of water in a trapezoidal plenum with a sloping cold floor, adiabatic short sidewall, heated long widewall and either heated or adiabatic roof is reported. Results are presented at Rayleigh numbers of 5×10^9 and 2×10^{10}. These are compared with measurements made in a water-filled, 1/22-scale model of the plenum at a higher Rayleigh number of around 10^{12}, and good qualitative agreement is found. Much of the flow is confined to the lower triangular region of the cavity and the upper part is largely stagnant with a high degree of temperature stratification. The effect of an imposed roof flux is to increase the flow stagnation and temperature stratification in this upper part. The Nusselt number varies strongly along the sloping floor and attains a high value at the base of the short vertical wall. (2 refs.)

65561 Instrumentation for measurements in spray experiments. H.J.Richter, S.B.Miller, G.G.C.Durkee (Thayer School of Engng., Dartmouth Coll., Hanover, NH, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1420-6 vol.2
Recent years saw substantial research activity on the subject of Emergency Core Cooling Systems of Light Water Reactors. One area of this research is the study of the behavior of emergency cooling spray nozzles in Boiling Water Reactors. At the start of this program it was not known which information was needed to support the theory. Therefore, attempts were made to measure as many variables as possible in the experiments. Development of new instrumentation was one of the major tasks during this work. New devices were developed to measure water flux as a function of distance from the nozzle, to measure droplet velocity, size and frequency. The development of these devices presents a step towards readily useable measurement devices. Further development is certainly necessary before this goal is achieved. (11 refs.)

65562 An optical probe for interface detection at high pressure (180 bar) and high temperature (360°C) [two-phase flow]. J.M.Delhaye, R.Charlot (Service des Transferts Thermiques, CENG, Grenoble, France), F.Danel, J.Arnault.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1427-30 vol.2
Optical probes have been widely used for about ten years to detect the passage of interfaces at a given point of a gas-liquid two-phase flow. The materials and the design of the probes that have been used so far have prevented their use at temperatures higher than 110°C and/or in severe industrial environments (corrosive fluids, liquids loaded with solid particles, etc.). In order to overcome these drawbacks, sapphire probes have been developed and tested. The authors describe the technology of these new probes and the life tests that they have withstood. (16 refs.)

65563 Three-dimensional density field determination by external stationary detectors and gamma sources using selective scattering. N.Kondic (US NRC, Washington, DC, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1443-55 vol.2
In many fields one needs to know the spatial density distribution; two-phase systems are of particular importance. In particular, gas-liquid mixtures play a role in power generation, chemistry, bio-medicine etc. An intrusion into the measured system is frequently undesired or not permitted. Therefore, external, non-invasive instrumentation has definite advantages. Photon-energy discrimination methods, measuring scattered fluxes, can employ stationary equipment; they need partial collimination or only protective shielding. The results are achieved with a higher information/irradiation ratio than is the case with transmission methods. The utilization of a mesh of isogonic lines (each of them being characterised by its particular scattering angle) has several advantages when compared with the mesh of straight lines ('pencil beams') used in tomography. The ultimate experimental arrangement employing Compton scattering has fan/fan beam geometry, i.e. wide angle emitting and receiving of gammas. The direct result of the measurement is a 'scattergram', i.e., countrate versus scattered energy spectrum. Besides representing the 'signature' of a two- or three-dimensional density distribution, it also enables the reconstruction of local density values. The authors outline the necessary analysis and presents experimental proof of principle. (12 refs.)

65564 Modeling aspects of the PNA technique for flow rate measurements. J.L.Achard (Inst. de Mecanique de Grenoble, Grenoble, France), J.M.Delhaye.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1456-62 vol.2
The Pulsed Neutron Activation (PNA) technique uses a pulsed, external neutron source to induce some activity into a flowing fluid. It can be used to measure mass flow rates of steady single-phase and two-phase flows. A basic case of high interest corresponds to turbulent single-phase flows when the radial velocity profile is approximately flat. Two authors give for this elementary case different data reduction formulas. Kehler (1980) claims that a $1/\tau^2$ weighting technique is appropriate whereas Perez-Griffo et al. (1982) promote a $1/\tau$ technique. The present authors give and justify their own point of view on this controversy. In addition, they indicate how to properly take into account the irradiation of the fluid slab and the detection of the induced activity. (12 refs.)

65565 Experimental and numerical model for annular dispersed downward air/water flow in a venturi. S.El-Haggar, C.T.Crowe (Mech. Engng. Dept., Washington State Univ., Pullman, WA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1463-8 vol.2
The flow of annular-dispersed gas-liquid mixtures through a restriction results in flow characteristics much different than a fully developed annular-dispersed flow in a duct. Experimental studies at Washington State University have shown that pressure drop in a venturi geometry is strongly dependent on the droplet concentration in the core flow and upon droplet size. The experiments were carried out in a downward flow with nominally fifty percent of the liquid flow associated with droplets in the core. Pressure drop measurements were made with different liquid flow rates and venturi geometries. It was found that the standard approach to predict pressure drop using the Lockhart-Martinelli (1949) or Chisholm (1967) correlation is far from adequate for these types of flows. The inadequacy of these empirical correlations has led to the development of a more descriptive numerical model. The model is based on the equations for a quasi one-dimensional flow with suspended water droplets in the gas core and a water layer in the wall. (10 refs.)

65566 LOFT instrumentation: an overview of challenges and developments. D.B.Engelman (Idaho Nat. Engng. Lab., EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1477-82 vol.2
The Loss-of-Fluid Test (LOFT) reactor is an integral test facility, devoted to an investigation of the thermal-hydraulic and fuel behavior of a reactor system during off-normal conditions. The requirement to measure important parameters at many points within the reactor has led to a number of advances in the state-of-the-art of experimental instrumentation as applied to an operating reactor. Since LOFT is an operating nuclear reactor, the instruments must survive full Pressurized Water Reactor (PWR) operating conditions, and be able to measure various off-normal conditions. The instruments developed and applied on LOFT include specialized velocity, density, liquid level, and mass flow instruments, as well as a variety of specialized fuel behavior instrumentation. These instruments have been excellent, both in survivability and production of data. (11 refs.)

65567 Effects of thermocouple installation and location on fuel rod temperature measurements. R.D.McCormick (Idaho Nat. Engng. Lab., EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1483-90 vol.2
Describes the results of analyses of nuclear fuel rod cladding temperature data obtained during in-reactor experiments under steady state and transient (simulated loss-of-coolant accident) operating conditions. The objective of the analyses was to determine the effect of thermocouple attachment method and location on measured thermal response. The use of external thermocouples increased the time to critical heat flux (CHF), reduced the blowdown peak temperature, and enhanced rod quench. A comparison of laser welded and resistance welded external thermocouple responses showed that the laser welding technique reduced the indicated cladding steady state temperatures and provided shorter time-to-CHF. A comparison of internal welded and embedded thermocouples indicates that the welded technique gave generally unsatisfactory cladding temperature measurements. The embedded thermocouple gave good, consistent results, but was possibly more fragile than the welded thermocouples. Detailed descriptions of the thermocouple designs, attachment methods and locations, and test conditions are provided. (2 refs.)

65568 Temperature independent measurement of nuclear fuel rod pressures. T.R.Billeter (EG&G Idaho Inc., Richland, WA, USA), J.C.Lucero.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1506-10 vol.2
The fuel rod plenum gas pressure sensor for Loss-of-Fluid-Test (LOFT) reactor exhibits measurement error when immersed in a dynamic temperature environment. Methods of reducing the error during transients have centered on providing thermal shields around the 500 kHz eddy current type transducer and on modifying the signal conditioning. A cylindrical copper enclosure around the transducer envelope reduced transducer signal response to imposed temperature variations. Signal modification methods employing two excitation frequencies and detection by phase-sensitive techniques proved very effective. Significant reductions of measurement error result from use of the signal compensation technique. Using phase sensitive signal detection, the absolute pressure measurement error is reduced by a factor of at least three as compared with the error in measured pressure as related to the uncompensated signal output. Consequently, the technique is recommended for analysis of signals from LOFT eddy current based pressure transducers. (4 refs.)

65569 Relationship of core exit temperature noise to thermal-hydraulic conditions in PWRs. F.J.Sweeney (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), B.R.Upadhyaya.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1511-18 vol.2
Core exit thermocouple temperature noise and neutron detector noise measurements were performed at the Loss of Fluid Test Facility (LOFT) reactor and a Westinghouse, 1148 MW(e) PWR to relate temperature noise to core thermal-hydraulic conditions. The noise analysis results show that the RMS of the temperature noise increases linearly with increasing core ΔT at LOFT and the commercial PWR. Out-of-core test loop temperature noise has shown similar behavior. The phase angle between core exit temperature noise and in-core or ex-core neutron noise is directly related to the core coolant flow velocity. However, if the thermocouple response time is slow, compared to the coolant transit time between the sensors, velocities inferred from the phase angle are lower than measured coolant flow velocities. The results indicate that core exit temperature noise is a potentially valuable tool for the detection of thermal-hydraulic anomalies such as flow blockages or boiling. (11 refs.)

65570 Nuclear reactor measurements at up to 550°C. A.Goodings (Control & Instrumentation Div., AEE Winfrith, Dorchester, England).
Colloquium on 'High Temperature Electronics', London, England, 23 March 1983 (London, England: IEE 1983), p.6/1-4
The region of interest comprises the moderator, fuel and its associated coolant channels. Details vary with the reactor type and temperatures may vary from a few tens of degrees centigrade (near biological shielding) to of order 1000°C (within the fuel). Coolant outlet temperatures in power producing reactors lie between about 300°C in water systems and 550°C in the Advanced Gas-cooled Reactor and in sodium-cooled reactors. The local atmosphere is coolant at high pressure and sensors must also be able to survive a radiation environemnt of fast and thermal neutrons plus a concomitant gamma flux. In some cases the latter can deposit energy at a rate of order 1 $W.g.^{-1}$ and may lead to substantial temperature rises above local ambient. It is for this reason that 550°C technology is sometimes required in systems with an apparent temperature limit of order 300°C. Neutron flux measurements are usually required for control purposes and it is often necessary to follow a working range of about 9 decades from shutdown to full power. This is necessary for operational reasons but can be difficult with a single type of sensor, particularly since reactor designs often impose limits on possible sensor locations. (8 refs.)

28.44 FISSION REACTOR PROTECTION SYSTEMS, SAFETY AND ACCIDENTS

65571 A case study on effectiveness of structural reliability analysis in nuclear reactor safety assessment. A.Yamaguchi, S.Kondo, Y.Togo (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan).
Reliab. Eng. (GB), vol.5, no.1, p.21-36 (1983).
An effective method for quantitative evaluation of structural reliability based on 'stress strength model' is developed with the objectives of taking a larger number of factors into the evaluation than before and giving useful results within moderate computing time. The method is applied to the reliability analysis of PWR pressure vessels. The results show the relative importance of inspection as well as the parameter uncertainty for assuring the reliability analysis of PWR pressure vessels. The results show the relative importance of inspection as well as the parameter uncertainty for assuring the reliability of the structure, although analysis is limited with the scope of linear elastic fracture mechanics. This case study also shows that the analysis of structural reliability is effective for safety assessment of nuclear power plants in general and possibly for the improvements of the consistency in the design code. (10 refs.)

65572 Simulation experiment of five percent small break loss-of-coolant accident of boiling water reactor. K.Tasaka, Y.Koizumi, Y.Anoda, H.Kumamaru, M.Shiba (JAERI, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.89-104 (Feb. 1983).
Five-percent small break tests have been conducted at the ROSA-III test facility with various emergency core cooling system (ECCS) actuation conditions. A break was assumed at the main recirculation pump inlet line. No dryout of the fuel surface was observed in tests with a high pressure core spray system (HPCS) actuation irrespective of the conditions of the other ECCS. Without HPCS the whole core was uncovered to the steam environment; however, the peak cladding temperature (PCT) was limited to 1022K, which is well below the present safety criteria of 1473K. The results of the test with the highest PCT without HPCS actuation were analyzed by the RELAP4/Mod6 computer code. The calculated fuel surface temperatures agreed well with measured results in the blowdown phase. (20 refs.)

65573 Propagation of expansion wave in flexible-wall tube. T.Watanabe, H.Mikami (Res. Lab. for Nuclear Reactors, Tokyo Inst. of Technol., Tokyo, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.117-26 (Feb. 1983).
As a model of the fluid-structure interaction which occurs during a loss-of-coolant accident in a pressurized water reactor, the pressure variation in the expansion wave propagating through the flexible-wall tube was measured along with the deformation of the wall. An analysis of the experimentally observed phenomena is performed by solving one-dimensional flow equations coupled with an equation of the wall deformation. The method employed is a numerically stable semi-implicit donor-cell difference method. The rate of pressure decrease was found to be reduced in comparison with the case of the rigid-wall tube. The fluid-structure interaction generates the pressure profile which is regarded as a superposition of the pressure profile of the expansion wave in the rigid-wall tube and the disturbance generated by the deflection of the flexible wall. The vibrations of the pressure and the flexible wall due to the inertia of the wall were also found. Both the damping of the deflection and the wall friction of the structure are found to be important parameters pertinent to the fluid-structure interaction phenomena. (11 refs.)

65574 Integrated solidity test measurement of the airtight compartment system at the nuclear power station in Paks. M.Osztheimer, M.Taubner, Zs.Techy.
Meres & Autom. (Hungary), vol.31, no.1, p.23-8 (1983). In Hungarian.
Gives a brief report on the purpose of the integrated solidity test measurements of the airtight compartment system of the nuclear power station and on the applied measuring principle. The measuring system and the selected measuring methods are evaluated. The characteristic features of the airtight system of the Paks nuclear power station's first block and their effects on the measurement are mentioned. (2 refs.)

65575 Steam generator probe positioning device. M.D.Groves.
Report EPRI-NP-2774, Electr. Power Res. Inst., Palo Alto, CA, USA (Dec. 1982), 42 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
Maintenance of PWR nuclear plant boilers continues to be a major problem in the nuclear power industry. Results are presented of a Phase I feasibility study of a device that would prevent man-rem radiation dosages by eliminating the need for manned entry into the channel head to emplace positioning devices for tubing inspection probes. Developed as part of a series of projects to improve inspection methods for steam generators, the proposed device is discussed in terms of its advantages, offering reduced radiation exposure, shorter inspection time, greater versatility and speed, and less skill and training for the equipment operators.

65576 Full-scale turbine missile casing tests. H.R.Yoshimura, J.T.Schamaun.
Report EPRI-NP-2741, Electr. Power Res. Inst., Palo Alto, CA, USA (Jan. 1983), 196 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
Presents the results of two full-scale tests simulating the impact of turbine disk fragments on simple ring and shell structures that represent the internal stator blade ring and the outer housing of an 1800-rpm steam turbine casing. Structural and finite element analysis and data interpretation, estimates of energy during impact, missile displacement and velocity histories, and selected strain gage data are included.

65577 Test results of a jet impingement from a 4 inch pipe under BWR LOCA conditions. T.Isozaki, T.Yano, N.Miyazaki, R.Kato, R.Kurihara, S.Ueda, S.Miyazono.
Report JAERI-M-82-110, Japan Atomic Energy Res. Inst., Tokai, Ibaraki, Japan (Sept. 1982), 54 pp.
Hypothetical instantaneous pipe rupture is now considered to be one of the design basis accidents during the operation of the light water reactor. If a pipe rupture accident occurs, the pipe will start moving with the sudden discharge of internal fluid. So, the various apparatus such as pipe whip restraints and jet deflectors are being installed near the postulated break location to protect the nuclear power plants against the effect of postulated pipe rupture. Pipe whipping test and jet discharge test are now being conducted at the Division of Reactor Safety of the Japan Atomic Energy Research Institute. The authors describe the test results of the jet discharge from a 4 inch pipe under BWR LOCA condition. In front of the pipe exit the target disk of 1000 mm in diameter was installed. The distance between the pipe exit and the target was 500 mm. 13 pressure transducers and 13 thermocouples were mounted on the target disk to measure the pressure and temperature increase due to jet impingement on the target.

65578 Analysis of PKL Test K9 by THYDE-P Code (CSNI ISP No.10 and THYDE-P sample calculation run 70). S.Kosugi, S.Sasaki, Y.Asahi.
Report JAERI-M-82-115, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Sept. 1982), 69 pp.
An analysis of PKL Test K9 is made by the THYDE-P code. Test K9 is the Standard Problem No.10 of Committee on the Safety of Nuclear Installations (CSNI) in the Nuclear Energy Agency (NEA), OECD. The objective of Test K9 is to investigate gravity-feed refill and reflood processes following a double-ended guillotine break in a cold leg with emergency cooling water being injected into the intact cold legs. THYDE-P is a code to analyze both the blow-down and refill-reflood phases of loss-of-coolant accidents (LOCAs) of pressurized water reactors (PWRs). In this report, calculated results are compared with the experimental data and discussed for the purpose of verification study and model development of THYDE-P. A good agreement with the experimental data was obtained using the best estimate (BE) options. (19 refs.)

65579 LOBI - Influence of PWR primary loops on blowdown. First results. W.L.Riebold, H.Stadtke.
Report EUR 6975 EN, Comm. European Communities, Luxembourg (1983), 67 pp.
The LOBI test facility and the experimental programme are described with particular emphasis on the test facility design rationals and the programme objectives. The future small break test programme and the test facility modifications required for these tests are briefly referred to. The present status of the LOBI project is outlined by summarizing the four test series performed so far which were concerned with large break A1-tests, with small break scoping tests, and with large break A2- and B-tests in the framework of an interim test programme; all these tests were executed with the large downcomer. The fourth series presently being performed is concerned with large break A1-tests with the small downcomer. Analysis results are presented of the comparison between prediction and experimental data of the very first LOBI test A1-04 which was used for a special, blind post-test prediction exercise with international participation (LOBI PREX). (9 refs.)

65580 Simulation of transients in light water reactors—desire and reality. W.Frisch (Gesellschaft fur Reaktorsicherheit, Forschungsgelande, Garching, Germany).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.95-7 vol.4
The area of transients in light water reactors is taken as an example to discuss some essential items concerning the relation between requirements and technical realisation of simulation tasks as well as the interactions between physical modelling and mathematical solution methods. Specific examples mentioned for demonstration are selected from work performed in the Federal Republic of Germany because of the author's easier access to specific details. However, general aspects should also apply to other countries. Examples are taken from the area of nonLOCA-transients, which are characterized by multiple feedback between physical processes and controlling systems. (9 refs.)

65581 Flammability behaviour and pressure development of hydrogen mixtures in containment volumes. M.Hertzberg, K.L.Cashdollar (Pittsburgh. Res. Center, Bur. of Mines, Pittsburgh, PA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.29-37 vol.1
The flammability behaviour of any premixed gas is quantifiable in terms of a limiting mathematical surface in a thermodynamic state-space whose independent variables are the initial compositions, the initial temperature, and the initial pressure. That limiting geometric surface in state-space separates a domain of flame propagation within from a region outside of the mathematical surface where flame propagation is not possible in the normal earthly environment. The region of physical space of concern is the air volume within the containment building of a nuclear reactor. Hydrogen and steam can flow into that air volume as a result of a loss-of-coolant accident similar to the one that occurred at Three Mile Island. The authors present a general review of current knowledge of the 'size' and 'shape' of the flammability surface. (13 refs.)

65582 Thermal-hydraulics of valves for nuclear applications. D.W.Sallet (Dept. of Mech. Engng., Univ. of Maryland, College Park, MD, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.111-34 vol.1
Thermal hydraulic aspects of valves used in nuclear power plants are discussed. Emphasis is given to the review of recent work on safety and pressure relief valves including the presentation of some of the author's own experimental results describing one- and two-phase flow through such valves. Measurements of internal flow fields are presented. Significant flow separation occurs in both the safety and the pressure relief valves. An experimental study using high speed photography to determine vaporization sites in safety valves when the flowing medium is initially a compressed liquid is described. A new method of estimating the observed decrease in valve coefficient when choked vapor flow changes to liquid flow is developed. This method also permits the prediction of the observed dependence of the valve coefficient on the receiver pressure in the choked and unchoked flow regimes. The fluid dynamic phenomena which lead to valve disc vibrations are discussed. (32 refs.)

65583 Applications of the RELAP5 code to the station blackout transients at the Browns Ferry Unit one plant. R.R.Schultz, S.R.Wagoner (Idaho Nat. Engng. Lab., EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.530-6 vol.1
As a part of the charter of the Severe Accident Sequence Analysis (SASA) Program, station blackout transients have been analyzed using a RELAP5 model of the Browns Ferry Unit 1 Plant. The task was conducted as a partial fulfillment of the needs of the US Nuclear Regulatory Commission in examining the Unresolved Safety Issue A-44: Station Blackout. (1) The station blackout transients were examined (a) to define the equipment needed to maintain a well cooled core, (b) to determine when core uncovery would occur given equipment failure, and (c) to characterize the behavior of the vessel thermal-hydraulics during the station blackout transients (in part as the plant operator would see it). (6 refs.)

65584 Analysis of loss of feed water ATWS transients. J.T.Robinson, B.R.Sehgal, N.Todreas (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.537-50 vol.1
Analysis of Anticipated Transients Without Scram (ATWS) forms an important part of the assessment of the safety of Pressurized Water Reactors (PWRs). The loss of feed water anticipated transient, in which the secondary side of the steam generators suffers a boil-off, leads to high temperatures and high pressures in the primary system. The prediction of the course of this ATWS transient is the subject of this paper. A simple computer code based on lumped parameter modeling has been developed to predict the transient pressures and temperatures. The results compare very well with those obtained from the RETRAN code. The computer run time is approximately 1/15th of the transient real time. (7 refs.)

65585 Analysis of station-blackout-ATWS with respect to surgeline pressure drop. H.Fulfs (Inst. fur Anlagentech., GKSS-Forschungszentrum Geesthacht, Geesthacht, Germany).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.551-5 vol.1
The analysis is based on a station-blackout transient without scram of a 1300 MW_e PWR reference plant and has been performed with the German plant code ALMOD 3, which special purpose it is to calculate the system behavior during transients with large deviations of process variables from normal operating conditions. The investigations have been restricted to the first 60 seconds of the transient, where the maximum values of system pressure and mass flow through the surgeline and the relief as well as the safety valves occurred. As the geometry of the surgeline is rather complex and two-phase flow has to be expected the item of this study is to quantify the influence of the surgeline pressure loss upon the system behavior. It is found, that—depending on the burn-up status—the peak values of pressure and pressure gradient as well as the behavior of the pressure control system are very sensitive to the used pressure loss coefficients. (7 refs.)

65586 RELAP5/MOD1 analysis of turbine trip test 1 at Peach Bottom Unit 2. J.C.Wells, R.K.House (Intermountain Technol. Inc., Idaho Falls, ID, USA), P.G.Bailey.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.556-61 vol.1
The RELAP5/MOD1, Cycle 14 thermal-hydraulics code was used for analysis of turbine trip transient 1 (TT1) conducted at Peach Bottom Atomic Power Station Unit 2. The goals were to evaluate the capability of RELAP5/MOD1 for BWR plant transient analysis and to evaluate the adaptability of RETRAN input models for use in RELAP5. The RELAP5/MOD1 input model used in the evaluation was derived from an existing RETRAN input model of Peach Bottom. Alteration of the RETRAN input model was required because of differences between the codes. Modification of the RELAP5/MOD1, Cycle 14 code was also required to permit effective modeling of jet pumps and the steam separator. The results obtained with the RELAP5/MOD1, Cycle 14 code were in good agreement with the test data. Additional RELAP5 calculations were performed to determine the sensitivity of the results to variations in selected input parameters. (6 refs.)

65587 TRAC analysis of steam generator overfill transients for TMI-1. B.Bassett (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.562-70 vol.1
A reactor safety issue concerning the overfilling of once-through steam generators leading to combined primary/secondary blowdown has been raised recently. A series of six calculations, performed with the LWR best-estimate code, TRAC-PD2, on a Babcock & Wilcox Plant (TMI-1), was performed to investigate this safety issue. The base calculation assumed runaway main feedwater to one steam generator causing it to overfill and to break the main steam line. Four additional calculations build onto the base case with combinations of a pump-seal failure, a steam-generator tube rupture, and the pilot-operated relief valve not reseating. A sixth calculation involved only the rupture of a single steam-generator tube. The results of these analyses indicate that for the transients investigated, the emergency cooling system provided an adequate make-up coolant flow to mitigate the accidents. (3 refs.)

65588 Simulation of LOFW transient during the TMI-2 accident. J.Kornfilt, J.C.Lee, W.R.Martin (Dept. of Nuclear Engng., Univ. of Michigan, Ann Arbor, MI, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.571-7 vol.1
A computer model to simulate the transient behavior of a nuclear steam supply system (NSSS) for a pressurized water reactor has been developed. This plant model incorporates the detailed non-linear steam generator model contained in the TRANSG-1 code along with models for the remaining NSSS components. The overall model, incorporated as the TRANSG-P code, has been used to analyze the plant response in the first thirty seconds of the Three Mile Island Unit 2 (TMI-1) accident. The flow channel and pressurizer models were verified by simulating the transient behavior of a once-through boiling channel test and a pressurizer transient, respectively. The entire plant model of the TRANSG-P code was then used to simulate the NSSS performance for the loss-of-feedwater flow transient at the start of the TMI-2 accident. A comparison of the calculated results with the available data leads to the conclusion that the code is capable of simulating severe transients with reasonable accuracy. (17 refs.)

65589 Loss-of-Fluid Test findings in pressurized water reactor core's thermal-hydraulic behavior. M.L.Russell (EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.578-87 vol.1
Summarizes the pressurized water reactor (PWR) core's thermal-hydraulic behavior findings from experiments performed at the Loss-of-Fluid Test (LOFT) Facility at the Idaho National Engineering Laboratory. The potential impact of these findings on the safety and economics of PWR's generation of electricity is also discussed. Reviews of eight important findings in the core's physical behavior and in experimental methods are presented with supporting evidence. (22 refs.)

65590 Development of a real time PWR accident simulator and its application for TMI-LOCA analysis. H.Yoshikawa, J.Wakabayashi, K.Tokura, K.Ito (Inst. of Atomic Energy, Kyoto Univ., Kyoto, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.595-603 vol.1
A fast-running (faster-than-real-time) PWR accident simulator program TOKRAC has been developed which is capable of tracing a long-time transient such as small-break LOCA. TOKRAC consists of two calculational modules: primary loop fluid dynamics and reactor core thermal analysis. The former is based on a single loop, one-dimension homogeneous flow model, while the latter is based on a single channel model. The fast-running capability of TOKRAC is, in addition to the above-mentioned model simplification, improved by using some numerical techniques to reduce calculational steps in both modules, and by replacing key plant variable(s) as externally given input. The calculation accuracy and fast-running capability were checked by applying TOKRAC for a simulation of TMI-2 accident. The comparison of the TOKRAC calculation with predictions by other codes and the actual plant record revealed that TOKRAC well predicts the major events with a computer time much faster than the real physical time. (10 refs.)

65591 Total nuclear plant simulation in real time. P.W.Wyatt, S.Kumar (Westinghouse Electric Corp., Pittsburgh, PA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.604-12 vol.1
The importance attached to nuclear safety analysis has led to the development of many large, sophisticated thermal-hydraulics codes. These codes, however, are in general, not suitable for use with the small computers used in reactor simulator application. They cannot operate in real time on such machines. But the need to respond to increasing demands for simulation fidelity and the upgrading of the simulator from a training device to an engineering tool necessitate a new approach to simulator modeling. The modeling is now required to increase in sophistication such that two-phase flow, reverse flow, stratification, condensation, evaporation, water hammer, and natural circulation are described by incorporating a small thermal-hydraulics code in the simulator. Various analytical techniques are used to run in real time with a minimum of nodes. Such a drift-flux model of the reactor coolant system, steam generators and steam header, plus associated auxiliary systems, is described. (8 refs.)

65592 Pre-test prediction of the TMI-1 turbine trip start-up test transient. P.S.Smith (GPU Nuclear Corp., Parsippany, NJ, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.613-22 vol.1
In support of the power escalation testing program leading to the restart of Three Mile Island Unit 1 (TMI-1), several analyses were performed using the RETRAN thermal hydraulics code. These analyses provided predictions for the plant response during the tests and served to aid in training of the plant operators and plant staff. This paper describes the analyses conducted to predict the plant response to a turbine trip from full power. (4 refs.)

65593 Unmitigated boron dilution events in a PWR. R.J.Henninger, S.B.Woodruff (Energy Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.623-30 vol.1
Dissolved boron is required for control of reactivity in a pressurized water reactor that is shut down. TRAC-PF1 calculations for a typical PWR for vessel-closed and vessel-open configurations show that a high-power excursion (approaching 20% of nominal operating power) is possible if dilution of the boron solution occurs. The calculations also show that sufficient heat capacity exists in the primary system to prevent a large temperature increase and that natural circulation flow of high concentration boron solution from the primary system into the core region will terminate the excursion. (2 refs.)

65594 Effects of the reactor coolant pumps after a small break in a Westinghouse reactor. J.L.Elliott (Energy Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.631-5 vol.1
TRAC-PD2 calculations indicate that more liquid remains in the system when the reactor coolant pumps are left in operation following a 4-inch-diameter cold-leg break in a Westinghouse plant. The analyses were performed to help determine whether to trip the pumps at high-pressure injection initiation, to trip the pumps at some later time in the transient, or to leave the pumps operating indefinitely. The loop seals behavior and the system refill characteristics led to a lower system mass when the pumps were tripped at HPI initiation. No cladding temperature increase occurred in any transient analyzed, however. (no refs.)

65595 Reflood experiments in the REWET-II rod bundle facility including comparisons with computer calculations. T.Kervinen (Nuclear Engng. Lab., Tech. Res. Centre of Finland, Helsinki, Finland), A.Hamalainen, J.Miettinen.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.638-45 vol.1
A series of reflooding experiments has been carried out in the REWET-II facility. The primary objective of these tests was to study the effect of the combined upper plenum and downcomer coolant injection and to provide data for verification of computer codes. The experimental results indicate that upper plenum injection alone cools test rods slowly, a combined coolant injection to the upper plenum and the downcomer improves cooling significantly, and downcomer injection alone cools the test rod bundle best if the total coolant flow rate is the same in these three different cases. In all of these cases the lower plenum was full of coolant at the start of the experiment. Quenching time and clad temperature histories calculated with the computer codes NORCOOL-I and FLOOD4 are in reasonable quantitative agreement

with experiments in the case of pure downcomer injection. Qualitative trends were reasonably predicted in other cases, too. (6 refs.)

65596 FLECHT-SEASET 21-rod bundle flow blockage heat transfer during reflood. M.J.Loftus, L.E.Hochreiter, N.Lee (Westinghouse Nuclear Technol. Div., Pittsburgh, PA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.646-56 vol.1
The effect of various flow blockage shapes and distributions during a PWR reflood was investigated using six 21-rod bundles with full length, internally heated, cosine power-shaped electrical rods. The flow blockage shapes, simulating the fuel rod clad ballooning, were made of thin-wall stainless steel tubes hydroformed into a short, concentric shape and long, nonconcentric shape. The blockage sleeves were distributed both coplanar, with all sleeves located at the same elevation, and noncoplanar. The initial and boundary conditions were varied to include parametric effects of pressure, inlet water temperature, and primarily, flooding rate. The initial mid-plane rod temperature was 871°C (1600°F) in all tests. (12 refs.)

65597 Investigation of radial power and temperature effects in large-scale reflood experiments. F.Motley (Energy Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.657-63 vol.1
The largest reflood test facility in the world has been designed and constructed by the Japan Atomic Energy Research Institute. The experimental test facility, known as the Cylindrical Core Test Facility, models a full-height core section and the four primary loops of a Pressurized Water Reactor. The radial power distribution and temperature distribution were varied during the testing program. The test results indicate that the radial effects, while noticeable, do not appreciably alter the overall quenching behavior of the facility. The Transient Reactor Analysis Code (TRAC) correctly predicted the experimental results of several of the tests. The code results indicate that the core flow pattern adjusts multi-dimensionally to mitigate the effects of increased power or stored energy. (4 refs.)

65598 Fluid dynamic effects in the fuel element top nozzle area during refilling and reflooding. A.Hawighorst, H.Kroning, F.Mayinger (Inst. fur Verfahrenstech., Univ. Hannover, Hannover, Germany).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.664-73 vol.1
At an unheated 4×4 rod bundle air/water test facility optical investigations of the entrainment behavior and counter current flow experiments were performed with a large variety of test conditions. It was found that the type of injection has only a weak influence whereas the geometrical conditions upstream of the narrowest flow area (presence of bundle, grid spacer) have an important effect on the flooding behavior. In addition a comparison of the applicability of different flooding models shows that only the models based on dimensionless numbers expressed by superficial velocities, show a good agreement with the own experimental data. (21 refs.)

65599 The effect of inlet flow oscillations on reflooding of a tubular test section. S.Oh, S.Banerjee, G.Yadigaroglu (Dept. of Chem. & Nuclear Engng., Univ. of California, Berkeley, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.674-80 vol.1
The reflooding of a vertical channel under oscillatory inlet flow conditions has been investigated experimentally. Compared to constant injection, oscillations always increase the liquid carryover in the early stages of reflooding. As reflooding progresses, the enhancement diminishes. The crossover point roughly coincides with saturation of the liquid at the quench front (QF). The higher liquid carryover at the beginning increases downstream heat transfer and speeds up QF propagation. But this higher liquid carryover, in turn, reduces the test section mass accummulation rate and delays QF propagation at later stages. The enhancement of liquid carryover, and the early increase and subsequent decrease in quench velocity are all accentuated as the oscillation amplitude and frequency increase. Large amplitude oscillations change the characteristics of QF propagation and the heat transfer immediately downstream of QF substantially. Correlations based on constant-injection reflooding data are not adequate, even if they are applied on an average local-conditions basis. (16 refs.)

65600 Condensation effects in large scale BWR safety experiments. W.A.Sutherland (General Electric Co., San Jose, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.681-9 vol.1
Experiments addressing thermal hydraulic phenomena under Loss-of-Coolant-Accident (LOCA) conditions have been conducted in a full scale 30 degree sector mock-up of the Boiling Water Reactor (BWR). The test program included both steady pressure and transient LOCA simulation, at system pressure up to ten atmospheres, and covered both specific thermal hydraulic phenomena and system response under blowdown/refill/reflood conditions. Condensation effects observed in these experiments contributed to the effective system refill/reflood performance. Two condensation effects of particular interest are core spray injection leading to localized subcooling in the upper plenum that breaks down counter-current flow limiting at the top of the core, and low pressure coolant injection leading to subcooling in the lower plenum that reduces liquid flow out the jet pumps. Both of these effects augment plenum refill and core reflood. (12 refs.)

65601 TRAC analysis of radial power distribution effects on forced-feed reflood experiments. R.K.Fujita (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.690-4 vol.1
TRAC thermal-hydraulic computer program predictions were compared with transient forced-feed reflood experiments. Three forced-flooding, large-scale reflood tests were analyzed to investigate the effect of the radial power distribution on the reflooding behavior of an electrically heated core. TRAC predicted the trends of the data quite well, including the multidimensional hydraulic effects observed in the tests. The variations in the radial power profile did not significantly affect the overall quenching of the core. (no refs.)

65602 Two fluid modelling of the LWR core uncovery transients. C.K.Tsai, B.R.Sehgal, M.S.Kazimi (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.695-704 vol.1
The core uncovery (boil-off) transient was studied with a two fluid model for two-phase flow. The objective was to delineate the effects of thermal and mechanical nonequilibrium and multidimensional geometry on the prediction of the two-phase mixture level. Analyses of three sets of experiments (FLECHT-SEASET, Westinghouse 336-rod bundle and semiscale TMI-2 simulation) were performed with the MIT developed two fluid model code THERMIT. It was found that differences in the interfacial momentum-exchange models employed greatly affected the predicted time variation of the two-phase level during the transient. The influence of the thermal nonequilibrium was not as great. The results also showed only small differences between the three-dimensional and one-dimensional calculations for the PWR geometry. (25 refs.)

65603 Application of analytical capability to predict rapid cladding cooling and quench during the blowdown phase of a large break loss-of-coolant accident. S.N.Aksan (Swiss Federal Inst. for Reactor Res., Wuerenlingen, Switzerland), E.L.Tolman, P.A.Nelson.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.705-12 vol.1
Large-break experiments L2-2 and L2-3 conducted in the loss-of-fluid test (LOFT) facility experienced core-wide rapid quenches early in the blowdown transients. To further investigate rapid cladding quenches, separate effects experiments using Semiscale solid-type electric heater rods were conducted in the LOFT test support facility (LTSF) over a wide range of inlet coolant conditions. The analytical capability to predict the cladding temperature response from selected LTSF experiments estimated to bound the hydraulic conditions causing the LOFT early blowdown quenches was investigated using the RELAP4 computer code and was shown to be acceptable over the film boiling cooldown phase. This analytical capability was then used to investigate the behavior of nuclear fuel rods under the same hydraulic conditions. The calculations show that under rapid cooling conditions the behaviors of nuclear and electrical heater rods are significantly different because the nuclear rods are conduction limited, while the electrical rods are convection limited. (20 refs.)

65604 Analytical study of BWR upper plenum behavior under LOCA by TRAC-BD1. N.Abe, M.Katoh (Nuclear Res. Lab., Nippon Atomic Industry Group Co. Ltd., Tokyo, Japan), H.Nagasaka, H.Aoki.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.713-17 vol.1
Describes analytical results of BWR upper plenum behavior under LOCA using the TRAC-BD1 code and comparisons with ESTA (eighteen degrees sector test apparatus) results. TRAC-BD1 is a best estimate system code and features a three dimensional treatment of the BWR pressure vessel and one dimensional treatment of fuel bundles and pipings. ESTA is the LOCA refill-reflood test facility which mocks up an 18 degrees sector of the BWR with full height from jet pump bottom to standpipe top. Analyses of ESTA saturated CCFL test and subcooled CCFL breakdown tests are performed by using the TRAC-BD1 code with special emphasis on multidimensional nonequilibrium two phase flow behavior in the upper plenum associated with CCFL and CCFL breakdown at the upper tie plate. It is confirmed that TRAC-BD1 can predict not only the multi-bundle saturated CCFL characteristics but the effect of spray temperature on CCFL breakdown qualitatively. (2 refs.)

65605 Posttest analysis of Semiscale Tests S-UT-6 and S-UT-7 using TRAC-PF1. B.E.Boyack (Safety Code Dev. Group, Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.718-25 vol.1
A posttest study of Semiscale Tests S-UT-6 and S-UT-7 has been completed to assess TRAC-PF1 predictions of pressurized water-reactor (PWR) small-break transients. The comparisons of the TRAC calculations and experimental results show that the correct qualitative influence of upper-head injection was predicted. The major phenomenological difference was the underprediction of break flow during subcooled and two-phase blowdown. (8 refs.)

65606 Large break integral test with the Two Bundle Loop and post-test analysis by RELAP5/MOD1. T.Matsumoto, M.Murase, M.Naitoh (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan), T.Gomyoo.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.726-30 vol.1
Simulation tests of a BWR loss of coolant accident (LOCA) were conducted in the Two Bundle Loop (TBL) to obtain blowdown and emergency core cooling (BD/ECC) data and evaluate the parallel channel effect with different bundle powers. The simulations indicated that the flow paths for falling water and updraft steam were separated in the two bundles after the termination of the lower plenum flashing. The flow separation was induced by counter current flow limitation (CCFL) at bundle inlets and outlets. The heatup initiation of rods was early and localized in the bundle with much falling water, while it was delayed in the bundle with much updraft steam. Post test analysis was performed using RELAP5/MOD1 to evaluate its capability for prediction of transient responses in the two bundles. (8 refs.)

65607 An experimental study of blowdown thrust and jet forces by 6-inch pipe under BWR LOCA. T.Yano, T.Isozaki, S.Ueda, N.Miyazaki, R.Kurihara, R.Kato, S.Miyazono (Div. of Nuclear Safety Res., JAERI, Ibaraki-ken, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.761-8 vol.2
The blowdown thrust and jet impingement forces are examined simultaneously in the jet discharge tests relating to the instantaneous pipe rupture accident. The tests were performed with a 6-inch pipe under the BWR LOCA conditions. The initial pressure of the hot saturated water was 6.86 MPa. The following items are made clear: (1) the time history of the blowdown thrust force just after the break, (2) the jet thrust parameter of the pipe, (3) the jet impingement force, (4) the pressure and temperature distributions of the impinging jet and (5) the relationship between the thermalhydraulic quantities and the thrust forces. (11 refs.)

65608 Fuel temperature excursions during accidents with degraded cooling in CANDU reactors. A.P.Muzumdar, C.Blahnik, J.H.K.Lau, G.H.Archinoff (Nuclear Studies & Safety Dept., Ontario Hydro, Toronto, Ontario, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.896-903 vol.2
Describes the methods employed to derive conservative fuel temperature transients during degraded cooling scenarios in CANDU reactors, and presents examples of the results obtained. The analysis is performed using an axially segmented fuel channel model with the fuel bundle assemblies represented by a ring model. All basic modes of heat transfer in a steam environment are accounted for, but no undue credit is taken for heat removal from the fuel. For example, in a loss-of-coolant scenario coincident with a loss of emergency injection, a steam flow rate is defined which maximizes the exothermic Zircaloy-water reaction, while minimizing convective heat removal from the fuel. Other relevant phenomena, such as the effects of geometry distortion on heat transfer paths are also accounted for. It is shown that the moderator acts as an effective heat sink that limits fuel temperatures to well below the melting point of UO$_2$. (4 refs.)

65609 Prediction of critical flow rates through power-operated relief valves. D.Abdollahian (S. Levy Inc., Campbell, CA, USA), A.Singh.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.912-18 vol.2
Existing single-phase and two-phase critical flow models are used to predict the flow rates through the power-operated relief valves tested in the EPRI Safety and Relief Valve test program. For liquid upstream conditions, Homogeneous Equilibrium Model, Moody (1965), Henry-Fauske (1971) and Burnell (1947), two-phase critical flow models are used for comparison with data. Under steam upstream conditions, the flow rates are predicted either by the single-phase isentropic equations or the Homogeneous Equilibrium Model, depending on the thermodynamic condition of the fluid at the choking plane. The results of the comparisons are used to specify discharge coefficients for different valves under steam and liquid upstream conditions and to evaluate the existing approximate critical flow relations for a wide range of subcooled water and steam conditions. Some widely used simplified correlations to predict steam discharge flow rates through values are also evaluated against the data and other models. (12 refs.)

65610 Valve qualification for normal and accident conditions in LWRs. B.Dernbach, K.Riedle, U.Simon (Kraftwerk Union AG, Erlangen, Germany).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.919-28 vol.2
Following a brief description of KWU's valve testing facilities the experimental qualification of safety and relief valves for BWRs and PWRs is presented. Both are pilot operated valves and were originally designed for steam flow but have to function also for water and two-phase flow under accident conditions. The tests showed excellent operability of the valves with steam flow. With water the required function was achieved after modifying the cross section and the pressure drop from and to the control volume in the main valves. (3 refs.)

65611 On the stability of a coupled safety valve-piping system. A.Singh (Electric Power Res. Inst., Palo Alto, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.929-37 vol.2
Spring-loaded self-actuating safety valves are employed as part of the overpressure protection systems in various industrial applications. Some safety valve installations may consist of an upstream piping connecting the valve to the vessel and a downstream discharge piping. The effect of these piping systems on the valve performance, especially with regard to the stability on valve opening and closing are investigated in the present study. Possible mechanisms for valve instability are identified based on the pressure fluctuations upstream and downstream of the valve caused by the valve opening and closing. A simplified method to evaluate the magnitude of upstream pressure fluctuations in a constant area pipe and for steam discharge conditions is presented and shown to predict the available data conservatively. Simplified criteria for the valve stability during opening and closing are defined using the predicted upstream pressure fluctuation. (4 refs.)

65612 An analysis of flow induced oscillations in safety valves. K.S.Howe (Westinghouse Electric Corp., Pittsburgh, PA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.938-44 vol.2
A dynamic spring loaded safety valve model has been developed which is coupled to a one dimensional hydraulic code. The two dimensional flow equations are transformed into one dimensional equations with a two dimensional auxiliary equation to correct for the pressure gradient. This model has been applied to valve opening problems under either steam or water conditions. Sample test comparisons with EPRI test program data are included along with a short parametric study. (6 refs.)

65613 A mechanistic hydrodynamics model for the simulation of BWR jet pumps during normal and off-normal operation. J.W.Spore (EG&G Services Inc., Idaho Falls, ID, USA), L.Greenley.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.945-55 vol.2
A mechanistic hydrodynamics model of a BWR jet pump has been developed and tested in CDC's version of the RELAP5/MOD1 computer program. The model has been tested against 1/6th scale single-phase and two-phase data and against full-scale jet pump data. The data comparisons indicate that the model represents well the relevant hydrodynamic phenomena that occurs in a BWR jet pump during normal and off-normal operation. (8 refs.)

65614 Experimental study of two-phase, two-component flow in centrifugal pumps. J.J.Manzano-Ruiz (EPIG Section, INTEVEP, Miranda, Venezuela), D.G.Wilson.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.956-64 vol.2
A test rig was built to run steady-state experiments with air/water mixtures at low pressure (42 kPa), and to determine the performance characteristics of two-phase flow through a centrifugal pump. The present work would find its application in a possible loss-of-coolant-accident situation in nuclear-reactor power plants, if a large break in one of the primary-pump legs takes place. Two feasible accident conditions were tested; they are called first- (forward flow and rotation) and third-quadrant (reverse flow and rotation) conditions. A significant head-pump degradation process was observed in the first-quadrant operation for increasing amounts of gas supplied, whereas in the third quadrant no difference in performance was detected with respect to single-phase flow and up to an inlet volumetric quality of 20%. The data gathered have been correlated in terms of a defined head-loss ratio, flow coefficient and volumetric quality, which facilitates its use in predicting pump performance in similar designs of different scale. (30 refs.)

65615 FRAP-T6 uncertainty study of LOCA tests LOFT L2-3 and PBF LLR-3^a. R.Chambers, W.E.Driskell, S.C.Resch (Idaho Nat. Engng. Lab., EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.965-71 vol.2
Presents the accuracy and uncertainty of fuel rod behavior calculations performed by the transient Fuel Rod Analysis Program (FRAP-T6) during large break loss-of-coolant accidents. The accuracy of the code was determined primarily through comparisons of code calculations with cladding surface temperature measurements from two loss-of-coolant experiments (LOCEs). These LOCEs were the L2-3 experiment conducted in the Loss-of-Fluid Test (LOFT) Facility and the LOFT Lead Rod 3 (LLR-3) experiment conducted in the Power Burst Facility (PBF). Uncertainties in code calculations resulting from uncertainties in fuel and cladding design variables, material property and heat transfer correlations, and thermal-hydraulic boundary conditions were analyzed. Overall, heat transfer correlations and coolant boundary conditions were much more important than fuel rod input parameters in contributing to uncertainties in fuel temperature calculations. Coolant enthalpy was by far the largest contributor to calculation uncertainty. (28 refs.)

65616 Ring grid spacer pressure loss: experimental study and evaluation method. A.Ito, K.Mawatari (Toshiba Corp., Kawasaki, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.972-8 vol.2
For lack of correlation between grid spacer pressure loss and S_g/S_f, H_g/D_g, spacer element location in the flow cell and spacer element edge shape, it is impossible to design a grid spacer whose pressure loss is as low as that for the wire spacer. For work and assembly ease, the ring grid spacer was selected as a candidate for an LMFBR low pressure loss grid spacer. A series of hydraulic experiments were carried out to study the pressure loss characteristics for ring grid spacers with 0.11, 0.18 and 0.21 mm thick grid elements, 5, 10, 15 and 20 mm grid element heights, and 7°, 15° and 30° outer/inner taper angles on both grid element edge corners. To consider strength and pressure loss, desirable ring grid spacer design is $H_g/D_g \approx 15$, $S_g/S_f \approx 0.8$, $\theta \approx 7°$. (15 refs.)

65617 Flow behavior in a stationary vane centrifugal separator—simulation experiments and analysis. S.P.Kalra (Safety & Analysis Dept., Electric Power Res. Inst., Palo Alto, CA, USA), L.S.Yao, W.E.R.Davies.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.979-87 vol.2
The liquid and vapor phase distributions in a scaled model of a static vane centrifugal separator were studied. A range of two-phase loading conditions were simulated in an air-water loop facility. The measurements of local velocities and voids were performed. High-speed flow visualization has been applied in order to provide feedback to the model and analytical tool development. The flow behavior sensitivity on the efficiency of separator is discussed. (6 refs.)

65618 Numerical simulation of thermal and fluid mixing in the cold leg and downcomer of a model geometry during a PWR primary side overcooling. Ching-Lu Lin, J.H.Kim, B.K.H.Sun (Electric Power Res. Inst., Palo Alto, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.988-96 vol.2
The thermal and fluid mixing in the cold leg and downcomer is investigated by using the COMMIX-1A computer code. The code prediction is compared with test data obtained in a model test geometry. The code prediction is shown to agree reasonably well with the test results. The mixing is shown to be enhanced as the loop flow to HPI flow ratio increases. At low loop flow to HPI flow ratio, it is shown that it takes a long time to reach the final steady-state equilibrium. The thermal transient in the downcomer is shown to be very mild everywhere throughout the period considered. (9 refs.)

65619 Thermal-hydraulic analysis of main-steam-line-break accidents as potential initiators for reactor vessel pressurized thermal shock. D.Lamkin (Energy Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.997-1005 vol.2
Results are presented from two thermal-hydraulic analyses of postulated main-steam-line breaks for the Oconee nuclear power plant. One calculation assumes runaway feedwater supply, whereas normal feedwater management is used in the other. The analyses were performed with the TRAC-PD2 code. The objective was to provide primary coolant temperature and pressure histories to assist in evaluating possible reactor-vessel pressurized-thermal-shock concerns. (3 refs.)

65620 Thermal-hydraulic analyses of pressurized-thermal-shock-induced vessel ruptures. D.Dobranich (Energy Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1006-11 vol.2
A severe overcooling transient was postulated to produce vessel wall temperatures below the nil-ducility transition temperature which, in conjunction with system repressurization, led to vessel rupture at the core midplane. Such transients are referred to as pressurized-thermal-shock transients. A wide range of vessel rupture sizes were investigated to assess the emergency system's ability to cool the fuel rods. Ruptures greater than approximately 0.015 m^2 produced flows greater than those of the emergency system and resulted in core uncovery and subsequent core damage. (4 refs.)

65621 Stability analyses of boiling water systems and steam generators. J.Kornfilt, J.C.Lee (Dept. of Nuclear Engng., Univ. of Michigan, Ann Arbor, MI, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1012-19 vol.2
The thermal-hydraulic codes TRANSG-1 and TRANSG-P have been used in the analysis of density wave oscillations (DWOs), which are among the most common of two-phase flow instabilities. The fluid flow model is based on one-dimensional nonlinear, single-fluid conservation equations of mass, momentum and energy, which are solved through an implicit finite-difference formulation. Simulation of DWOs in both once-through and natural-circulation boiling channels with the steam generator code TRANSG-1 indi-

cates good agreement with the test data. The pressurized water reactor system code TRANSG-P was used to simulate an overload condition for the D.C. Cook Unit 1 system. The primary loop was seen to have a negligible effect on the DWOs occurring in the steam generator. Comparisons of the TRANSG-1 and TRANSG-P simulations with simple linearized models led to the conclusion that the main mechanism behind DWOs in both once-through and natural-circulation boiling channels consists of delayed effects and the hydrodynamics boundary condition imposed on the channels. (17 refs.)

65622 Characteristics of PWR ice condenser containment during degraded core and full core meltdown accidents. J.W.Yang, W.T.Pratt (Dept. of Nuclear Energy, Brookhaven Nat. Lab., Upton, NY, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1022-30 vol.2
A study of hydrogen combustion and debris/water interactions in a Pressurized Water Reactor (PWR) ice condenser containment during postulated degraded core and full core meltdown accidents is presented. The study covers a wide range of accident sequences initiated by small break LOCA and transients. The MARCH computer code, with BNL modifications is used in the analysis. The results show that if hydrogen burning can be assured at low concentration, then containment failure is unlikely during the degraded core accidents considered. However, simultaneous hydrogen burning and debris/water interaction at vessel failure during full core meltdown accidents do potentially present a severe threat to the containment integrity. (9 refs.)

65623 The effect of steam bypass on ice condenser containment pressurization. G.A.Pertmer, K.K.Almenas, H.Dezfuli, Z.Jin (Nuclear Engng. Program, Univ. of Maryland, College Park, MD, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1031-8 vol.2
The PWR ice condenser containment utilizes a large mass of stored ice for pressure suppression after an accident. The containment has a smaller volume and a lower design pressure than a comparable PWR dry containment. In this study, the effect on containment pressurization due to steam bypassing the ice bays is analyzed. The CONTEMPT4 code, modified to include an implicit compartment mass transfer algorithm, is utilized. A seven compartment noding of an ice condenser containment is used, and active (sprays and heat exchangers) and passive (concrete and steel) heat sinks are modelled. Results are presented and analyzed for two primary system break sizes and three bypass leakage areas. (7 refs.)

65624 Containment response analysis in TRAC-BD1/MOD1. D.D.Taylor, M.M.Giles, W.L.Weaver,III (Code Dev. Div., EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1039-45 vol.2
The Boiling Water Reactor (BWR) version of the Transient Reactor Analysis Code (TRAC) is under development at the Idaho National Engineering Laboratory to provide an advanced best-estimate predictive capability for the analysis of postulated accidents in BWRs. The code now incorporates a containment thermodynamic response option whereby time-dependent fluid temperatures and pressures in the containment are estimated in order to supply boundary conditions for the primary cooling loop calculation. Implementation and details of the containment model are described herein. Comparisons of the TRAC predictions of containment fluid temperature and pressure response with data from three blowdown test facilities are presented. (6 refs.)

65625 Calculation of the thermal-hydraulic transient in multicompartment systems, by ARIANNA computer codes. N.Cerullo, M.Mazzini, F.Oriolo, S.Paci, A.Pasculli (Univ. of Pisa, Pisa, Italy), R.Romanacci.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1046-51 vol.2
A research program on the behaviour of containment systems has been carried out for a long time at the Istituto di Impianti Nucleari of the University of Pisa (IIN-Pisa), to set up a calculation model adequate for the analysis of the thermal-hydraulic transient following a LOCA. A computer code family, named ARIANNA, has been developed for this purpose. In order to verify and compare ARIANNA's modelling, the IIN-Pisa took part in the international exercises, sponsored by OECD-CSNI: Numerical Benchmark Problem and Containment Standard Problem (CASP) no.1, 2 and 3 The results of the authors' experience are presented and briefly analyzed. (8 refs.)

65626 Containment code verification by systematic evaluation of experimental data. H.B.Schwan (Inst. fur Anlagentech., GKSS-Forschungszentrum Geesthacht, Geesthacht, Germany).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1052-7 vol.2
Since 1970 experimental research focused on containment responses due to Loss of Coolant Accidents has been initiated by the Federal German Ministry of Research and Technology. These experiments—performed at several institutions—till now yielded confirmatory as well as unexpected data which gave rise to containment code improvement. Whereas the basic physical equations are common to all containment codes, separate effects as junction loss coefficients, junction flow liquid entrainment and condensation heat transfer often are treated in different ways, resulting in significant analytical deviations. Treatment of these separate effects in the containment code CORAN is briefly discussed and demonstrated in comparison with experimental results. (13 refs.)

65627 The multi-compartment-code 'WAVCO', developed to analyse the behaviour of non-condensables during hypothetical accidents. M.Fischer, K.Hassmann (Kraftwerk Union Aktiengesellschaft, Erlangen, Germany), H.H.Reineke, B.Wohler.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1058-63 vol.2
The objective of this project is to analyse whether local burning effects can result in a dangerous high loading of the containment shell. For such detailed burning considerations, the knowledge of the state of the atmosphere and the mixing of the different constituents is needed. Therefore the code 'WAVCO' has been developed in order to provide a flexible, physical and numerical model which is able to calculate the time-dependent thermodynamic behaviour of condensables and non-condensables in a multi-compartment PWR-containment. The code was designed to calculate slow, as well as very transient processes. The first part contains a detailed description of the physical phenomena considered and the numerical method used to solve the problem-related equation system. Finally, some results of the analysis of very transient accident are presented. (3 refs.)

65628 Development of new containment pressure transient analysis computer code and its application to core degraded/melt-down accident analysis. K.Okabe, Y.Amano, T.Kohriyama, Y.Furukawa (Mitsubishi Atomic Power Industries Inc., Tokyo, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1064-74 vol.2
A new computer code called ESTEEM was developed for the estimation of a PWR dry containment pressure and temperature transient in a hypothetical accident. ESTEEM can simulate a containment as a multi-node network and it can also treat the burning of non-condensable gases. It was applied to the analyses of the two containment experiments of a large scale spray depressurization at Japan Atomic Energy Research Institute and a pressurization at subcooled water blowdown at Battelle Frankfurt Institute. ESTEEM could simulate well the thermal-hydraulic behaviors in both the experiments. Analytical results by ESTEEM about the containment pressure transient of typical 1000 MWe PWR plant at the core melt accident are also presented, and the required researches as future works related to H_2 burning are summarized. (17 refs.)

65629 Transient flow through T-junctions. K.N.Tennankore, D.R.Greig (Atomic Energy of Canada Ltd., Pinawa, Manitoba, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1075-82 vol.2
A well-mixed transient-flow model for T-junctions has been developed from first principles. Based on a critical review of available steady-flow loss correlations and experimental data obtained in a laboratory, the most consistent set of correlations has been identified and recommended for the model. A transient gas-flow test facility for obtaining model verification data has been commissioned. Preliminary pressure data suggest that quasi-steady flow prevails during a significant fraction of the blowdown time. Thus, quasi-steady models such as that proposed are likely to be adequate. (6 refs.)

65630 Formulating a post accident temperature profile inside containment for the Oyster Creek BWR—approach and key parameter identification. N.G.Trikouros (GPU Nuclear Corp., Parsippany, NJ, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1083-93 vol.2
The NRC 'Guidelines for Evaluating Environmental Qualifications of Class IE Electrical Equipment in Operating Reactors' indicates that Boiling Water Reactors are to use 340°F (171°C) for 6 hours as the basis for judging whether individual component qualifications meet the guidelines. Some BWR licensees indicated that they might want to use plant specific analyses to justify less severe environmental conditions and thus to take exception to the guidelines. In this way, the technical issue of whether or not a plant specific analysis justifies less severe conditions than 340°F (171°C) for 6 hours was raised. The author provides a description of the work which was performed in fulfilment of the task of providing a plant specific containment temperature profile for the environmental qualification of equipment at Oyster Creek. The analytical methodology which was used, the analysis approach, and the analysis results, are described. In addition, the parameters which were most significant to the containment response characterization are identified and discussed. (9 refs.)

65631 Failure modes of a concrete nuclear containment building subjected to hydrogen detonation. L.E.Fugelso, T.A.Butler (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1094-101 vol.2
The calculated response for the Indian Point reactor containment building to static internal pressure and one case of a dynamic pressure representing hydrogen combustion and detonation are presented. Comparison of the potential failure modes is made. (14 refs.)

65632 Turbulent condensation on a cold wall in the presence of a noncondensable gas. M.Corradini (Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1102-10 vol.2
A condensation model for forced and natural convection is derived by extending the Reynolds-Colburn analogy for heat and momentum transfer to mass and momentum transfer. The model is compared to the steady state data of Uchida (1965) and Tagami (1965), and found to be in reasonable agreement with the forced convection data when an imposed velocity of two meters per second is assumed. The natural convection model derived has the same functional dependence on Grashof number ($h_{TOT} \sim Gr^{-.37}$) as the data of Akers (1960). (17 refs.)

65633 Containment condensing heat transfer. R.G.Gido, A.Koestel (Energy Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1111-19 vol.2
Presents a mechanistic heat-transfer model that is valid for large-scale containment heat sinks. The model development is based on (1) the determination that the condensation is controlled by mass diffusion through the vapor-air boundary layer, and (2) the application of the classic triple analogy to formulate expressions for the transfer of heat and mass based on hydrodynamic measurements of the momentum transfer. As a result, the analysis depends on the quantification of the shear stress (momentum transfer) at the interface between the condensate film and the vapor-air boundary layer. In addition, the currently used Tagami (1965) and Uchida (1965) test observations and their range of applicability are explained. (28 refs.)

65634 Research on the behaviour of Mark II pressure suppression containment system during LOCA, carried out at the University of Pisa. M.Carcassi, M.Mazzini, P.Vigni (Dipartimento di Costruzioni Meccaniche e Nucleari, Univ. of Pisa, Pisa, Italy).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1120-7 vol.2
A wide theoretical and experimental research, about the Mark II—General Electric Pressure Suppression Containment System (PSCS), has been carried out for a long time by the 'Istituto di Impianti Nucleari' of the University of Pisa. The aim of the research has been the investigation of the behaviour of PSCS during large LOCA and particularly during blow-down. The most important experimental results (pressure oscillations in the first phase of the transient, pressure maxima at the end of blow-down) are presented. The oscillatory behaviour in the first phase of the thermalhydraulic transient involved a review of the theoretical basis of the research. So a physical-mathematical model (implemented in SOPRE SD2 code) has been set-up; in

parallel, the problem of scaling laws related to this oscillation phase has been considered. As a general conclusion, the meaning of the research is presented, in relation to the behaviour of real Mark II systems following large LOCA. (13 refs.)

65635 Pressure oscillations in vent tubes induced by steam condensation in pressure suppression containment. H.Nariai (Inst. of Engng. Mech., Univ. of Tsukuba, Ibaraki, Japan), I.Aya.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1128-34 vol.2
Pressure oscillations in vent tubes during steam condensation in pool water were investigated with a simulation experiment for a pressure suppression containment. The test rig consists of a header with 0.005 m^3 volume simulating the drywell and a vent tube with the dimensions of either 18 mm inside diameter and 0.5 m long or 18 mm inside diameter and 0.8 m long. Patterns of pressure and fluid oscillations were classified into four regimes: large chugging, small chugging, condensation oscillation, and bubbling without high frequency component in oscillation. Modellings of the oscillations were conducted considering the changes of condensation rates around steam-water interfaces. The effects of water temperatures and average steam flow rates on the high frequency and also on the low frequency components in pressure oscillations both appearing in large chugging, in small chugging, and in condensation oscillation were investigated. (5 refs.)

65636 Steam density oscillations in two phase-two component flow. F.Sakkal, E.Aust (Inst. fur Anlagentech., GKSS-Forschungszentrum Geesthacht, Geesthacht, Germany).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1135-42 vol.2
The GKSS-Forschungszentrum is currently conducting a test program on a multivent BWR-related pressure suppression system. Main subject of this experimental R+D-work is to provide definitive information about the function and the effectiveness of a pressure suppression containment under loss-of-coolant accident conditions. During the performed tests density oscillations have been observed inside the used vent pipes, caused by condensation effects, which mainly influence the two phase-two component flow through the vent pipes. The saturated steam density of this flow was determined by measuring the transmission intensity of an infrared beam. It can be stated that the used infrared measurement with respect to its sensitive principle allows a very sensible evaluation of steam density oscillations with detailed information about the nature of the analysed two phase-two component flow. (4 refs.)

65637 Evaluation of LOCA hydrodynamic loads for BWR Mark-II containments caused by steam condensation. T.Hattori, Y.Tanaka (Tokyo Electric Power Co., Tokyo, Japan), M.Arinobu, E.Shiho, H.Aoki, M.Utamura, K.Moriya, O.Oyamada.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1143-8 vol.2
In the case of a postulated loss of coolant accident for a boiling water reactor (BWR), steam is injected into water and condenses in the pressure suppression pool. The condensation phenomena cause dynamic loads on the pool boundary. The dynamic load evaluation methodology has been developed for the condensation phenomena called condensation oscillation and chugging for BWR Mark-II containments. The load evaluation methodology is based on an analytical model and on the seven vent full scale test results performed by Japan Atomic Energy Research Institute. The random nature of the phenomena has been considered in load evaluation for condensation oscillation as well as for chugging. The evaluated loads due to condensation oscillation are markedly small, compared with those due to chugging. Examples of evaluated loads due to both phenomena are shown for a typical Mark-II containment. The so-called fluid structure interaction effects on the base data have also been examined and discussed. (7 refs.)

65638 An analysis of multiple bubble behaviors in a BWR suppression pool. M.Utamura (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1149-54 vol.2
Dynamics of a multiple bubble system in a BWR suppression pool have been studied considering interactions between bubbles. Based on the potential flow theory, these dynamic interactions have been expressed assuming spherical bubbles. Extension to an arbitrary pool configuration has been made by use of the boundary element method. Numerical results for air bubble oscillation have shown that the interactions cause frequency and magnitude to decrease provided the bubbles oscillate in phase. Experimental verification has also been carried out using simulated air bubbles. (4 refs.)

65639 Analysis of the Three Mile Island (TMI-2) hydrogen burn. J.O.Henrie, A.K.Postma (Rockwell Hanford Operations, Richland, WA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1157-70 vol.2
As a basis for the analysis of the hydrogen burn which occurred in the Three Mile Island Containment on March 28, 1979, a study of recorded temperatures and pressures was made. Long-term temperature information was obtained from the multipoint temperature recorder which shows 12 containment atmosphere temperatures plotted every 6 min. The containment atmosphere pressure recorder provided excellent long- and short-term pressure information. Short-term information was obtained from the multiplex record of 24 channels of data, recorded every 3 sec, and the alarm printer record which shows status change events and prints out temperatures, pressures, and the time of the events. The timing of these four data recording systems was correlated and pertinent data were tabulated, analyzed, and plotted to show average containment temperature and pressure versus time. The data used have not been qualified and accuracy is not fully assured. Photographs and videotapes of the containment entries provided qualitative burn information. Hydrogen concentrations and burn damage are discussed. (7 refs.)

65640 Detonability of containment building atmospheres during core-meltdown accidents. R.Jaung, A.L.Berlad, W.T.Pratt (Dept. of Nuclear Energy, Brookhaven Nat. Lab., Upton, NY, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1171-7 vol.2
During core-meltdown accidents in light water reactors, significant quantities of combustible gases could be released to the containment building. The highest possible peak pressure fields that may occur through combustion processes are associated with detonation phenomena. Accordingly, it is necessary to understand and identify the possible ways in which detonations may or may not occur. Although no comprehensive theory of detonation is currently available, there are useful guidelines, which can be derived from current theoretical concepts and the body of experimental data. The authors examine these guidelines and indicate how they may be used to evaluate the possible occurrence of detonation-related combustion processes. In particular, this study identifies three features that an initiation source must achieve if it is to ultimately result in a stable detonation. One of these features requires post-shock initial conditions that lead to very short ignition delays. This concept is used to examine the possibility of achieving quasisteady detonation phenomena in nuclear reactor containment buildings during postulated core-melt accidents. (23 refs.)

65641 Hydrogen combustion in aqueous foams. M.R.Baer, S.K.Griffiths, J.E.Shepherd (Sandia Nat. Labs., Albuquerque, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1178-85 vol.2
Water fogs are recognized as an effective means to mitigate the effects of large-scale hydrogen combustion that might accompany some loss-of-coolant nuclear reactor accidents. Fogs of sufficiently high density to produce large beneficial effects may, however, be difficult to generate and maintain. An alternate method of suspending the desired mass of water is via high expansion-ratio aqueous foams. Because, in practice, the foam would be generated using the combustible gaseous contents of the containment vessel, combustion occurs inside the foam cells. Although foams generated with inert gas have been well studied for use in fire fighting, little is known about combustion in foams generated with flammable mixtures. To help assess the usefulness of aqueous foams in a mitigation plan, the authors have conducted several open tube tests and over one hundred closed vessel tests of hydrogen/air combustion with and without foam. (20 refs.)

65642 Hydrogen generation during molten-fuel-coolant mixing. M.Corradini (Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1186-94 vol.2
In the absence of adequate cooling water to the core of a light water reactor the fuel and cladding may melt. This molten material may mix with remaining water in the lower plenum or in the reactor cavity and generate hydrogen. A simple fuel-coolant mixing model is developed here to predict the minimum fuel diameter that can be attained during mixing. This result is used with other analyses to predict the rate of hydrogen generation when the fuel is molten. (23 refs.)

65643 Development and applications of a computer program for modelling the response to hydrogen burns in containment. M.J.Wester, S.E.Dingman, A.L.Camp, M.P.Sherman, P.G.Prassinos (Sandia Nat. Labs., Albuquerque, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1195-202 vol.2
Sandia National Laboratories is engaged in an NRC-sponsored program to study the problems associated with hydrogen generation in light water reactors. As part of that effort, the authors have developed a computer program called HECTR (hydrogen event: containment transient response), which models hydrogen burns in containments and the associated important heat transfer mechanisms. They summarize the capabilities of HECTR and present some calculational results. HECTR has been used to evaluate some hypothetical accidents for the Grand Gulf Mark III BWR. A number of cases were run with various compartment arrangements, burn times, etc. Other cases were run for comparison against the MARCH and CLASIX-3 codes. Qualitatively similar results were produced in most cases. Quantitative differences, in most cases, appear to be due to differences in the input assumptions and the heat transfer and burn models. (10 refs.)

65644 Combustion of hydrogen at high concentrations including the effect of obstacles. R.K.Kumar, H.Tamm, W.C.Harrison, G.Skeet, J.Swiddle (Whiteshell Nuclear Res. Establ., Atomic Energy of Canada Ltd., Pinawa, Manitoba, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1203-11 vol.2
Combustion of hydrogen-steam-air mixtures has been studied in a 2.3-m diameter sphere at 100°C and near atmospheric pressure. The range of concentrations investigated were 10% to 42% hydrogen and 0% to 30% steam by volume. Over this range, the combustion proceeded until one of the reactants was completely consumed. Measured peak combustion pressures were 10 to 20% below the calculated, adiabatic values. The effect of fan generated turbulence was less pronounced at high hydrogen concentrations than at low concentrations. The effect of obstacles was investigated by placing gratings in the sphere. Although gratings increased the extent of combustion and the peak pressure at low concentrations, their effect was less at high hydrogen concentrations. In general, gratings acted as heat sinks, reducing, in some cases, the peak pressure as well as the rate of pressure rise. These observations are preliminary and further studies are required for confirmation. (8 refs.)

65645 Hydrogen combustion results from the Sandia intermediate-scale (VGES) tank and the Sandia critical-tube-diameter test facility. J.C.Cummings, W.B.Benedick, P.G.Prassinos (Reactor Safety Studies Div., Sandia Nat. Labs., Albuquerque, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1212-18 vol.2
Sandia National Laboratories is currently involved in several experimental projects to provide data that will help quantify the threat of hydrogen combustion during LWR accidents. One project, which employs several experimental facilities, is the Variable Geometry Experimental System (VGES). The authors present descriptions of and experimental results from two of these facilities: an intermediate-scale burn tank (~5 m^3) and a critical-tube-diameter test facility. (5 refs.)

65646 A simplified hydrodynamic model of hydrogen flame propagation in reactor vessels. M.R.Baer, A.C.Ratzel (Sandia Nat. Labs., Albuquerque, NM, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1219-28 vol.2
A hydrodynamic model for hydrogen flame propagation in reactor geometries is presented. This model is consistent with the theory of slow combustion in which the gasdynamic field equations are treated in the limit of small Mach numbers. To the lowest order, pressure is spatially uniform. The flame is treated as a density and entropy discontinuity which propagates at prescribed burning velocities, corresponding to laminar or turbulent flames. Radiation cooling of the burned combustion gases and possible preheating of the unburned gases during propagation of the flame is included using a molecular gas-band thermal radiation model. (15 refs.)

65647 Design basis leak analyses for designing the sodium-water reaction products subsystem for the large developmental plant. N.Vasudevan, B.E.Bingham (Nuclear Power Generation Div., Babcock & Wilcox Co., Lynchburg, VA, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1231-6 vol.2

The sodium-water reaction products subsystem for an LMFBR is designed based on a spectrum of leaks that will cause sodium-water reaction in the steam generators. The authors describe the approach taken to design this subsystem for the Large Developmental Plant under contract to the US Department of Energy. Conclusions emphasize the need to perform parametric analyses to determine the worst leak location in the steam generator for the subsystem design. The use of design basis leaks to design the system is outlined, and the optimization of certain system parameters is discussed. (14 refs.)

65648 Thermalhydraulic characteristics in LMFBR hot plenum. N.Tanaka, S.Moriya, A.Wada (Central Res. Inst. of Electric Power Industry, Chiba, Japan).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1237-47 vol.2

The most important problem in the thermalhydraulic designs of the pool-type FBR is to estimate the thermal conditions affecting the vessel and/or internal structures during both steady and transient operations. The severity of these conditions in the Japanese pool-type reactor which will be reinforced and equipped with special devices for aseismic demands are apt to be much greater than other countries. Water tests and thermalhydraulic analyses have been performed to study such conditions. The main purpose of this study is to estimate the effects of the elevations of UIS (Upper Internal Structure) discharge and IHX (Intermediate Heat Exchanger) intakes of flow patterns, free surface disturbance and thermal-stratification in hot plenum. From the results of the experiments, suitable elevations could be recommended by comparing some thermalhydraulic characteristics. The calculations agreed well with the experimental results on the steady-state flow patterns and thermal-transients except the thermal-stratification. (8 refs.)

65649 Film boiling characteristics of liquid metals in the Leidenfrost phenomenon. K.Miyazaki, Y.Harada, N.Yamaoka, S.Inoue (Dept. of Nuclear Engng., Osaka Univ., Osaka, Japan), Y.Fujii-e.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1254-61 vol.2

In a steel container filled with 1.0 bar argon gas, potassium or sodium droplets were put on a heated plate and observed by a camera and a VTR through viewports. In the case of potassium, plates of 316-stainless steel and tantalum were used respectively for low and high temperatures and joule-heated by a DC power supply, while in the case of sodium, a tantalum disk was induction-heated by a 20 kHz and 30 kW power supply. Stable film boiling was observed for a high temperature of the plate or disk, whereas an instantaneous breakup of the droplet with extensive vaporization occurred for a low temperature. Whether or not a droplet did float on the plate was mainly governed by the interface temperature at the contact. The heat flux was estimated from the volumetric reducing rate of the droplet observed. For potassium, the results in the film boiling region showed an appreciably good agreement with prediction based on the Bromley's expression (1950) combined with the theory of Baumeister et al. (1966). For sodium, the experimental results were slightly higher than the prediction. (13 refs.)

65650 On the growth of large spherical sodium vapor bubbles in a liquid sodium pool. F.Casadei, M.D.Donne (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1262-73 vol.2

The study of the dynamics of the expansion of large bubbles of hot sodium vapor in a pool of liquid sodium plays an important role in understanding the effects of a HCDA. A model of the growth of the bubble in the pool is described. The equation of the motion of the liquid and the nonsteady heat diffusion problem are solved together with the continuity and energy equations for the vapor phase. The first set of calculations have been performed with constant evaporation and condensation coefficients. In the second, however, due account has been taken of the effect on the condensation of noncondensable fission gases and vapor convection. Due to the very high calculated vapor velocities, noncondensable gases have little effect on the condensation rate and the percentage amount of condensed sodium is considerably higher than previously calculated by other authors. (18 refs.)

65651 Synthesis of clad motion experiments interpretation: codes and validation. J.Papin, M.Fortunato (Centre d'Etudes Nucleaires de Cadarache, Saint Paul Lez Durance, France), J.-M.Seiler.

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1274-81 vol.2

Deals with clad melting and relocation phenomena related to LMFBR safety analysis of loss of flow accidents. The authors present the physical models developed at DSN/CEN Cadarache in single channel and bundle geometry, and the interpretation, with these models of experiments performed by the STT (CEN, Grenoble). It comes out that they have now obtained a good understanding of the involved phenomena in single channel geometry. On the other hand, further studies are necessary for a better knowledge of clad motion phenomena in bundle cases with conditions close to reactor ones. (5 refs.)

65652 Two-phase, two-component thermohydraulic conditions produced in the vent line of a steam generator following a sodium-water reaction. D.A.Greene (Advanced Reactor Systems Dept., General Electric Co., Sunnyvale, CA, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1282-92 vol.2

Presents techniques for calculating the thermohydraulic conditions in the vent line of a steam generator following a sodium-water reaction. The reaction produces copious quantities of hydrogen gas. This gas is vented into a collection tank through a duct. Depending upon the elapsed time from initiation of the reaction, the duct is filled with liquid sodium or liquid-sodium and hydrogen gas mixture. Equations were derived from first principles to describe the pressure gradients in the duct for a mixture of incompressible liquid and ideal gas under choked flow conditions. These equations were solved for liquid sodium and hydrogen gas using a computer. Solutions were obtained covering a broad range of parameter values and plotted to provide engineering design charts. These charts allow for a simple step-by-step calculation of the pressure gradients along the duct and the resulting pressures inside the steam generator. Several examples are developed to demonstrate methods of using the charts. Other design parameters, such as thrust from the fluid and vent line temperatures, are also calculated to complete the analysis of the venting system. (6 refs.)

65653 Thermal striping in liquid metal cooled fast breeder reactors. C.Betts, C.Boorman, N.Sheriff (Risley Nuclear Power Dev. Labs., UKAEA, Warrington, England).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1292-301 vol.2

Thermal striping is the random thermal cycling of a component by a flow stream resulting from the mixing of flow streams at different temperatures. In a liquid metal cooled fast breeder reactor it occurs in the above core plenum as a result of the mixing of coolant jets from core and breeder sub-assemblies. It is necessary to consider the temperature cycling in the context of fatigue of the striped component. The results of applying standard techniques are discussed and lead to the peak-to-peak temperature difference of the fluctuation as being important. The use of simulant fluids to examine the thermal-hydraulics of thermal striping is discussed and two models using air are described. Some characteristics of the peak-to-peak temperature variations obtained on these models are presented and compared with data obtained in sodium in PFR. (8 refs.)

65654 Boiling and dryout conditions in disturbed cluster geometry and their application to the LMFBR local fault assessment. K.Yamaguchi, H.Nakamura, K.Haga (O-arai Engng. Center, Power Reactor & Nuclear Fuel Dev. Corp., Ibaraki-ken, Japan).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1310-17 vol.2

The effect of a local cooling disturbance caused by an edge-type blockage in an LMFBR fuel subassembly was investigated with a series of out-of-pile local blockage experiments with water and sodium. The heat exchange layer model first developed for central-type blockage cases applied well to the present edge-type ones. An empirical formula was developed for estimating maximum temperatures in various subassemblies, and the conclusion was reached that a middle size edge-type blockage could lead to sodium boiling. The critical heat flux data of PNC and KfK were correlated with the boiling inception heat flux for various core flow velocities. A linear relation was found between them, suggesting a possible interpretation of the coolability limit within the frame of non-boiling conditions. The theoretical (hypothetical) excess temperature in the absence of boiling, ΔT_{ms} ($=T_{max}-T_{sat}$), seemed to cross a critical value at the instance of permanent dryout. Based on the constant critical ΔT_{ms} assumption and the formula for T_{max}, an assessment was made of the thermohydraulic consequences for the different blockage size situations of a typical LMFBR. (13 refs.)

65655 Fuel penetration of intersubassembly gaps in LMFBRs (a calculational method with the SIMMER-II code). G.P.DeVault (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1338-54 vol.2

Early fuel removal from the active core of a liquid-metal-cooled fast breeder reactor (LMFBR) undergoing a core-disruptive accident may reduce the potential for large energetics resulting from recriticalities. A possible avenue for early fuel removal in heterogeneous core LMFBRs is the failure of duct walls in disrupted driver subassemblies followed by fuel penetration into the gaps between blanket subassemblies. The SIMMER-II code was modified to simulate flow between subassembly gaps. Calculations with the modified SIMMER-II code indicate the capabilities of the method and the potential for fuel mass reduction in the active core. (3 refs.)

65656 Two-dimensional steady-state thermal and hydraulic analysis code for prediction of detailed temperature fields around distorted fuel pins in an LMFBR assembly: SPOTBOW. T.Shimizu (Nuclear Res. Lab., Nippon Atomic Industry Group Co. Ltd., Kanagawa-Ken, Japan).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1355-64 vol.2

The SPOTBOW computer program has been developed for predicting detailed temperature and turbulent flow velocity fields around distorted fuel pins in LMFBR fuel assemblies, in which pin-to-pin and pin-to-wrapper tube contacts may occur. The present study started from the requirement of reactor core designers to evaluate local hot spot temperatures due to the wire contact effect and the pin bowing effect on cladding temperature distribution. This code calculates for both unbaffled and wire-wrapped pin bundles. The Galerkin method and iterative procedure were used to solve the basic equations which govern the local heat and momentum transfer in turbulent fluid flow around the distorted pins. Comparisons have been made with cladding temperatures measured in normal and distorted pin bundle mockups to check the validity of this code. (12 refs.)

65657 Investigation of flow recirculation in a rod bundle during natural-convection flow and power transients. J.A.Fort, J.M.Bates, D.R.Rector, E.U.Khan (Pacific Northwest Lab., Richland, WA, USA).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1365-81 vol.2

An experimental investigation conducted at the Pacific Northwest Laboratory studied the flow recirculation phenomenon in a rod bundle during natural-convection flow and power transients. The experimental data were used to validate the recirculation model in the COBRA-WC computer program. The COBRA-WC code was then used to predict the flow and temperature fields in a prototypic Liquid Metal Fast Breeder Reactor (LMFBR) blanket assembly for a worst-case, natural-convection transient. (7 refs.)

65658 Heat transfer by natural convection in sodium from downward facing surfaces. D.Tenchine, M.Amblard (Service des Transferts Thermiques, CENG, Grenoble, France).

Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1412-17 vol.2

The safety analysis of pool type LMFBR might have to consider an eventual deposition of molten fuel on a core catcher plate. The present work deals with the heat exchange by natural convection in sodium from the downward facing surface of the core catcher plate. Analytical considerations are developed to determine the governing parameters and to define a realistic water model based on similarity criteria. It is shown that a liquid metal experiment with simplified boundary conditions is necessary to evaluate the uncertainty on the transposition from water mode data to the reactor. Main results from the water model and the sodium experiment are presented and compared with previous analytical and experimental data. An extrapolation from these results to the reactor case is proposed with an evaluation of the mean heat transfer correlation from the downward facing surface of the core catcher plate. (8 refs.)

65659 **BLOWAES: a method for evaluating blowdown two phase flowrate from pressure and thrust measurements.** F.D'Auria, P.Vigni (Dipartimento di Costruzioni Meccaniche e Nucleari, Univ. of Pisa, Pisa, Italy).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1469-76 vol.2
This work concerns the evaluation of various flow parameters during two-phase critical blowdown from a pressure vessel subsequently to a pipeline break. In particular BLOWAES (BLOWdown Analysis from Experimental Signals) allows one to obtain, from pressures and jet thrust measurements, the main blowdown related quantities like void fraction, quality and mixture velocity inside the pressure vessel and in the exit pipe. After a brief outline of difficulties currently encountered in two-phase critical flowrate evaluation, the basic program equations and the results of four applications are presented and discussed. (12 refs.)

65660 **Effects of cladding external thermocouples and electrical heater rod design on quench behavior.** R.C.Gottula, E.L.Tolman (EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1491-9 vol.2
Separate effects experiments were conducted on a bundle of nine electrical heater rods in the Loss-of-Fluid Test Support Facility at the Idaho National Engineering Laboratory. The objectives of these experiments were to evaluate the effect of cladding external thermocouples on the quench (cooling) behavior of a cartridge-type nuclear fuel rod simulator, to determine how accurately cladding external thermocouples measure cladding temperature during a high-pressure quench, and to compare the quench behavior of a cartridge-type heater rod (which simulates a fuel-pellet-cladding gap) with that of a solid-type heater rod (without a fuel-pellet-cladding gap) under thermal-hydraulic conditions that could occur during the blowdown phase (0 to 10 s) of a large break loss-of-coolant accident in a pressurized water reactor. (8 refs.)

65661 **Investigation of the effects of heater characteristics on post-CHF performance of a long vertical annulus in high pressure water.** A.Leung (Atomic Energy of Canada Ltd., Mississauga, Ontario, Canada), S.Banerjee, D.C.Groeneveld.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1500-5 vol.2
Post-CHF tests were performed in water on two identical annuli with 4.88 m heated length. The inner rod in one annulus was heated directly; the other was heated indirectly. The experiments were conducted at 9.7 MPa exit pressure over mass fluxes ranging from 2 to 5 $Mg.s^{-1}.m^{-2}$ and inlet qualities from −10 to −40%. The objective was to determine the effect of the type of heating on post-CHF heat transfer. The experimental results show that the maximum wall temperatures of the heaters were similar except at the highest mass flux tested at which the wall temperatures for the indirect heater were found to be lower. Also, circumferential spreading of the dry patch appeared to occur more readily for the indirect heater than for the direct heater, although the experimental evidence is by no means conclusive on this point. Finally, the spacers used to position the heater appeared to limit axial spreading of the dry patch. Qualitative explanations for these phenomena are discussed. (6 refs.)

65662 **Primary pump power as a measure of fluid density during bubbly two-phase flow.** G.E.McCreery, J.H.Linebargeer, J.E.Koske (EG&G Idaho Inc., Idaho Falls, ID, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1519-25 vol.2
A nuclear plant operator requires other information on reactor coolant system inventory besides just pressurize liquid level, which often disappears or gives ambiguous indications during a loss-of-coolant accident. Erroneous instrument readings during the Three Mile Island and Ginna accidents are examples. Pump power or current is shown to provide an additional source of inventory information. When the reactor coolant pumps are operating, it allows the operator to make decisions about the advisability of continued pump- and safety-injection operation. The inventory information is provided by a simple method of calculating fluid density for bubbly two-phase flow by relating pump power or current to fluid density. The calculational method is derived and compared with data. Calculations using the method agree well with the measured experimental data with increasing void fraction, until the flow transitions from bubbly to partially stratified churn flow within the pump. (11 refs.)

28.50 FISSION REACTOR TYPES AND APPLICATIONS

65663 **Further developments of high-temperature reactors in Japan, in the USSR and in other countries.** E.Balthesen (Bundesministeriums fur Forschung und Technol., Bonn, Germany).
VGB Kraftwerkstech. (German Ed.) (Germany), vol.62, no.12, p.1015-17 (Dec. 1982). In German.
The paper conducts a survey of the programme advanced partly independently and partly by the International Atomic Energy Agency in the 'Gas-Cooled Reactors' Working Group for the construction of high-temperature reactors in various countries. In this area international collaboration appears to be desirable for further development. At the present time no risk is seen that HTR technology is being developed only in the Federal Republic of Germany. (no refs.)

65664 **Electricity and process steam from a 500 MW high-temperature reactor.** E.Baust (Hochtemperatur-Reaktorbau GmbH, Mannheim, Germany).
VGB Kraftwerkstech. (German Ed.) (Germany), vol.62, no.12, p.1018-24 (Dec. 1982). In German.
Today all gas-cooled reactors together have operating periods which can be validly compared with those of pressurized and boiling water reactors. This positive balance and the recently observed trend towards smaller output capacities of 300 to 600 MW electrical output make the high-temperature reactor eminently suitable to meet this by virtue of its favourable technical and engineering safety characteristics. In this respect the Thorium High-Temperature Reactor (THTR) 300 will play an important part as a prototype and reference plant. (3 refs.)

28.52 FUSION REACTORS

(for confinement, see 52.55)

65665 Fusion reactor plasmas with polarized nuclei. R.M.Kulsrud, H.P.Furth, E.J.Valeo (Princeton Plasma Phys. Lab., Princeton, NJ, USA).
AIP Conf. Proc. (USA), no.95, p.637 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Summary form only given. Nuclear fusion rates can be enhanced or suppressed by polarization of the reacting nuclei. In a magnetic fusion reactor, the depolarized time is estimated to be longer than the reaction time. (no refs.)

65666 Irradiation creep in the fusion reactor first wall. W.A.Coghlan, L.K.Mansur (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Res Mech. (GB), vol.7, no.2, p.85-124 (1983).
Reviews experimental data and theoretical developments in the area of irradiation creep, with special emphasis on those aspects relevant to fusion reactor systems. The authors identify five irradiation conditions which are present in most fusion designs but are different from the conditions found in fission reactors: (1) large number of defects produced per primary knock-on atom (PKA), (2) high helium production rate, (3) cyclic operation, (4) unique stress histories, and (5) low-temperature operation. Theoretical considerations are used to deduce additional characteristics of irradiation creep in the fusion reactor for which no experimental data are available. (68 refs.)

65667 Ablative acceleration of pellet shells irradiated by external soft X-ray sources. T.Mochizuki, S.Sakabe, K.Okada, H.Shiraga, T.Yabe, C.Yamanaka (Inst. of Laser Engng., Osaka Univ., Suita, Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L133-5 (March 1983).
The first direct experimental measurement of soft X-ray driven ablation pressure has been done using a spherical pellet target and external soft X-ray sources. It has been found that the pressure is about 10 Mbar at an incident X-ray intensity I_x of 10^{13} W/cm^2 for glass and CH targets, and its intensity scaling is $I_x^{0.8}$. X-ray backlighted pellet images indicate that X-ray geometri-

cal smoothing at indirect irradiation is very effective for symmetrizing the implosion. (13 refs.)

65668 Dynamic HVEM observations of metals and alloys during in-situ helium ion irradiations. W.A.Jesser (Dept. of Materials Sci., Univ. of Virginia, Charlottesville, VA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1259-62 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A 200 kV ion accelerator, with a PIG source for accelerating ionized gases, was coupled to a 500 kV transmission electron microscope in order to investigate the effects of helium irradiation on the development of microstructure in candidate fusion reactor first wall material. The microstructural evolution in nickel and in type 316 stainless steel bombarded by 80 keV helium ions was monitored via video recordings. The effect of specimen thickness and temperature and the effect of plastic deformation during irradiation was considered. (22 refs.)

65669 Oxidation of tritium gas in glovebox atmosphere using CuO column. M.Nishikawa, T.Isayama, K.Shinnai (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.145-53 (Feb. 1983).
A multiple barrier containment concept for tritium control is proposed to provide minimal release to the environment. The rationale for this design is the prevention of the dilution of tritium within each barrier so that the tritium can be recovered before it penetrates to the outer barrier. The oxidation performances of a CuO sponge column in the inert atmosphere of a glovebox system are considered. The oxidation column efficiency is found to play an important role in the tritium level decrease on the glovebox atmosphere. (20 refs.)

65670 Neutronics design of tritium breeding blanket for fusion experimental reactor. S.Mori (Nuclear Systems Div., Kawasaki Heavy Industries Ltd., Tokyo, Japan), Y.Seki, H.Kawasaki.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.154-62 (Feb. 1983).
Detailed neutronics analysis of a Tokamak fusion experimental reactor was performed. The neutronics responses of components in the vacuum vessel of a swimming pool type reactor were calculated by Monte Carlo methods considering toroidal geometry, asymmetrical torus cross section, and neutron source distribution in plasma. It was found that the neutronics responses in the first wall and the blanket vary significantly in the poloidal direction. The effect of penetrations of neutral beam injectors on the tritium breeding performance was also evaluated in the analysis. The result shows that the effect is rather small in the present structure and it becomes clear that modifications of the blanket structure and material composition are needed to improve the tritium breeding performance and reduce the nuclear heating rate of the vacuum vessel in the divertor zone. (12 refs.)

65671 Surface irradiation damage of 316 stainless steel, vanadium and molybdenum by helium ion bombardment. H.Shinno, H.Shiraishi, T.Kimoto (Tsukuba Labs., Nat. Res. Inst. for Metals, Ibaraki, Japan), R.Watanabe.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.163-73 (Feb. 1983).
Molybdenum, V and 316 stainless steel were irradiated with 50~150 keV He ions at temperatures between 413 and 1298K for total doses ranging $1\times10^{22}\sim1\times10^{23}$ m^{-2}, and the characteristics of the surface damage were compared. Severe exfoliation was observed in all of these materials; the number of exfoliated skins was larger than that in literature, and increased nearly in proportion with the total dose. When the dose was low, the amount of erosion increased rapidly with total dose, but tended to be saturated for doses higher than 3×10^{22} m^{-2}. At temperatures over 923K, blisters and a porous surface were formed and the exfoliation of skins ceased. (24 refs.)

65672 Effect of particle recycling on burn control by compression-decompression. M.Ohnishi, A.Saiki, M.Okamoto (Inst. of Atomic Energy, Kyoto Univ., Kyoto, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.177-9 (Feb. 1983).
The authors study the effect of a finite particle confinement time on burn control by major radius compression-decompression, without the conservation of total fuel ions. The feedback control of fuel density in addition to the compression-decompression control to suppress thermal instability is also investigated. (5 refs.)

65673 Influence of preliminary neutron irradiation upon helium blistering in OKh16N15M3B steel. I.I.Chernov, B.A.Kalin, D.M.Skorov, G.N.Shishkin, M.V.Ivanov.
Sov. At. Energy (USA), vol.53, no.2, p.533-6 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.80-3 (Aug. 1982). [received: April 1983]
Experimental research on radiation-induced erosion of materials under bombardment has shown that the form of the surface destruction depends significantly upon the mobility of the induced gas atoms and vacancies and on the growth mechanism of gas bubbles. The first wall in a thermonuclear reactor is subjected to irradiation by neutrons, helium ions, and hydrogen isotopes. Previous investigations have shown that surface erosion in the first stage of reactor operation results mainly from helium blistering. Some researchers believe that in prolonged reactor operation, blister formation will be suppressed either by sputtering of the surface layer of the material before the critical dose of blister formation has been reached or by nonmonochromatic compositions of the ion beams. Yet, so far, the simultaneous influence of the various ions and the neutrons upon radiation-induced erosion has not been clarified. Experiments with successive and simultaneous irradiation by helium ions and hydrogen isotopes indicate that the simultaneous implantation of D^+ and He^+ ions reduces the critical dose and enhances surface erosion vis-a-vis irradiation by ions of a single type (D^+ or He^+). (16 refs.)

65674 Multigroup system of constants for calculating high-energy neutron transport. M.Yu.Vyrskii, A.A.Dubinin, A.I.Ilyushkin, V.E.Kolesov, A.S.Krivtsov, I.I.Longe, V.P.Mashkovich, V.K.Sakharov.
Sov. At. Energy (USA), vol.53, no.2, p.572-4 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.113-14 (Aug. 1982). [received: April 1983]
In order to calculate neutron transport in reactors and shielding, the system of constants in ARAMAKO-2F OBRAZ, ARAMAK-F and others, based mainly on the collection of group constants in BNAB-26 or on the later versions BNAB-70 and BNAB-78 are widely used. These systems satisfy the basic requirements of the constants necessary for designing the reactor and shielding. However, the insufficiently detailed resolution in the fast neutron energy range, use of the fission spectrum in obtaining the group cross sections, and absence of data on a number of processes that are important at neutron energies exceeding 10 MeV make it difficult to use the systems of constants indicated above for solving problems with high-energy neutron sources. The authors attempt to create a system of group constants for the fast-neutron energy range (E>0.8 MeV) with a sufficient number of groups. The criterion of sufficiency was the independence (with an error not exceeding 3%) of the group values of the total cross sections for interaction of neutrons from the shape of the intragroup spectrum. (12 refs.)

65675 Scaling of critical beta in a Tokamak. T.Tuda, M.Azumi, G.Kurita, T.Takizuka, T.Takeda.
Report JAERI-M-82-104, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Aug. 1982), 8 pp.
The stability of Tokamaks for high-n ballooning mode is studied. The combination of a 2-D transport code and an infinite-n ballooning code is used to optimize the beta value (the ratio of the plasma pressure to the magnetic pressure). (2 refs.)

65676 Computer-aided simulation model for hydrogen isotope separating column by cryogenic distillation. M.Kinoshita.
Report JAERI-M-82-108, Japan Atomic Energy Res. Inst., Tokai, Ibaraki, Japan (Aug. 1982), 45 pp.
This paper complements and extends the previously reported works by the same author on the mathematical simulation model for hydrogen isotope separating column by cryogenic distillation. The convergence features of the proposed mathematical simulation procedure are investigated in detail and several significant estimation methods for intitial values of a set of temperatures and phase flows are developed to ensure high efficiency of the iterative calculation as well as the achievement of convergence. Discussions are made on the effects of decay heat of tritium and nonideality of the hydrogen isotope solutions on steady state column performance. (16 refs.)

65677 Thermal instability analysis in a D-T tokamak reactor with density dynamics. A.Hatayama, M.Sugihara, T.Hirayama.
Report JAERI-M-82-147, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 28 pp.
Basic models and formulations, which take account of the effects of the density dynamics (e.g. density perturbation, particle recycling, convective energy loss, etc.) are developed for the thermal instability analysis in a D-T Tokamak reactor. The one-dimensional transport equations of ion density, electron and ion temperatures are linearized with respect to the perturbations and an eigenvalue analysis is used to calculate the growth rate of the instability. Critical curve of the stable and unstable regions on the density-temperature plane is determined for the case of the INTOR scaling law. It is also shown that the density mode of the trapped-ion scaling case is completely stabilized by the effect of particle recycling. They are reexamined by the time dependent transport code. These results show that the formulations developed are well effective to investigate the effects of the density dynamics on the thermal instability. (29 refs.)

65678 Surface materials considerations for fusion reactors. K.Sone, M.Maeno, S.Yamamoto, H.Ohtsuka, T.Abe.
Report JAERI-M-82-156, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 20 pp.
Surface materials considerations have been made to support the impurity control and first wall engineering task in the INTOR. They focus on low-Z material candidates including C (graphite), SiC and TiC. (38 refs.)

65679 Graphical representation of transmutation and decay chain data, transmutation cross section and delayed gamma ray emission data.
Report JAERI-1280, Japan Atomic Energy Res. Inst., Tokai, Ibaraki, Japan (Sept. 1982), 255 pp.
In a D-T burning fusion reactor, the neutron induced activity severely limits personnel access to the reactor. Accurate evaluation of the induced activity and dose rate is necessary to conduct effective biological shield design. In order to evaluate the dose rate accurately, considerable amount of activation data is required. This report gives a graphical representation of transmutation and decay chain data, transmutation cross section data and delayed gamma ray emission data for 116 nuclides of interest in terms of fusion reactor design. This graphical representation was made with hope of producing a reference for examining activation problems. It has already been shown to be effective in correcting inappropriate data. A computer code AMOEBA developed for the checking and plotting of the activation data is also described in this report. (24 refs.)

65680 Data on trapping and re-emission of energetic hydrogen isotopes and helium in materials. S.Yamaguchi, K.Ozawa, Y.Nakai, Y.Sugizaki.
Report JAERI-M-82-118, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Aug. 1982), 77 pp.
This report presents a compilation of the experimental data on trapping and re-emission of energetic hydrogen isotopes and helium in materials. A survey has been made of the literatures up to end of 1980, by dividing it into the following seven sections: (1) dose dependence, (2) target material dependence, (3) time dependence, (4) target temperature dependence, (5) incident energy dependence, (6) damage effects, (7) ion-induced release. The experimental data for helium, however, is cited only in limited cases, because of the lack of experiments. (76 refs.)

65681 Series lecture on advanced fusion reactors. J.M.Dawson.
Report IPPJ-623, Nagoya Univ., Japan (Jan. 1983), 69 pp.
The author presents a series of lectures on the concepts involved in advanced fusion reactors. (4 refs.)

65682 Particle simulation for magnetic fusion energy devices. V.K.Decyk (Center for Plasma Phys. & Fusion Engng., Univ. of California, Los Angeles, CA, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.89-91 vol.4
The importance and utility of particle simulation in modeling of magnetic fusion devices is illustrated by an example from RF plasma heating. Computer experiments are performed which examine the assumptions made by ray-tracing and transport codes. Wave propagation near the lower hybrid resonance was found to be in substantial disagreement with prevailing views. Among proposed damping mechanisms, absorption at moderate amplitudes was found to be a stochastic process, although gradient effects may be more important than previously considered. (14 refs.)

28.80 RADIATION TECHNOLOGY, INCLUDING SHIELDING

(see also 87.60 Medical and biomedical uses of fields, radiations and radioactivity)

65683 Liquid ionization chamber for absorbed dose determinations in photon and electron beams. K.-A.Johansson, H.Svensson (Dept. of Radiation Phys., Univ. of Gothenburg, Gothenburg, Sweden).
Acta Radiol. Oncol. Radiat. Therapy Phys. & Biol. (Sweden), vol.21, no.5, p.359-67 (1982).
The use of a liquid ionization chamber for measurements in electron and photon beams with energies above 1 MeV has been investigated. The liquid in the chamber is 2,2,4-trimethylpentane. Fundamental properties such as the reproducibility of the measured charge per absorbed dose, the temperature dependence, and the angular dependence have been experimentally analysed. The general recombination losses in pulsed beams are shown to be dependent on the transport time of the ions in the liquid. For a longer transport time than the time between two consecutive pulses the losses depend on the mean dose rate and for a shorter transport time the losses depend on the absorbed dose per pulse. The Jaffe method is used for determination of the initial recombination losses, and compared with results from other authors. (12 refs.)

65684 Radiological safety of accelerators. A comparison of performance standards. J.A.Devanney (Office of Radiological Health, Food & Drug Administration, Rockville, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1583-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The recommendation/requirements of the Suggested State Regulations are not out of line with those of the NCRP, IEC, or the proposed Canadian regulation. The 1982 Edition of the Suggested State Regulations, which reflect the philosophy of the NCRP, has the most stringent requirements for leakage radiation, both to the patient area and outside the patient area. The Canadian standard has the most stringent requirements for leakage radiation through the beam limiting devices. The IEC voluntary standard is less stringent than both the 1982 Edition of the Suggested State Regulations and the proposed Canadian regulation but is more stringent than the NCRP for leakage through the beam limiting devices. The NCRP has the least stringent requirement for leakage radiation through beam limiting devices, and at the present time does not address neutron leakage for accelerators. (11 refs.)

65685 Some specialized radiological safety considerations at Argonne National Laboratory's Heavy Ion Research Facility (SAR, shielding design, QFs, HIRC). R.H.Cooke, R.A.Wynveen (Occupational Health & Safety Div., Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1588-91 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
An existing accelerator system at Argonne National Laboratory (ANL) has been upgraded and is being extended to provide heavy ions with energies well above the nuclear binding energies (5-25 MeV/A). The final configuration of the system, called the Argonne Tandem-LINAC Accelerator System (ATLAS), is to become a user-oriented national facility for nuclear physics research. ATLAS will produce some specialized radiological safety considerations unique to this facility in addition to the safety considerations normally addressed at accelerators. (4 refs.)

65686 Radiation protection considerations of ion implantation systems. C.J.Maletskos, P.R.Hanley (VARIAN/Extrion Div., Gloucester, MA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1592-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Ion implanters produce beams of positive ions that impinge on target materials located in an enclosed vacuum system and are not intended to produce external beams or any other external ionizing radiation. The deceleration of positive ions produces negligible bremsstrahlung external to the implanters. The deceleration of electrons when striking beam-tube components produces bremsstrahlung resulting in significant quantities of unintended external radiation. These electrons are created by the interaction of positive ions with component parts of the implanter and with the residual gas and are subsequently accelerated in the implanter beam tube. At implanter ion energies ($<$500 keV), the bremsstrahlung is emitted in lobes essentially perpendicular to the electron stream (180° from the ion beam) modified by self-shielding from implanter structures. Experimentally, the radiation exposure rate is generally proportional to the electron current and to the square of the electron energy in essential agreement with theory. Implanter X-ray spectra are also in general agreement with spectra taken under laboratory conditions. Principles for reducing external radiation include the judicious combination of implanter design, materials with low atomic number for electrons to strike, cleanliness in assembly, use of suppression fields to reduce the number of electrons, shielding, interlocks, and operation. (5 refs.)

65687 Radiation safety systems at Brookhaven National Laboratory's low-energy accelerators. C.W.Flood,Jr. (Safety & Environmental Protection Div., Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1597-600 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Brookhaven National Laboratory has several low-energy accelerators in use at the present time. The author discusses the radiation safety systems installed at five of these accelerators. The accelerators included are a Dynamitron, 3.5 MeV Van de Graaff, 60″ Cyclotron, 41″ Cyclotron and Tandem Van de Graaff facility. All of these accelerators are capable of producing radiation levels in excess of 100 rem h and the radiation safety systems are designed to prevent personnel from being exposed to high levels of radiation. (no refs.)

65688 Measurement and analysis of gamma-ray dose distribution in actual ship. H.Yamakoshi, K.Ueki, M.Nakata (Ship Res. Inst., Tokyo, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.2, p.127-39 (Feb. 1983).
The gamma-ray dose distribution was measured in an actual ship to study the applicability of the point kernel method applied to the calculation of γ-ray dose distributions in ships. The measured distribution was used to verify the applicability of the Monte Carlo method. Monte Carlo analysis revealed that the γ-rays scattered back from the steel plates constructing the ship's hull increase their contribution to the measured dose value as the distance between the dose measuring point and the γ-ray source increases. It is also shown that the feasibility of applying Monte Carlo methods to the analysis of γ-ray dose distribution in ships will be enhanced remarkably by utilizing the function adopted in the subroutine RELCOL in the Monte Carlo code MORSE-CG and by applying the source direction biasing technique. (4 refs.)

65689 γ-radiation albedo of hydrogen-containing plane layers. V.I.Kulikov, K.K.Popkov.
Sov. At. Energy (USA), vol.53, no.2, p.553-4 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.102-3 (Aug. 1982). [received: April 1983]
The differential characteristics of the γ-radiation albedo of flat plates of various thicknesses made out of polyethylene, paraffin, Plexiglass, and layers of water are calculated with the help of the Monte Carlo method implemented in a previously published program. The statistical error of the calculations was 5-10% for the angular characteristics of the albedo and 5-30% for the spectroangular characteristics. (1 ref.)

65690 Fricke dosimetry in low dose range for food irradiation. T.Kume, H.Tachibana, M.Takehisa.
Report JAERI-M-82-100, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Aug. 1982), 20 pp.
In order to establish a suitable method of dosimetry in low dose range on food irradiation, the precision limit of the Fricke dosimeter (ferrous sulfate dosimeter) and the effect of water purification on Fricke dosimetry were investigated. At the dose range lower than 40 Gy, the errors of Fricke dosimetry are larger than 0.5% but does not exceed 2% at the dose as low as 15.5 Gy, whereas the errors are within 0.5% at more than 57.6 Gy. Among various kinds of water (tap-water, single distilled water, Milli-Q water and triply distilled water), Milli-Q water could be used for the Fricke dosimeter as good as triply distilled water. Milli-Q water is easily prepared in a short time from a Milli-Q system with the use of ion exchange cartridge and millipore filter. From these results, it has become apparent that Fricke dosimetry is applicable to low dose such as onion sprout inhibition (minimum dose 20 Gy). (8 refs.)

28.90 OTHER TOPICS IN NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

65691 Reactor engineering divison annual report. (April 1, 1981 - March 31, 1982).
Report JAERI-M-82-114, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Sept. 1982), 205 pp.
Research and development activities in the Division of Reactor Engineering in the fiscal year 1981 are described. The work of the Division is closely related to development of a multipurpose very high temperature gas cooled reactor and fusion reactors, and development of a liquid metal fast breeder reactor carried out by the Power Reactor and Nuclear Fuel Development Corporation. Contents of the report are achievements in fields such as nuclear data and group constants, theoretical methods and code development, integral experiment and analysis, shielding, reactor and nuclear instrumentation, reactor control and diagnosis, and fusion reactor technology, and activities of the Committee on Reactor Physics.

29.00 EXPERIMENTAL METHODS AND INSTRUMENTATION FOR ELEMENTARY-PARTICLE AND NUCLEAR PHYSICS

29.10 PREACCELERATION (INJECTION)

65692 A 550 MeV injector microtron for MAX. M.Eriksson (MAX-lab, Lund, Sweden).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.144-9 vol.1
An accelerator system called MAX is currently being built at the university in Lund. The accelerator system will be used both as a continous electron source for nuclear physics and as a synchrotron light source. The system will consist of an existing 100 MeV race-track microtron, which will be used as an injector, and a 550 MeV storage ring/pulse-stretcher, which just now is being built. (no refs.)

29.15 ELECTROSTATIC AND LINEAR PARTICLE ACCELERATORS

65693 Coming in close with Minac [nuclear power plant radiography]. A.H.Cordova (Electric Power Res. Inst., Palo Alto, CA, USA).
EPRI J. (USA), vol.8, no.2, p.18-19 (March 1983).
Describes a miniature linear accelerator which can perform X-ray inspections of thick-section components in the tightest quarters while the nuclear power plant is in operation. (no refs.)

65694 Impact of accelerators on US science, technology, and productivity. J.E.Leiss (Office of High Energy & Nuclear Phys., US Dept. of Energy, Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1353-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The invention and continued development of particle accelerators and the associated technology have had profound impact upon many subfields of pure and applied science and upon the overall US technological capabilities. Accelerators have also found extensive application in industry to produce either new products, better products, or products at lower cost. There is great potential for science to contribute to our long term economic growth and improved productivity through aggressive development of high-technology industries. Opportunities for application of accelerators in these high technology industries exist and should be exploited. This explotation would be aided by improved cooperative efforts between industry, universities, national laboratories, and government. (no refs.)

65695 University-industry research collaboration. Wei-Kan Chu (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1357-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Research and development efforts made by government, private industry and universities have transformed the United States into a major power in the world in science and technology. But our commitment in R&D has slipped in the past few years. There are growing problems in the composition of the science-engineering work force as well as our productivity. Possible long-term consequences of this worsening situation are predictable. Since government reduction in research spending plus inflation are eroding potential education and research funds, university-industry collaboration becomes a necessity for maintaining the research activities and to reverse the worsening trend. The necessity of collaboration is well recognized by industries as well as by academia. However, the implementation of university-industry collaboration is non-trivial. What universities want is research funding with freedom to spend it. What industries want is research results which can directly apply to the innovation of new and improved products and technology, plus a continuous flux of graduating young blood to inject into industries. The author emphasizes the crisis in R&D with cold statistics. He stresses the need of university-industry collaboration and summarizes and comments on some of the suggestions made to universities as well as to industries as examples in this type of collaboration. (no refs.)

65696 Initial operation of the Holifield facility. J.B.Ball (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1363-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The author reports on the present status of facility operation, observations from testing and running of the 25 MV Pelletron, experience with coupled operation of the Pelletron with the ORIC booster, and a brief summary of the experimental devices now available at the facility. (2 refs.)

65697 Quantitative radioisotope measurements with the NSF-Arizona regional accelerator facility. T.H.Zabel, A.J.T.Jull, D.J.Donahue, P.E.Damon (Univ. of Arizona, Tucson, AZ, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1371-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Results of tests on the tandem accelerator mass spectrometer (TAMS) at the University of Arizona are presented. These results demonstrate: (a) measurements of $^{14}C/^{13}C$ ratios with precisions of a few percent can be made in a period of one to several hours; (b) measurements with precisions of 0.5% have been made in which the uncertainties were mainly statistical and in which contributions to the uncertainty of machine fluctuations were negligible; (c) precise measurements of the ratio of $^{14}C/^{13}C$ in samples of NBS oxalic acid and of 1890 wood are consistent with the accepted value of that ratio; (d) the real signal from a 44000 year old sample is equal to the background rate produced from a dead carbon sample. In addition, results of some measurements on archaeological samples are presented. (4 refs.)

65698 Status of the VICKSI accelerator facility and its improvement by the addition of a tandem. P.Arndt, W.Busse, B.Martin, R.Michaelsen, W.Pelzer, D.Renner, B.Spellmeyer, K.Ziegler (Hahn-Meitner-Inst. for Kernforschung Berlin GmbH, Berlin, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1374-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A general description of the VICKSI accelerator facility is given including its experimental facilities. Its operation and its operational limits are explained as well as the improvements of VICKSI by the addition of an 8 MV tandem as alternate injector. The status and timetable for the tandem project is given. (11 refs.)

65699 Examples of fundamental research and applications at small accelerators. A.Ferle-Vidovic, S.Kaucic, T.Lechpammer, M.Osmak, D.Petrovic, D.Rendic, I.Slaus (Ruder Boskovic Inst., Zagreb, Yugoslavia).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1377-80 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Accelerators are facilities where fundamental research and applications develop jointly. The following are examples of an interplay between fundamental research and applications: 1. Evidence for the three body force (3BF) derived from neutron-neutron (n-n) scattering length data and nuclear data for science and technology. 2. Absence of nucleoside repair effects for neutron irradiation and the development of the neutron radiobiological facility. 3. Mathematical modeling and production of radiopharmaceuticals. (25 refs.)

65700 The Advanced Test Accelerator—a high-current induction LINAC. E.G.Cook, D.L.Birx, L.L.Reginato (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1381-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The Advanced Test Accelerator (ATA) is a linear induction accelerator being built at Lawrence Livermore National Laboratory. The aim of the ATA, together with its associated physics program, is the research and development necessary to resolve whether particle-beam propagation is possible. Since the accelerator is the tool needed to do the basic propagation experiment, many of its design parameters are specified by the physics. The accelerator parameters are: 50 meV, 10 kA, 70 ns pulse width (FWHM), and a 1 kHz rep-rate during a ten-pulse burst. In addition, beam quality and pulse-to-pulse repeatability must be excellent. The unique features of the accelerator are the 10 kA beam and the 1 kHz burst frequency. (9 refs.)

65701 PHERMEX standing-wave linear electron accelerator. T.P.Starke (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1402-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The PHERMEX standing-wave RF electron linac is a high-current pulsed electron beam generator that is used for flash X-radiography. This accelerator is being upgraded to 1000-A peak current and 50-MeV peak energy over a 150-ns pulse or over three 40-ns pulses. This upgrade is a result of increasing the RF power in the cavities and installing a new (Physics International) injector pulser. (3 refs.)

65702 A high-brightness negative hydrogen linear accelerator. E.A.Wadlinger, J.A.Farrell, H.O.Dogliani.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1408-11 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The authors have designed a linear accelerator to accelerate negative hydrogen ions to 50 MeV with an instantaneous output current of 100 mA and a normalized RMS emittance in both transverse planes of $0.02\cdot\pi$ cm.mrad. The design and results obtained to date with a 2-MeV prototype are presented. (11 refs.)

65703 Our development in small industrial accelerators. Zhou Qi Zhang (Accelerator Res. Inst., Shanghai Electrical Machinery Corp., Shanghai, China).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1412-14 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Accelerators used as a tool in industrial manufacturing processes are being developed successfully and rapidly. The author introduces the development in small accelerators used in the field of industries during the past 20 years. (no refs.)

65704 Low-energy, high-current proton accelerators at CRNL. M.S.de Jong, J.C.Brown, B.G.Chidley, L.D.Hansborough, R.M.Hutcheon, G.E.McMichael, S.O.Schriber, M.R.Shubaly, R.B.Turner, J.Ungrin (Chalk River Nuclear Labs., Res. Co., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1415-17 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
During development studies leading to operation of a 300 mA, 10 MeV proton linac in 1990 (the first stage of an accelerator breeder) several 100% duty cycle proton linacs will be built and tested to determine design limitations and operating characteristics. Presently a 750 kV injector and a 270 MHz drift-tube linac are being used to accelerate several mA of protons to 3 MeV in tests of high power operation. The first of the new linacs will be a 75 mA, 600 keV radiofrequency quadrupole structure. After initial operation an improved drift-tube linac will be added to accelerate the beam to 2.5 MeV. All of these 100% duty cycle proton linacs will have beams that could be used for radiation damage, beam diagnostic development, high-current beam-loss damage, beam dump design and transmission studies. The accelerator development program will be described as well as the possible practical uses for the proton beams. (12 refs.)

65705 A compact 6 MeV pulsed electron accelerator. R.M.Hutcheon, L.W.Funk, B.A.Gillies, S.B.Hodge, P.J.Metivier, S.O.Schriber (Chalk River Nuclear Labs., Res. Co., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1418-20 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A compact 6 MeV electron accelerator has been built and tested. The unit uses an axially coupled S-band standing wave structure driven by a magnetron source that delivers a 2 MW peak power, 4 μs pulse at 300 pps. The structure (including gun and high voltage feedthrough) is 12 cm diameter and 90 cm long. The gun is a novel telefocus design. The electron source is a 5.5 mm diameter loop of carburized thoriated tungsten wire in an electrode-focus coil geometry that produces a 40 keV input beam of ≤ 30 πmm mrad emittance at 25 mrad convergence half-angle. The gun is rugged, insensitive to mechanical shock, and requires only 7 watts of filament power to achieve 400 mA emission under operating pressures. the whole accelerator-gun package can be baked at 350°C, although a base pressure of 3×10^{-7} Pa is achieved with 24 hours of bakeout at only 150°C. At an output current of 100 mA (peak) in the pulse, the beam produces dose rates of more than 300 RMM on axis when using a 4 mm copper bremsstrahlung target. This roughly translates into a clinical flattened dose rate of 200 RMM over a 35×35 cm field. The accelerator package is straightforward to manufacture and could easily be reduced in length for specific applications. (6 refs.)

65706 Status of the 45 MeV proton LINAC at NEN. W.G.Mourad, R.F.Lankshear (New England Nuclear Corp., N Billerica, MA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1421-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Current status of the 45 MeV proton LINAC at NEN is described. Brief review of the major milestones is given. Operational experience with the injector, LEBT and other systems is reviewed. New systems that have been added over the past year are described and recent results are given. (8 refs.)

65707 Improved four-stage accel-decel production of low energy highly stripped heavy ions. P.Thieberger, J.Barrette, B.M.Johnson, K.W.Jones, M.Meron, H.E.Wegner (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1431-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The two model MP Tandem Van de Graaff accelerators at Brookhaven have been used in a four-stage accel-decel configuration to produce highly stripped

low energy heavy ions. The performance in this mode of operation has now been substantially improved by modifications of the second accelerator. The inclined field acceleration tube electrodes at the exit of this accelerator were replaced by straight electrodes, the vacuum was improved and the maximum negative thermal potential was increased. Higher intensity beams of heavier highly stripped ions can now be produced at lower energies than before. (5 refs.)

65708 Electron LINAC for laser and radiographic applications. W.E.Stein (Industrial Radiation Inc., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1434-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
New electron linear accelerator configurations have been designed and a few have been constructed to satisfy the needs of unique laser and radiographic applications. In the laser applications, electron linacs are required that produce exceptional electron beam quality. For adequate gain in the free-electron-laser experiments, 20-MeV electron beams with excellent emittance, low energy spread and high instantaneous current are essential. Similar beam quality from a 5-MeV linac is required to provide high efficiency and high repetition rate pumping of KrF or XeF gases in future excimer lasers. For radiography, new electron linacs with a variety of energies and intensities are required for special applications. Two diverse examples of custom linacs that have been requested and for which conceptual designs have been completed are: 1) a 10-MeV linac operating with an X-ray dose rate of 3000 R/min at 1 m while being subjected to extreme centrifugal and vibrational forces, 2) a light weight, highly portable 8-MeV linac with a dose rate of about 200 R/min at 1 m for X-ray and possibly neutron radiography in adverse environmental conditions at remote locations. (4 refs.)

65709 Low energy positron production at the Livermore LINAC. R.H.Howell, R.A.Alvarez (Lawrence Livermore Nat. Lab., Livermore, CA, USA), K.A.Woodle, S.Dhawan, P.O.Egan, V.W.Hughes, M.W.Ritter.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1438-41 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Beams of monoenergetic positrons with energies of a few eV to many keV have been used in experiments in atomic physics, solid state physics and materials science. The results of some of these experiments are given and the production of positron beams from a new source, an electron linac, is described. Intense, pulsed beams of low-energy beam from an electron linac. The production efficiency for low-energy positrons has been determined for electrons with energies from 50 to 120 MeV. Low-energy positron beams produced with a high energy electron a linac can be of much higher intensity than those beams produced with a high energy electron a linac can be of much higher intensity than those beams currently derived from radioactive sources. These higher intensity beams will make possible positron experiments previously infeasible. (12 refs.)

65710 A new type of charging belt for Van de Graaff accelerators. M.D.Strathman (Lawrence Berkeley Lab., Berkeley, CA, USA), E.Norbeck.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1502-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A Poly-C belt is installed on the AK-2000 accelerator at LBL which has been converted for use as an MeV electron source. Several anomalies are found when the belt was used to carry electrons rather than positive charge. Among these anomalies are: (1) the inability to maintain a given upcharge current for a fixed spray voltage, (2) a reduced charge carrying capability, and (3) a tendency to break into self-charge (>100 μA) when the spray voltage is raised to a large value and then reduced to zero. It is hypothesized that these anomalies, which occur when the belt is used to carry electrons, may contribute to the excellent characteristics of the Poly-C belt when it is used to carry positive charge. To alleviate these problems in the electron machine the spray supply is moved to the terminal and used to carry positive charge away from the terminal. When implemented in this fashion no problems are experienced with the belt. The Poly-C belt is an attractive replacement for the old HVEC belt. It exhibits better electrical stability and current carrying capacity, does not absorb moisture and should have a longer lifetime than the old style belts. (1 ref.)

65711 The Chalk River Electron Test Accelerator: a prototype for industrial irradiator designs. J.-P.Labrie, K.C.D.Chan, J.McKeown (Chalk River Nuclear Labs., Res. Co., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1634-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A CW electron linear accelerator is suggested as an efficient source of high power radiation for large scale material processing. Beams with a radiation equivalent greater than 5 MCi of ^{60}Co have been obtained with the Chalk River Electron Test Accelerator operating at 4 MeV and from simple scaling of the design concepts of the accelerator, radiation yields at least one order of magnitude higher can be confidently predicted. Research in window development is in progress. In a waste water treatment experiment, a 0.76 mm stainless steel window was used at a power dissipation of 1 W/mm^2 during a continuous 16 hour run without deterioration. In a separate facility, a 0.25 mm water cooled aluminum window designed to withstand 2 W/mm^2 is used to bring the electron beam into air. Results of electron beam distribution measurements in air are discussed. Recent technological developments both at Chalk River and at electron storage facilities using similar technology indicate that the CW electron linear accelerator will predominate in applications where beam powers greater than 200 kW are required. (12 refs.)

65712 Factors influencing the design of implanters for metal applications. P.H.Rose (Zymet Inc., Danvers, MA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1697-700 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The principal industrial use of accelerators at the present time is for implanting the silicon wafers used for making semiconductor devices. In the next few years the use of ion accelerators will extend to modifying the surface sensitive properties of other materials such as metals and ceramics. Exployment of an apparatus for a commercial usage makes the cost per operation the controlling parameter in machine design, and this in turn depends on the cost of the equipment, the throughput in units processed, and the reliability and quality of the product produced. The capital cost is only one of the factors to be considered. (8 refs.)

65713 Radio frequency characteristics of traveling wave accelerating sections calculated using a model resonator. V.F.Vikulov, V.E.Kalyuzhnyi.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1334-8 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2168-76 (Nov. 1982). [received: May 1983]
A model resonator for an accelerating section with a traveling wave is used to develop a technique for calculating the bandwidth (impedance) parameter of such sections and the field values and distribution over the cells in the sections for fixed generator power and cell parameters. Analytic expressions are derived for calculating the section cell parameters needed to produce a given field distribution at a specified frequency; analytic expressions are also derived for the optimal cell parameters in the wave type transformer and for the absorbing loads inside the waveguides to minimize reflections from the different sections within a frequency band. Practical recommendations are given for achieving these parameter values. (5 refs.)

65714 An accelerating section with a constant acceleration rate. A.I.Zykov, V.V.Kondratenko, G.D.Kramskoi, I.N.Mondrus, A.V.Ryabtsov, V.L.Smirnov, B.A.Terekhov, I.A.Chikatash.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1342-5 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2183-7 (Nov. 1982). [received: May 1983]
An accelerating section with varying cross section and $2\pi/3$ working oscillation phase has been designed, built, and tested. The experimental results at low powers in the acceleration mode are in satisfactory agreement with calculated results. (10 refs.)

65715 Improvement of the energy spectrum in standing wave accelerators by delaying injection. V.F.Vikulov, V.N.Zavorotylo, V.V.Ruzin, V.K.Shilov.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1345-7 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2188-91 (Nov. 1982). [received: May 1983]
Describes recent progress in the analytic and experimental study of injection pulse delay in terms of its effects on energy spread in the RELUS standing wave accelerator. The accelerators in the RELUS mode are designed to accelerate particles to 6 MeV at beam currents ≤ 100 mA per pulse; they are designed as a pair of high-Q accelerating sections in a biperiodic retarding system and are powered by a magneron across a 3-dB waveguide bridge. (6 refs.)

29.20 CYCLIC ACCELERATORS AND STORAGE FACILITIES

(for plasma accelerators, see 52.75)

65716 Elimination of resonances by Siberian snakes. E.D.Courant (Brookhaven Nat. Lab., Upton, NY, USA).
AIP Conf. Proc. (USA), no.95, p.388-93 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Polarised particles in a circular accelerator or storage ring undergo spin precession. On an ideal orbit in a 'flat' ring this leads to a spin precession frequency $\nu_p = \gamma G$ where G is the magnetic moment anomaly. There is a way to make the precession frequency essentially independent of energy instead of increasing with energy. This is the introduction of 'Siberian snakes'. A Siberian snake is a device, consisting of a sequence of horizontal and vertical deflecting magnets inserted into a straight section, which rotates the spin by 180 degrees about a horizontal axis. It causes the orbit to snake around; the magnets must be such that the net deflection of the orbit by the snake is zero. The author discusses the elimination of resonances by two types of snakes: Cobra and Sidewinder. (6 refs.)

65717 Report on 'The workshop on polarized electron acceleration'. G.-A.Voss (DESY, Hamburg, Germany).
AIP Conf. Proc. (USA), no.95, p.394-9 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The workshop on polarized electron acceleration and storage was sponsored by the 'International Committee for Symposia on High Energy Spin Physics' and took place at DESY in March of 1982. The purpose of the workshop was to reach a better understanding of the dynamics of spin polarization in large electron storage rings. In these machines natural polarization can develop as a consequence of an effect first described and analyzed by Sokolov and Ternov in 1963: The emission of photons by the accelerated electrons (synchrotron radiation) can be accompanied by a spin flip of the electron. The spin of

these particles can only be parallel or antiparallel to the magnetic guide field. Synchrotron radiation accompanied by a spin flip of the emitting electron favors the direction from the higher to the lower energetic state. (no refs.)

65718 Polarized beam at the AGS. L.G.Ratner (Brookhaven Nat. Lab., Associated Univ. Inc., Upton, NY, USA).
AIP Conf. Proc. (USA), no.95, p.412-18 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The AGS is designed to accelerate over 10^{10} polarised protons per pulse with a polarisation higher than 60% to an energy of 26 GeV. The author discusses the plans and status of the AGS polarised beam with reference to the following: polarised proton source; RFQ preaccelerator; low energy beam transport; polarimeters; resonance jumping devices; instrumentation and control. (7 refs.)

65719 Present status of polarized proton beam at KEK. S.Hiramatsu, D.Arakawa, S.Fukumoto, Z.Igarashi, K.Ikegami, T.Kato, J.Kishiro, T.Kawakubo, C.Kubota, Y.Mori, K.Muto, H.Sato, A.Takagi, E.Takasaki, T.Takenaka (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan), K.Imai, N.Tamura.
AIP Conf. Proc. (USA), no.95, p.419-23 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The project of acceleration of the polarized proton beam at 12 GeV proton synchrotron of KEK is now in progress. The construction of the new preaccelerator of 750 keV for the polarized H^- ion source and the new LEBT from the new preaccelerator to the linac started in 1980. The H^- injection system for the 500 MeV booster synchrotron is also under construction. The authors are also constructing now the polarimeters and pulsed quadrupole magnets and improving the control system of the orbit correction for the main synchrotron. The 20 MeV H^- ion beam accelerated by the linac is sent to the booster. In the booster H^- ion is converted to proton by the charge-exchange injection. During the acceleration in the booster, two depolarizing resonances, one intrinsic and one imperfection, have to be passed through. These two resonances will be passed through by spin-flip, so called adiabatic slow resonance passage. (4 refs.)

65720 Polarization at LEP. B.W.Montague (CERN, Geneva, Switzerland).
AIP Conf. Proc. (USA), no.95, p.424-9 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
With the increasing understanding of spin motion in e^+e^- storage rings over the last few years, prospects for obtaining polarized beams in LEP have improved. Although depolarizing resonances still present a major problem, some practical experience, together with recent theoretical advances, make their compensation appear more tractable than previously believed. By making relatively modest provisions in LEP it is hoped that transversely-polarized beams will be demonstrable at around 50 GeV during Phase I operation. In the higher energy range, where requirements become more stringent, the practicability of polarized beams is still uncertain. (9 refs.)

65721 HERA plans. K.Steffen (DESY, Hamburg, Germany).
AIP Conf. Proc. (USA), no.95, p.430-41 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
In the HERA ep collider, longitudinal electron polarization is required at collision. A pair of spin rotators turns the spin from its vertical orientation in the arc into the longitudinal at the interaction point and vice versa. Different types of spin rotators are reviewed, with corrections for off-energy operation, and spin matching conditions are discussed which the linear optics design must meet in order to avoid radiative depolarization. Results for a matched optics example are given. (10 refs.)

65722 Spin matching for polarized protons. A.W.Chao (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
AIP Conf. Proc. (USA), no.95, p.458-60 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Suggests a possible way to accelerate polarized protons. The basic data is borrowed from the works done on electron storage rings. The jargons involved are 'spin transparency' and 'spin matching', etc. In the proton language, the question being asked is what are the conditions on the accelerator lattice that make the depolarization resonance widths $\varepsilon=0$. Suppose one can 'spin match' the lattice so that at the moment of crossing a resonance during acceleration, the resonance being crossed is made to have zero width, then there will be no loss of polarization due to the resonance crossing. The author has listed the conditions for eliminating the widths of various depolarization resonances. These conditions are called the 'transparency conditions'. (9 refs.)

65723 Generalized Froissart-Stora formula. A.Turrin (Inst. de Fisica, Univ. di Roma, Roma, Italy).
AIP Conf. Proc. (USA), no.95, p.461-3 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
In a previous paper (1970) the author has developed an extension of the Froissart-Stora (1960) formula, which allows one to calculate the effect, on polarization, of the finite betatron tune-jump magnitude, ΔQ, in crossing rapidly an intrinsic depolarization resonance during acceleration in synchrotron. In that paper, the author has chosen a betatron tune-jump of the form $\dot{\chi}/\omega_0=-(\Delta Q/2)\tanh(\alpha t)$, which is symmetric in time, thereby excluding the conditions encountered in cases where the spread in Q, $G\Delta\gamma$, due to the γ spread, $\Delta\gamma$, of the beam is comparable with the applied range, ΔQ. So, it is to the analysis with replacement of the symmetric Q-jump above by an asymmetric one, namely $\dot{\chi}/_0=G(\bar{\gamma}-\gamma_{res})-(\Delta Q/2)\tanh(\alpha t)$, that the author has addressed the present work. Here, $\bar{\gamma}$ is the relativistic energy factor of any (selected) group of off-momentum particles having the same energy. (4 refs.)

65724 Studies of ion beam-photon interactions at the National Synchrotron Light Source. K.W.Jones, B.M.Johnson, J.B.Hastings, M.Meron (Brookhaven Nat. Lab., Upton, NY, USA), V.O.Kostroun, T.H.Kruse.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1026-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
To date, synchrotron radiation has been used for atomic physics experiments with gas or vapor targets. Experiments with crossed or merged ion and photon beams are made possible by the advent of high-brightness synchrotrons such as the National Synchrotron Light Source. Some types of experimental programs which can now be pursued are considered. Design parameters for a proposed ion-photon beam apparatus are discussed. (16 refs.)

65725 Research using synchrotron radiation at the National Synchrotron Light Source. W.Thomlinson (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1030-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The National Synchrotron Light Source (NSLS) is now becoming operational with synchrotron radiation experiments beginning on the 700 MeV VUV electron storage ring. Commissioning of the 2.5 GeV X-ray storage ring has also begun with the experimental program expected to begin in 1983. The current status of the experimental program and instrumentation, and the plans for future developments, are discussed. Although some early results have been obtained on VUV beam lines no attempt is made to describe them. Instead, an overview of the beam line characteristics is given, with an indication of those already operational. (18 refs.)

65726 The Texas A&M coupled-cyclotron system. B.Laune, D.May, D.H.Youngblood (Cyclotron Inst., Texas A&M Univ., College Station, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1367-70 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A superconducting cyclotron of the Michigan State University design having $K=500$ and $K_F=160$ is under construction at Texas A&M and will be used both alone and as a heavy-ion injector for the existing 224-cm cyclotron. The heavy-ion performance of the completed facility is compared with some other US facilities. Good intensity beams of lighter ions ($A<40$) above sonic velocity will be avaiable with beams above the Coulomb barrier available throughout the periodic table. Deuterons and alpha particles to 80 MeV/nucleon will be available from the cyclotron, while up to 55 MeV protons, up to 130 MeV ^{3}He ions and polarized protons, deuterons, and ^{3}He ions will remain available from the present cyclotron. (4 refs.)

65727 Progress on the NBS-LANL CW microtron. P.H.Debenham, S.Penner, R.L.Ayres, R.I.Cutler, E.R.Lindstrom, D.L.Mohr, J.E.Rose, M.A.D.Wilson (NBS, Washington, DC, USA), L.M.Young, R.E.Martin, A.Mitra, J.M.Potter, R.H.Stokes, P.J.Tallerico, L.Wilkerson.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1391-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The NBS-LANL racetrack microtron (RTM) currently under construction at the National Bureau of Standards is a demonstrated accelerator to determine the feasibility of, and to develop the technology necessary for building high-energy, high-current, continuous beam (CW) electron accelerators using beam recirculation through room temperature RF accelerating structures. Parameters of the RTM are: injection energy—5 MeV; energy gain per pass—12 MeV; number of passes—15 or 16; final beam energy—185-197 MeV; maximum current—550 μA; RF frequency—2380 MHz. At present, the electron gun and 100 keV beam transport line are operational, and most other major subsystems are in the construction or installation phase. Exceptions are the RF structure (under development), the 5 MeV beam transport line (in engineering design), and the extraction beam line (in conceptual design). (11 refs.)

65728 Betatrons with kiloampere beams. J.M.Peterson (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1396-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Although the magnetic-induction method of acceleration used in the betatron is inherently capable of accelerating intense particle beams to high energy, many beam-instability questions arise when beams in the kilo-ampere range are considered. The intense electromagnetic fields produced by the beam, and by the image currents and charges induced in the surrounding walls, can produce very disruptive effects. Several unstable modes of collective oscillation are possible; the suppression of any one of them usually involves energy spread for 'Landau damping' and careful design of the electrical character of the vacuum chamber. The various design criteria are often mutually incompatible. Space-charge detuning can be severe unless large beam apertures and high-energy injection are used. In order to have an acceptably low degree of space-charge detuning in the acceleration of a 10-kilo-ampere electron beam, for example, a1. injection energy on the order of 50 MeV seems necessary, in which case the forces due to nearby wall images can have a larger effect than the internal forces of the beam. (no refs.)

65729 JSW's BABY CYCLOTRON. Y.Toda, Y.Satoh, Y.Kaneda, I.Suzukawa, T.Yamada (Accelerator Group, Muroran Plant, Japan Steel Works Ltd., Muroran, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1405-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Designed by The Japan Steel Works Ltd., specially for installation in a hospital's medical department and nuclear research laboratory, 'JSW BABY CYCLOTRON' has been developed to produce short-lived radioisotopes such as ^{11}C, ^{13}N, ^{15}O and ^{18}F. JSW's Baby Cyclotron has some design features. 1) Fixed energy and four sector azimuthally varying field. 2) Compact figure desired for hospital's nuclear medical department. 3) A bitter type magnet yoke shielding activity. 4) Simple control and operation. 5) Easy maintenance without skilled personnel. (no refs.)

65730 Microprogrammable processor ESOP in a small angle elastic scattering experiment. R.Birsa, F.Bradamante, S.Dalla Torre, M.Giorgi, L.Lanceri, A.Martin, P.Moras, A.Penzo, P.Schiavon, A.Villari.
Report INFN/AE-82/10, Ist. Naz. Fis. Nucl., Trieste, Italy (1 Sept. 1982), 16 pp.
The microprogrammable processor ESOP has been introduced in the trigger system of a small angle elastic scattering experiment on a polarised proton beam at the Saturne synchrotron. The authors describe its implementation in a data acquisition system based on a Hewlett-Packard computer and present some preliminary results on the performance of a straight tracks rejecting algorithm. (9 refs.)

65731 Magnetic forces on the coils of the Superconducting Cyclotron at the University of Milan. E.Fabrici.
Report INFN/TC-82/10, Ist. Naz. Fis. Nucl., Milan, Italy (19 July 1982), 20 pp.
A three sectors cyclotron with superconducting coils is now under construction at the University of Milan. The machine covers a wide range of energies and ions, the maximum design energies being 100 MeV/n for fully stripped light ions and 20 MeV/n for the heaviest ones, corresponding to a K_{foc} equal to 200 MeV and K_b equal to 800 MeV respectively. The machine design and the expected performances are presented in detail. An important issue in designing superconducting coils for a cyclotron is to estimate with some accuracy the forces acting on them, in particular those arising from centering errors etc. These calculations are usually plagued by a number of uncertainties. Some effort has been made in order to narrow down the error limits, and this paper reports briefly on the results. They concern: the axial forces arising in an ideal situation, i.e. when the coils are perfectly centered with respect to the iron structure, and the axial and radial forces arising from errors in the coils positioning. (7 refs.)

65732 Use of electron rings in nuclear physics research. J.S.O'Connell (Center for Radiation Res., NBS, Washington, DC, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.1-3 vol.1
The author outlines how the developments in accelerators have improved our understanding of nuclear and elementary particle physics and speculates on how future advances in these fields will be linked. (no refs.)

65733 The MAX-project. B.Forkman (Dept. of Phys., Univ. of Lund, Lund, Sweden).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.47-51 vol.1
The accelerator system MAX consists of a 100 MeV injector race-track microtron and a 550 MeV pulse-stretcher/storage ring. As the accelerator system is designed in two planes, the injection microtron can be used for isotope production, radiography or, eventually, as an electron source for a free electron laser working in the IR region, while the ring is operated in its storage mode. For nuclear research experiments, a short (1 μs) microtron pulse will be injected from below into the ring. A slow extraction scheme will be used to get an almost continuous beam down to the lower plane where the nuclear research experiments will be carried out. In the storage mode, the ring will be filled with electrons which will be accelerated up to the maximum energy of 550 MeV. The upper plane will be used mainly for synchrotron light experiments. (1 ref.)

65734 Experience with a 150 MeV pulse stretcher ring SSTR. T.Tamae, O.Konno, M.Mutoh, K.Yoshida, T.Tanaka, T.Sasanuma, Y.Shibazaki, S.Urasawa, T.Terasawa, K.Yamada, T.Kurihara, T.Ichinohe, S.Takahashi, Y.Kawazoe, H.Miyase, M.Sugawara (Lab. of Nuclear Sci., Tohoku Univ., Sendai, Japan).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.52-9 vol.1
Operating experiences with a 150 MeV pulse stretcher ring is described. Since December 1981, test operation has been performed using a short beam pulse (20 nsec) to study the monochromatic beam extraction. Initially observed broadening of the extracted beam has been attributed to a coupled resonance between the horizontal and the vertical betatron oscillation. After readjusting the tune of the ring a 130 MeV, 1 μA electron beam has been obtained with 80% duty factor. The energy width of this extracted beam was measured to be 0.2%. (no refs.)

65735 ALS II: the Saclay proposal for a 2 GeV, CW electron facility. B.Aune, C.Grunberg, M.Jablonka, F.Koechlin, J.Magne, A.Mosnier, F.Netter (CENS, Gif-sur-Yvette, France).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.73-5 vol.1
Studies for the transformation of the ALS (600 MeV, 1% duty cycle) into a high energy, CW machine are currently being performed at Saclay. In order to use the greatest part of the existing facility, the solution of adding a stretcher ring to the linac (with new klystrons) has been chosen. (3 refs.)

65736 Storage rings with internal targets: design considerations. R.E.Pollock (Phys. Dept., Indiana Univ., Bloomington, IN, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.76-84 vol.1
The use of internal targets in stored beams of electrons or light ions offers many potentially attractive experimental advantages provided that the storage ring design accommodates this application properly. The experimenter typically demands: long, unencumbered straight sections with small, clean waists at the target position; access to reaction products emitted at small angles relative to the beam direction; variation in parameters to which the experiment may be sensitive such as dispersion and waist size; ready access to the ring interior for target changes, insertion of defining apertures; and so forth. On the other hand the ring designer seeks to minimize cost and complexity by: using repetitive lattice structures with high symmetry; avoiding the large chromaticity and other aberrations arising from tight waists in long straight sections; allowing little or no parameter variation; discouraging ring exposure to air to simplify the problem of maintaining a suitably high vacuum for a long beam lifetime, etc. (1 ref.)

65737 Remarks about a 'parasitic' 200 MeV electron ring. P.Carlos (CENS, Gif-sur-Yvette, France).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.137-43 vol.1 (1 ref.)

65738 Photonuclear research at the Bonn 500 MeV synchrotron. R.Stenz (Phys. Inst., Univ. Bonn, Bonn, Germany).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.209-18 vol.2
The performance of a tagged photon beam facility for the photon energy range 100 to 450 MeV is described. The first series of experiments has shown that the combination of a low background tagged photon beam and a large solid angle detector forms a valuable tool for the investigation of photonuclear processes. The accuracy of these experiments is still limited by technical problems. The next generation of electron accelerators will provide tagged photon beams with high energy resolution, reasonable intensity, and a precise normalization of the photon flux. This will remove the main obstacles preventing the exploitation of real photons as a clean probe. Future experiments will continue to explore the gross features of the photon nucleus interaction in the Δ-resonance region. The development of experimental techniques will concentrate on the identification of specific nuclear final states either by measuring the final nucleus in a track sensitive target or by detecting its low energy decay products. (15 refs.)

65739 The stretcher alternative: basic design considerations. B.Norum (Phys. Dept., Univ. of Virginia, Charlottesville, VA, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.265-74 vol.2
Design considerations for a pulse stretcher fall into two groups. The first are those determining the gross parameters of the system, that is the circumference, shape, and magnetic radius. The second group contains those which determine the optics of the machine, that is the tune, chromatic properties, extraction resonance, etc. The results of these two groups of considerations are strongly interrelated, but the factors which influence the former group are largely independent of those involved in the latter. It is generally safe, therefore, to consider them separately. (10 refs.)

29.25 PARTICLE SOURCES AND TARGETS, PREPARATION AND TECHNOLOGY

(see also 07.77 Particle production and handling; targets)

65740 The acceleration of polarized protons. R.D.Ruth (Lawrence Berkeley Lab., Berkeley, CA, USA).
AIP Conf. Proc. (USA), no.95, p.378-87 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Introduces the problems of accelerating polarized protons (or other ions) to high energy. The author discusses a quantum mechanical style perturbation theory which is used for calculating the depolarisation due to passage through a resonance. He also considers the effects of overlapping resonances. (7 refs.)

65741 Beam polarization at PETRA. H.D.Bremer, K.Kewisch, H.C.Lewin, H.Mais, G.Ripken, R.Rossmanith, R.Schmidt (DESY, Hamburg, Germany), D.P.Barber.
AIP Conf. Proc. (USA), no.95, p.400-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The results of the polarization measurements at PETRA are described: the natural small degree of polarization in PETRA has been increased to up to 80 percent in a single beam by a special orbit correction program. Measurements have also shown that a strong beam-beam interaction can depolarize the beam and at 16.5 GeV the luminosity for polarized beams in a given optics is limited to approximately 4×10^{30} cm^{-2} sec^{-1}. In addition the first measurements of the depolarization by solenoids and the first calibration of the beam energy at PETRA by a depolarizer are described. (5 refs.)

65742 Crossing of depolarization resonances at Saturne (Saclay). E.Grorud, J.-L.Laclare, G.Leleux, A.Nakach, A.Ropert (Lab. Nat. Saturne, Saclay, France).
AIP Conf. Proc. (USA), no.95, p.407-11 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Presents the results of the 1981-1982 campaign of polarization measurements at Saturne. Resonance crossing techniques are given for each other of resonance. The adiabatic crossing of a resonance (spin flip) is proved to be reliable. (3 refs.)

65743 Polarized proton and antiproton beams and experiments at the Tevatron. A.L.Read (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
AIP Conf. Proc. (USA), no.95, p.442-4 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Describes a 200 GeV polarized proton (and antiproton) beam and experimental facility which will be built as part of the Tevatron II construction program at Fermilab. The beam is being developed by a joint Argonne-Fermilab team. The detector facility for the first experiments using the polarized beam is the responsibility of an Annecy-Argonne-Berkeley-Fermilab-Kyoto-Northwestern-Rice-Saclay-Serpukhov-Trieste collaboration. (no refs.)

65744 Acceleration of polarized deuterons at the synchrophasotron from the source 'POLARIS'. N.G.Anishchenko, A.M.Baldin, Yu.D.Beznogikh, V.P.Ershow, V.V.Fimushkin, V.A.Monchinsky, Yu.K.Pilipenko, Yu.I.Romanov, I.N.Semenyushkin, V.B.Shutov, A.Sulik, A.I.Valevich, L.P.Zinoviev (High Energy Lab., JINR, Dubna, USSR).
AIP Conf. Proc. (USA), no.95, p.455-9 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
A cryogenic source of polarized deuterons POLARIS has been tested at the Dubna synchrophasotron for the program of research in the field of relativistic nuclear physics. The aim of the tests is to match the source with linac and

to accelerate a beam of deuterons. The set-up is described, and results of its operation along with the accelerator are presented. (3 refs.)

65745 **Polarization precession in quadrupoles and sextupoles.** D.Carey (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
AIP Conf. Proc. (USA), no.95, p.454-7 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Lie algebraic techniques are applied to the precession of polarization in a magnetic field. The rotation matrix is represented as the exponential of an antisymmetric matrix. The equation of motion is derived as a series of commutators. The lowest order approximation gives the rotation in terms of the integral of the magnetic field along the particle trajectory. Higher-order terms yield rotations about the longitudinal axis. Explicit expressions are given for quadrupole and sextupoles. (no refs.)

65746 **Polarised targets—what is happening.** G.R.Court (Dept. of Phys., Univ. of Liverpool, Liverpool, England).
AIP Conf. Proc. (USA), no.95, p.464-72 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Reviews the current situation as regards polarised targets for use in external particle beams, from the point of view of the user—the high energy physicist. (11 refs.)

65747 **Dynamic polarization in some high-hydrogen glasses.** D.Hill (Argonne Nat. Lab., Argonne, IL, USA), M.Krumpolc.
AIP Conf. Proc. (USA), no.95, p.479-84 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Reports on a search for hydrogen-rich glasses suitable for forming solid solutions of Cr(V) complexes. The author discusses the existence of two large 'families' of glasses based on amines and ammonia obtainable with either borane-amine complexes or ammonium borohydride as 'vitrifying additives'. The glasses have hydrogen contents ranging up to at least 21 wt.%. Moreover, at least some members of these families yield sizeable dynamic nuclear polarizations when doped with sodium bis[2-ethyl-2-hydroxybutyrato(2-)]oxochromate(V) monohydrate, [EHBA-Cr(V)]. (1 ref.)

65748 **A frozen spin polarized proton target for use at LAMPF.** D.Hill, T.Kasprzyk, H.Spinka, S.Zelipsky (Argonne Nat. Lab., Argonne, IL, USA), J.J.Jarmer, J.Vaninetti.
AIP Conf. Proc. (USA), no.95, p.485-7 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
A frozen spin polarized proton target has been developed and used at LAMPF to measure the spin correlation parameter A_{SS} for proton-proton elastic scattering. The target consisted of a horizontal dilution refrigerator, superconducting magnet, plus other equipment. The target refrigerator was fixed and the magnet moved on a rail system. The design permitted the same magnet to be used for both the polarizing and holding functions. In the holding configuration the magnetic field at the target was about 3 kG, and the open angular region for detecting scattered particles was 0° to 90° lab. With ethylene glycol target material a typical holding time of 500 hr was observed. (3 refs.)

65749 **Polarization measurements on irradiated ammonia.** P.R.Cameron, D.G.Crabb, S.L.Linn (Univ. of Michigan, Ann Arbor, MI, USA).
AIP Conf. Proc. (USA), no.95, p.488-91 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The polarization characteristics of ammonia irradiated at liquid helium temperatures and subsequently used in a scattering experiment are discussed. (4 refs.)

65750 **Horizontal dilution refrigerator for use in intense proton beams.** J.A.Bywater (Argonne Nat. Lab., Argonne, IL, USA), P.R.Cameron, D.G.Crabb.
AIP Conf. Proc. (USA), no.95, p.492-5 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
A fast loading high-power horizontal dilution refrigerator insert has been built for use in the Michigan polarized proton target (PPT V). This PPT will be used in measurements of spin effects in high $P_\perp$ elastic p-p scattering at the Brookhaven AGS. The cooling power is compared with the existing interchangeable ^{3}He evaporation insert, and with similar dilution refrigerators at CERN and Bonn. The relative merits of these two types of refrigerators in absorbing the heat loads of high intensity beams is discussed. (11 refs.)

65751 **A frozen spin target with three orthogonal polarization directions.** R.Bernard, P.Chaumette, J.Deregel, R.Duthil, J.Fabre, C.Lesmond, G.Seite (CEN-Saclay, Gif-sur-Yvette, France), T.Niinikoski, J.M.Rieubland, J.Ball, P.Chesny.
AIP Conf. Proc. (USA), no.95, p.496-8 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
A frozen spin target has been constructed at CEN-Saclay for nucleon-nucleon scattering experiments at the PS SATURNE II. The target which may have a maximum volume of 100 cm^3 is cooled in a vertical dilution refrigerator. The magnetic system is entirely superconducting and allows the polarization vector to be oriented in three orthogonal directions This target has been already used for the measurements of several parameters in the p-p scattering. (8 refs.)

65752 **A double target cell cryostat with quick interchange of target cells.** J.J.Jarmer, J.Vaninetti (Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.95, p.499-501 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
A polarized target incorporating two target cells has been built and used in an experiment at LAMPF. Under cryogenic conditions either cell would be positioned on beam line in a few minutes permitting fairly rapid change over from one to the other. (1 ref.)

65753 **Ammonium borohydride—a novel, hydrogen-rich material for polarized targets.** M.Krumpolc (Univ. of Illinois, Chicago, IL, USA).
AIP Conf. Proc. (USA), no.95, p.502-4 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Preparation and properties of a novel, hydrogen-rich material, ammonium borohydride, NH_4BH_4 (24.5% H) are described. An ammonia solution of the hydride can be doped with the chromium(V) complexes and used for the preparation of polarized targets. (3 refs.)

65754 **Irradiated NH_3 and ND_2—two new target materials for polarized targets.** W.Meyer (Phys. Inst., Univ. Bonn, Bonn, Germany).
AIP Conf. Proc. (USA), no.95, p.505-11 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
A study of dynamic nuclear polarization (DNP) in NH_3 and ND_3 was made at the Bonn 2.5 GeV electron synchrotron. The paramagnetic radicals in the polycrystalline ammonia beads were created by irradiation in the high intensity 20 MeV electron beam ($>10^{14}$ electrons/sec) of the injection linac. During irradiation the ammonia beads, produced by dropping into liquid nitrogen, were cooled in liquid argon at ~90K. DNP measurements were performed at 1K, 0.5K and 0.2K in a 2.5 T magnetic field. Samples of NH_3, prepared in this way, yielded a maximum proton polarization of 66% at a temperature of 0.5K with a short polarization build-up time of 9 minutes. ND_3 could be polarized at a temperature of 0.2K up to 31%. The radiation resistance of the polarization of NH_3 is better than that of butanol. (23 refs.)

65755 **Present status of spin frozen deuteron target at KEK.** S.Hiramatsu, S.Isagawa, S.Ishimoto, A.Masaike, K.Morimoto (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
AIP Conf. Proc. (USA), no.95, p.512-14 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Brief report on the present status of a spin frozen deuteron target at KEK is presented. Deuterons in fully deuterated propanediol (D-8) with EHBA-Cr^V complex were polarized up to 40% in a high cooling power dilution refrigerator which was installed in a large aperture spectrometer. (4 refs.)

65756 **The ITEP polarized target installation for the study of interactions between hadrons and polarized protons at intermediate energies.** M.I.Bloodnishev, P.E.Budkovskii, V.M.Dobroc, V.P.Kanavets, I.I.Levintov, I.P.Marevichev, V.I.Martynov, B.V.Morozov, V.M.Nesterov, V.V.Rylstov, A.D.Sulimov, T.S.Cherkalina, A.V.Soskov, V.L.Hohlov (ITEP, Moscow, USSR).
AIP Conf. Proc. (USA), no.95, p.515-16 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The installation is designed for research of interactions between hadrons and polarized protons. It contains an ethylene glycol polarized target, a system of wire-spark detectors connected on-line with an EC-1010 computer, a system of scintillation and threshold Cherenkov counters for secondary particle separation. The spectrometric abilities of the installation are provided by the magnet of the polarized target with spark chambers in its field. Now it is located in a beam of the ITEP accelerator with particle momenta up to 2 GeV/c and is used for research of polarization in elastic pion-proton scattering. (no refs.)

65757 **Polarisation properties of irradiated ammonia (NH_3 and ND_3) at 1K and 25 kG.** H.Riechert (Phys. Inst., Univ. Bonn, Bonn, Germany).
AIP Conf. Proc. (USA), no.95, p.520-5 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Dynamic Nuclear Polarisation (DNP) of irradiated ammonia was examined in some detail at 1K and 25 kG. In continuation of earlier studies conducted in Bonn, it was attempted to gain information about the prevailing mechanism of DNP in this material. Therefore the frequency dependence of DNP in NH_3, of deuterons and unsubstituted protons in ND_3, as well as the polarising time τ and the relaxation time T_1 in NH_3 were measured. Also the shape of the deuteron polarisation signal observed in ND_3 is discussed. The polarisation measurements in ND_3 rule out the equal spin temperature (EST) behaviour of proton and deuteron DNP that is observed in most of the currently used target materials. It is attempted to explain the observations with a differential solid state effect model. Results of calculations for NH_3 and ND_3 incorporating the measured EPR-spectra are presented. (7 refs.)

65758 **Dynamic nuclear polarization of irradiated targets.** M.L.Seely, A.Amittay, M.R.Bergstrom, S.K.Dhawan, V.W.Hughes, R.F.Oppenheim, K.P.Schuller, P.A.Souder (Yale Univ., New Haven, CT, USA), K.Kondon, S.Miyashita, K.Morimoto, S.J.St. Lorant, Y.-N.Guo, A.Winnacker.
AIP Conf. Proc. (USA), no.95, p.526-33 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors have irradiated and studied dynamic nuclear polarization in ammonia, deuterated ammonia, butanol, borane ammonia, methylamine, ethane and lithium borohydride in order to test these substances for potential use as polarized target materials. These studies were conducted using a polarized target system operating at a temperature of 1K and a magnetic field of 5 T. The target system was set up on a beam line at the Stanford Linear Accelerator Center, enabling us to irradiate the targets in situ at 1K with a 6 to 20 GeV electron beam and to study their polarization properties simultaneously. Proton polarisations of ~70% and deuteron polarizations of ~25% were obtained in irradiated NH_3 and ND_3, with relatively short values of the polarizations growth time T_p. For both of these materials, the radiation resistance of the polarization was found to be approximately 30 times greater than for conventional chemically doped hydrocarbon targets. In the remaining irradiated materials tested, relatively small proton polarizations (~30% or less) were obtained and these materials do not seem to be suitable for polarized target applications. Irradiated NH_3 and ND_3, however, are very promising as practical polarized target materials. (7 refs.)

65759 **Workshop report on polarized proton ion sources.** V.W.Hughes (Yale Univ., New Haven, CT, USA).
AIP Conf. Proc. (USA), no.95, p.534-45 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The author presents a report on the developments in polarised proton ion sources. Current techniques in the production of polarised ion sources are reviewed with emphasis on the need to improve the quality of the sources. (25 refs.)

65760 **Spin-polarized hydrogen: new possibilities for polarized sources and targets.** D.Kleppner, T.J.Greytak (Dept. of Phys., MIT, Cambridge, MA, USA).
AIP Conf. Proc. (USA), no.95, p.546-65 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The creation of spin-polarized atomic hydrogen ($H\downarrow$) points the way to improved methods for producing polarized proton sources and targets. The systematics of $H\downarrow$ are reviewed and applications are outlined for an intense H^- source, a polarized atomic jet, and gaseous and solid targets. A technique is proposed for producing solid polarized deuterium for use in a fusion reactor plasma or as a polarized target. (24 refs.)

65761 **Solid state polarized electron sources.** M.Campagna, S.F.Alvarado (Inst. for Solid State Phys., KFA, Julich GmbH, Julich, Germany), F.Ciccacci.
AIP Conf. Proc. (USA), no.95, p.566-73 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The author reviews the progress achieved in our laboratory towards the further development of a nonmagnetic, solid state polarized electron source. Alloys of $Al_xGa_{1-x}As$ grown by molecular beam-epitaxy are shown to allow room temperature operation and generate polarized electrons by optical pumping at convenient wavelengths with polarization values in the range $P=45\%\pm1\%$. The performance of multilayers of GaAs-$Al_xGa_{1-x}As$ as photoemitters is also briefly described. Surface passivation of $Al_xGa_{1-x}As$ epitaxial layers is shown to be an efficient way for protecting the cathodes during exposure to atmosphere and allowing subsequent regeneration of the source parameters after ultrahighvacuum annealing. Ideas for further increasing the spin polarization P beyond the theoretical limit of 50%, valid for GaAs, are also discussed. (15 refs.)

65762 Polarized electron source for parity experiment at Bates. P.Souder (Yale Univ., New Haven, CT, USA), A.Barber, W.Bertozzi, G.Cates, G.Dodson, T.J.Gay, M.Goodman, V.W.Hughes, S.Kowalski, M.S.Lubell, A.Magnon, C.P.Sargent, R.Schaefer, W.Turchinetz, R.Wilson.
AIP Conf. Proc. (USA), no.95, p.574-9 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors are constructing a polarized electron source in order to study parity violation in elastic electron-carbon scattering at the MIT Bates Linac. The source uses a GaAs photocathode illuminated by light from an infrared krypton ion laser. Our design, which uses a multi-chamber vacuum system, meets the special requirements for operation at Bates. (12 refs.)

65763 A source of polarized electrons for a neutral current parity experiment. E.Reichert (Inst. for Phys., Univ. of Mainz, Mainz, Germany).
AIP Conf. Proc. (USA), no.95, p.580-5 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The author presents experimental details of polarised electron experiments at SLAC. The author describes the GaAs photocathode used and its operating characteristics. (5 refs.)

65764 Polarized photons for a measurement of parity violation in deuterium. A.B.McDonald, E.D.Earle, E.T.H.Clifford (Chalk River Nuclear Lab., Chalk River, Ontario, Canada).
AIP Conf. Proc. (USA), no.95, p.485-93 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors provide a general outline of the parity violation experiment and describe the development of the source of circularly polarized bremstrahlung. (14 refs.)

65765 A spin flipper for thermal atomic beams. G.Baum, W.Schrodger (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany).
AIP Conf. Proc. (USA), no.95, p.594-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The spin flipper presented here is based on the method of a diabatic passage. It allows for a rapid reversal of electronic as well as nuclear polarization of a thermal atomic beam without affecting beam intensity, beam profile, or magnetic fields in the interaction region. The flipper will be used in spin dependent measurements where industrial asymmetries and systematic errors have to be kept small. The spin flipper was tested with a polarized lithium beam in an atomic physics experiment and the reversal efficiency was found to be 0.98. The flipper can easily be adapted for other spin-polarizable atoms, e.g. for a polarized atomic hydrogen beam target. (5 refs.)

65766 Progress on producing polarized negative hydrogen ions by the ETHZ polarized ion source using the atomic beam method. P.A.Schmelzbach, W.Gruebler (Lab. fur Kernphys., Eidgenossische Tech. Hochschule, Zurich, Switzerland).
AIP Conf. Proc. (USA), no.95, p.604-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The progress on the ETHZ polarized negative hydrogen ion source, based on the atomic beam method, is described. Particular improvements have been made in the double charge exchange from positive to negative hydrogen ions. At present the source produces over 100 μA H^+ ions, which yields 5-6 μA polarized negative hydrogen ions. These ions have been accelerated in an EN tandem accelerator. A record current of 2-3 μA of polarized deuterons with 89% polarization could be focused through a 3 mm diameter collimator on a target. Further improvements incorporating presently available techniques are discussed. It is shown that 50-100 μA of polarized H^- and D^- ions can be produced with this type of source. (4 refs.)

65767 Status of the AGS polarized H^- source. A.Kponou, K.P.Schuler, V.W.Hughes (Yale Univ., New Haven, CT, USA).
AIP Conf. Proc. (USA), no.95, p.607-10 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Development of a polarized H^- source for the AGS polarized proton project, initially begun at Argonne National Laboratory in 1979, has been continuing at Brookhaven National Laboratory since early 1982. A description of the source is given and the status of the project is reviewed. (10 refs.)

65768 Recent development of optical pumping type polarized ion source at KEK. Y.Mori, K.Ikegami, A.Takagi, S.Fukumoto (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
AIP Conf. Proc. (USA), no.95, p.611-14 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors have constructed an ECR (electron cyclotron resonance) ion source to examine the characteristics and performance of the ECR ion source. It was found that this source was very suitable for an optical pumping type polarized ion source. They are now developing an optical pumping type polarized ion source. They are now developing a 16.5 GHz ECR ion source and constructing a new optical pumping type polarized ion source using this ECR ion source. In a preliminary experiment, they have already obtained the polarized H^- ion beam of 20~25 μA. (12 refs.)

65769 Improved Cs^0 source for the production of polarized H^- ions. T.Wise, W.Haeberli (Univ. of Wisconsin, Madison, WI, USA).
AIP Conf. Proc. (USA), no.95, p.615-17 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
The authors describe the production of a 3 μA DC beam of polarized H^- by ionization of polarized H^0 atoms with a 3 particle-mA Cs^0 beam of 40 keV energy. An improved Cs gun is described which yields 10 particle-mA Cs^0. (1 ref.)

65770 Counting a small number of radioactive atoms Monte Carlo program. K.T.Ekholm, A.M.Aurela (Wihuri Phys. Lab., Univ. of Turku, Turku, Finland).
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.163-70 (April 1983).
The authors determine the posterior probability P_i that the rate of the production of specific radioactive atoms $R_i(i=1,...,N_R)$, assuming that the number of atoms is small ($\lesssim 100$) and the times of the pulses from the subsequent counting of decays are known. (5 refs.)

65771 Antiprotons at CERN. B.Southworth.
Endeavour New Ser. (GB), vol.7, no.1, p.19-23 (1983).
The unit of energy used in particle physics is the electronvolt (eV) which is the amount of energy picked up by an electron passing between the poles of a one-volt battery. Energies of a few eV are sufficient to pull electrons from atoms. Energies a million times higher (MeV) are involved when dealing with nuclear phenomena such as fission in reactors. To study the constituent particles of the nucleus, energies at least a thousand times higher still (GeV) are needed. The CERN antiproton project described here makes possible the highest collision energies ever achieved, but the total energy in the proton and anti-proton beams is still very small. What is important is that this energy is concentrated in a tiny amount of matter in the particle beam. (6 refs.)

65772 Uses of laser optical pumping to produce polarized ion beams. L.W.Anderson (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1051-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Laser optical pumping can be used to produce polarized alkali atom beams or polarized alkali vapor targets. Polarized alkali atom beams can be converted into polarized alkali ion beams, and polarized alkali vapor targets can be used to produce polarized H^- or $^3He^-$ ion beams. The author discusses how the polarized alkali atom beams and polarized alkali vapor targets are used to produce polarized ion beams with emphasis on the production of polarized negative ion beams. (30 refs.)

65773 RISOAR: a facility for production of beams of radioactive ions. R.N.Boyd, L.Rybarcyk, M.Wiescher, H.J.Hausman (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1387-90 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A facility to produce beams of low energy and radioactive ions such as ^7Be, ^{11}C, ^{13}N, ^{15}O and ^{19}Ne is presently under construction at The Ohio State University. The beams, having expected intensities of order 1×10^6 ions/s and energies of 8 to 16 MeV, will be directed onto a hydrogen or helium gas cell, where the reaction products from proton or α-particle radiative capture reactions, or from particle transfer reactions, will be observed. The results of these reaction studies are of interest to fast nucleosynthesis, the mode of stellar environments surrounding an accreting neutron star, or in the region of a supernovae. The present paper describes the general operation of the facility as well as some of the details associated with specific sections of it. Also discussed is a time scale for completion of the project and initiation of the first experiments on it. (4 refs.)

65774 High current DC ion beams. M.R.Shubaly, M.S.de Jong (Accelerator Phys. Branch, Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1399-401 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Development of high-current CW accelerators such as ZEBRA and FMIT, use of high current DC ion beams in industry for sputtering and material treatment, and scientific applications such as heavy-ion fusion and plasma physics diagnostics have provided the impetus for ion source development programs at many laboratories. At Chalk River, development of efficient plasma generators and reliable extraction columns to provide high quality beams of hydrogen, nitrogen, argon and xenon is underway. DC beams of up to 850 mA (limited by available power supplies) of hydrogen, 200 mA of nitrogen, 155 mA of argon and 100 mA of xenon have been produced with good reliability. DuoPIGatrons, with and without magnetic cusps, are used to generate a high density, reasonably quiescent plasma. Multi-aperture accel-decel columns are used for extraction with shaped apertures and beamlet steering to improve beam quality. This paper describes the performance of these sources and identifies some of the remaining problems. Guidelines for extraction column design, and experience with transporting high current beams are also presented. (5 refs.)

65775 Proton RFQ accelerator with high duty cycle. A.Schempp, H.Deitinghoff, P.Junior, H.Klein (Inst. fur Angewandte Phys., Univ. Frankfurt/Main, Frankfurt/Main, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1425-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The radio frequency quadrupole accelerator concept uses RF fields for acceleration and focusing of low energy beams. The RFQ offers attractive features as the acceptance of a DC beam directly from the ion source and acceleration of intense beams with large space charge forces. The zero-made resonator design offers several advantageous properties, as simple construction, good RF behaviour and the possibility of very high duty cycle operation. A prototype proton accelerator for 10-360 keV (108.5 MHz) has been built and the status of this project will be reported. (13 refs.)

65776 RFQ1: a 600 keV, 75 mA CW proton accelerator. M.R.Shubaly, J.C.Brown, B.G.Chidley, M.S.de Jong, L.D.Hansborough, R.M.Hutcheon, G.E.McMichael, S.O.Schriber, R.B.Turner, J.Ungrin (Chalk River Nuclear Labs., Res. Co., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1428-30 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The RFQ1 accelerator is being built, as part of the ZEBRA program, to study the physics and engineering challenges of launching a moderate energy (600 keV), high current (75 mA) CW proton beam with good beam quality and reliability. The RFQ1 injector will provide a 50 keV proton beam with current variable from zero to ~125 mA at fixed energy and filling a defined ellipse in phase space. Design output current is 75 mA, however operation at higher current is anticipated. This paper describes the constraints on the design, the preliminary design and the present status of the project. (4 refs.)

65777 High energy beam transport system for the 45 MeV proton LINAC at NEN. W.G.Mourad (New England Nuclear Corp., N Billerica, MA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1442-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The high energy beam transport (HEBT) for the 45 MeV proton LINAC is described. Design objectives of an isotope production line and a beam dump line are discussed. Design criteria, beam degrading effects, misalignment, second order and higher effects are described, and preliminary test results are shown. (4 refs.)

65778 Vane coupling rings: a simple technique for stabilizing a four-vane radiofrequency quadrupole structure. D.Howard, H.Lancaster (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1446-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The benefits of stabilized accelerating structures, with regard to the manufacture and operation, have been well documented. The four-vane radiofrequency quadrupoles (RFQ) presently being designed and constructed in many laboratories are not stabilized because of the weak electromagnetic coupling between the quadrant resonators. This paper presents a simple technique developed at the Lawrence Berkeley Laboratory using vane coupling rings (VCRs) which azimuthally stabilize the RFQ structure and greatly enhance its use as a practical accelerator. (7 refs.)

65779 Intense neutron source. R.J.Walko, J.P.Brainard, A.A.Riedel, J.B.O'Hagen, F.M.Bacon (Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1449-52 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A ScD_2 target film 5×10^{-5} m thick, tested in a UHV compatible 200 keV deuterium accelerator baked to 460°C, maintained a D-D neutron output rate of $1.0\text{-}1.2\times10^{11}$/s for 80 out of 140 hours of operation. This result demonstrates that a D-T neutron generator capable of a neutron output rate of 1×10^{13}/s and having a target lifetime suitable for cancer therapy is possible. Contrary to sputter rate data, ErD_2 target films appear to erode about twice as fast as ScD_2 films, making ErD_2 unsuitable as a target material. A low pressure ion source has been developed to replace the high pressure duopigatron. Experiments have verified that the single ring magnetic cusp ion source can deliver 200 mA of deuterium ions ($\approx$60% D^+) at 10-15 A of arc current with a background deuterium pressure of 0.26-0.40 Pa. This source will improve the safety of a D-T machine by reducing the tritium inventory by a factor of 6, and by utilizing the Zr-Al getter as the gas reservoir. (10 refs.)

65780 Reduction of ripple voltage in a Dynamitron. A.Langsdorf,J. (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1453-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The author determines that a precise neutralization of the RF ripple voltage on the high voltage terminal of a Dynamitron has previously been prevented by a nonnegligible phase shift of RF currents in the two halves of the $\sim$100 kHz class C oscillator tank circuit, which is actually constituted of two slightly unequal high-Q coupled circuits because it has two ground points: the inescapable center-tap-ground in the capacitive legs and a center-tap-ground lead to the induction coil. The latter is needed to prevent damage by flashover transients; equivalent to its removal was the adjusting of RF ground return current to a null by aid of a current transformer on this lead and the suitable adjusting of trimmer capacitance. While the phase shift was thus held to a null, the actual ripple amplitude on the HV terminal was minimized by adjusting additional trimmer capacitances installed in the terminal of the machine. Then p/p 100 kHz ripple at 2 MV DC output was reduced to about 50 V and RMSD resolution by (p,γ) resonance threshold data near 1 MV was about 250 V. This limit to resolution has various causes including mechanical vibrations and unbalanced harmonics of the RF. (1 ref.)

65781 RFQ development at LBL. S.Abbott, D.Nrodzik, R.A.Gough, D.Howard, H.Lancaster, R.MacGill, S.Rovanpera, H.Schneider, J.Staples, R.Yourd (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1456-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The radio frequency quadrupole (RFQ) is a structure which can efficiently focus, bunch and accelerate low velocity ion beams. It has many features which make it particularly attractive for applications in the biomedical and nuclear sciences. There are two projects in progress at LBL where the incorporation of heavy ion RFQ technology offers substantial benefits: in the upgrade of the Bevatron local injector, and in the design of the Bevatron local injector, and in the design of a dedicated heavy ion medical accelerator. In order to meet the requirements of these two important applications, a 200 MHz RFQ structure has been designed for ions with charge to mass ratios as low as 0.14, and a low RF power scale model has been built and tested. Construction of the high power model has begun. The status of this project is reviewed and a summary of technical specifications given. (8 refs.)

65782 Factors affecting the operating characteristics of the Zetatron: a small neutron generator for borehole logging. R.S.Berg, E.L.Jacobs (Tube Dev. Div., Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1459-62 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The Zetatron is a small deuterium-tritium accelerator which uses a reflect discharge ion source and approximately 130 kV acceleration from a pulse transformer. The dominantly D(T,n) He reaction takes place in an occluder target consisting of a Scandium deuterotritide film deposited on a molybdenum slug. The instantaneous energy deposition rates at the target, the species present in the beam, and the beam profile determine target life and neutron output characteristics. The target temperatures are calculated for a single pulse and compared measurements of the thermal profile on a specifically-prepared, thin-target substrate. Target images are shown which illustrate the beam imaging process. The beam is found to consist of an intense spot 2-4 mm in diameter surrounded by a halo approximately the size of the target. The implications of such a beam profile are discussed. Computer codes are used to model the beam and to describe the parts of the tube that control the beam characteristics. (3 refs.)

65783 The EBIS-RFQ couple: a fully matched heavy ion 3rd pre-injector and Saturne. M.Olivier, J.Faure, J.L.Laclare, J.M.Lefebvre, G.Leleux, A.Ropert, A.Tkatchenko, M.Tkatchenko (Lab. Nat. Saturne, CENS, Gif sur Yvette, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1463-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Since 1978, the 3 GeV Synchrotron Saturne has routinely operated with proton, deuteron, helium beams and, since 1981 with polarized protons and deuterons. Heavy ions are expected in the Summer of 1983 by using a new pre-injector presently under construction. As proposed by R.W. Hamm the marriage of an EBIS and an RFQ can be looked upon generally as a very good means of production of heavy ion beams at low energy because it combines high charges states, therefore low voltage on the terminal, and low velocity acceleration. After the RFQ, the beam is injected into Saturne through 20 MeV Alvarez linac. (29 refs.)

65784 Confinement of pulse-injected external ions in magnetostatic and electrostatic ion traps. H.A.Schuessler, Chun-Sing O (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1468-71 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Numerical methods are used to evaluate the confinement properties of both a Penning ion trap and a purely electrostatic ion trap for pulsed ion injection from an external source. Hereby the optimum time intervals for switching on the storage fields are obtained for singly charged ions of mass 100 u and energies up to 100 eV, as an example. For the Penning trap only axial injection along the external magnetic field is feasible. In the case of the purely electrostatic trap both axial and radial-equatorial plane incidence directions are considered. It is shown that for both storage devices practically all ions in a pulse of one microsecond duration can be tapped for properly chosen time delays and injection parameters. (9 refs.)

65785 Compensation of aberrations in achromatic quadrupole doublets. F.W.Martin (Microscope Associates Inc., Dedham, MA, USA), R.Goloskie.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1472-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

An achromatic quadrupole lens contains an electric and a magnetic quadrupole lens operated at the proper field ratio. Using a doublet of achromatic lenses in which a quadrupole voltage may be applied to the magnetic poles of one of the lenses in order to rotate its principal section, the author has eliminated simultaneously what may be called three first order aberrations of a quadrupole doublet. These are chromatic aberration, rotational misorientation, and focus. By adding suitably chosen small potentials to the quadrupole excitation of an electric lens, 2nd order parasitic aberration may be compensated. Experimental procedure for compensation is described. The procedure appears capable of improvement, and further work is warranted. Currently a beam of 600 keV protons with a width of 0.6 micron is obtained. (8 refs.)

65786 Axially symmetric electrostatic and magnetic fields for ion beam focusing. J.C.Kelly (Dept. of Electrical & Computer Engng., Arizona State Univ., Tempe, AZ, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1476-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The electric field between two oppositely charged concentric cylindrical conductors is proportional to $1/r$ where r is the radial distance from the axis of the pair of conductors. The magnetic field around a straight wire carrying a current is also proportional to $1/r$. Both these fields can act as ion or electron beam lenses for hollow tubular beams. Coaxial with the conductors. For the beam moving close to the inner conductor, r small, the fields are strong and powerful focusing is possible. Some of the characteristics of these new systems are described, recent applications mentioned, and future uses suggested including the generation of synchrotion radiation. (15 refs.)

65787 Theoretical considerations associated with the production of negative ions in sputter-type ion sources. G.D.Alton (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1480-90 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Processes which are important to the optimum formation of negative ions by sputtering in the presence of an alkali metal are discussed. Negative ion generation probabilities calculated from several theoretical models including the tunneling, Norskov and Lundqvist (1979), 'freezing' approximation of Overbosch and Los (1981) as well as modified surface ionization theories (Alton et al., 1979) are compared with experimental observation. An analytical expression is introduced which reproduces with good accuracy observed maximum work function changes for electropositive adsorbates on metallic adsorbants. The expression is extremely useful for computing the value of the work function at its minimum which in turn can be used in the appropriate model for computing optimum negative ionization probabilities. (32 refs.)

65788 New developments in atomic beam polarized ion sources at ETH-Zurich. W.Gruebler, P.A.Schmelzbach (Lab. fur Kernphys., ETH, Zurich, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1491-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

For the production of negative ions, which are particularly interesting for tandem accelerators and for use in high energy machines by application of charge exchange and multiturn injection, either a double charge exchange in an alkali vapour or the direct ionization of the atoms by a neutral Cs beam is used. In the last few years substantial progress on the performance of the electron impact ionizer and the double charge exchanger has been made in the authors' laboratory. A proton or deuteron beam intensity of over 100 μA has been observed in the positive stage of the source. A polarized negative ion intensity of 6 μA was obtained after the charge exchange. After acceleration in the ETH EN-tandem accelerator 2 to 3 μA of polarized deuterons with 90% polarization could be focussed through a 3 mm diameter collimator on a target. This is the highest value ever reported for an accelerated beam. (15 refs.)

65789 Calculated and measured emittance of a sputter-type negative-ion source. J.H.Billen (Dept. of Nuclear Engng., Univ. of Wisconsin, Madison, WI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1495-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A method for calculating the beam current and emittance of a negative ion beam from a sputter-type source is described. Calculations are compared to measured emittance. The dependence of the emittance on ion source parameters such as cathode shape, exit aperture diameter, and cathode voltage is discussed. (7 refs.)

65790 Application of multiply charged ions to small accelerators. M.Muller (Gesellschaft fur Schwerionenforschung mbH, Darmstadt, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1499-501 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The Unilac injector ion source for multiply charged ions based on the work of Morozov (1957) and Pasyuk (1963) is described briefly. Beam performance and typical operating parameters are given with respect to recent modifications (1981). Technical limits of the present set-up are shown and a new ion source assembly is presented by which a better multipurpose ion beam application can be achieved. First test stand results of this so called 'compact-PIG-source' are discussed. (7 refs.)

65791 Experience with a double-compensating beam calorimeter. N.Jarmie, R.E.Brown, R.A.Hardekopf, R.Martinez (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1508-10 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

In an experiment to measure the D(t,α)n cross section at beam energies of 10 to 120 keV, the authors have developed a double-compensating beam calorimeter, based on a Swiss Design (Thomann and Benn, 1976) to measure the particle beam intensity. A Faraday cup is not useful because of considerable charge exchange in the target gas at such low beam energies. They calibrated the calorimeter both with 10- and 3-MeV protons (comparing with a Faraday-cup measurement of the beam flux) and with the heat generated in a precision resistor. Both methods agree and give a calibration accurate to ±0.08% over a range of 10 to 800 mW beam power. Beam powers as low as 5 mW may be used, but with less accuracy. The beam energy must be known in order to calculate the particle intensity. Some difficulties with and peculiarities of the device are discussed. (5 refs.)

65792 Dynamic control of accelerator systems utilizing microprocessor technology. H.F.Malone,Jr. (Radiation Dynamics Inc., Melville, NY, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1511-13 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The design and execution of an accelerator control system can be a complex task. Developing sophisticated control elements and associated dialogue usually leads one to strongly consider a top down design. Microprocessing technology recently developed, allows much more flexibility, expandability, performance, security, accuracy and most of all reliability, to control systems as compared to their analog counterparts. Microprocessors have provided industry with an inexpensive control vehicle. As one views these devices over time one sees prices dropping as capability increases, yielding lower cost per function. The author discusses general design considerations, terminal voltage and scan control, beam control, and parameter control functions. (3 refs.)

65793 An absolutely calibrated source of 6.13 MeV gamma-rays. H.Mach, D.W.O.Rogers (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1514-17 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
At the 340 keV resonance in the $^{19}F(p,\alpha\gamma)^{16}O$ reaction, after kinematic corrections, there is a 1:1 correspondence between the 55° yield of alpha particles feeding the 6.13 MeV state and the yield of 6.13 MeV photons observed at 55° to the proton beam. The 55° intensities of alpha particles feeding the various states in ^{16}O were found to be: $\alpha_{6.05}$: $\alpha_{6.13}$: $\alpha_{6.92}$: $\alpha_{7.12}$=≤0.14: 100: 0.08: 2.6 which implies the only non-negligible contaminant is a 7.12 MeV gamma-ray radiation with an intensity of 2.6%. After a number of small corrections, including those for photon attenuation in the target backing and air, the fluence of 6.13 meV gamma-rays can be determined absolutely with an uncertainty of ~1%. Excellent agreement was obtained in a comparison of the calculated and measured efficiencies of a 5″×4″ NaI detector. The calibration of Ge(Li) detectors required an aluminium coated target to avoid a Doppler tail on the 6.13 MeV photon peaks caused by ^{16}O nuclei recoiling from the surface of the CaF_2 target. (16 refs.)

65794 Bunching characteristics of a buncher using helical resonators. Chen Chia-erh, Guo Zhi-yu, Zhao Kui (Dept. of Tech. Phys., Peking Univ., Beijing, China). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1524-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A RF buncher consisting of two coupled helices tuned to 28.4 MHz was tested on the beam line of a 400 KV DC injector. Bunched waveforms versus RF power input were measured and analysed. With 8.4 W power input the proton beam was compressed to 1 ns (FWHM) bursts. The beam pulse splitted into double peaks at a higher power level depending on the initial energy dispersion. Both peak separation and the pulse height changed remarkably with increasing power input, and the overlapping of peaks in neighbouring cycles occurred alternately. By making use of phase diagram in time-energy space a simple formalism is presented for the analysis of the bunching characteristics. Results obtained are well consistent with the experiment. The effect of the quadrupole lens on bunched waveform was also observed and discussed. (9 refs.)

65795 Calibration of an analyzing magnet using a time-of-flight technique. W.N.Lennard, D.Phillips, R.Hill (Chalk River Nuclear Labs., Atomic Energy of Canada Ltd. Res. Co., Chalk River, Ontario, Canada). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1532-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The authors have calibrated the analyzing magnet (Danfysik 90° sector, double-focussing, 2 m radius) serving the CRNL 2 MV high voltage mass separator. The method depends on a measurement of the time-of-flight, and thus of the velocity, of magnetically analyzed ions of known mass and charge state. Results have been obtained for ions in the mass range 1-208 amu for fields 0.4-12.8 kG. (7 refs.)

65796 Preparation and characterization of heavy ion targets. H.L.Adair, E.H.Kobisk (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1555-62 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Many of the same target preparation techniques used to fabricate samples to be bombarded with light ions (protons, deuterons, $^4He^{++}$, etc.) in various nuclear research studies can be and are used in fabricating targets for heavy ion interaction research. However, the experimental data obtained in heavy ion studies are far more sensitive to variations in target parameters than those resulting from light ion interactions. Careful consideration of anticipated results of the research must be given in selecting preparative techniques that can yield the desired target characteristics. Proper interpretation of experimental results demands that the target used is extensively characterized. Effects of specific target parameters, e.g. thickness, nuclidic uniformity, impurity concentration and identification, are reviewed. Preparative and characterization techniques are critically examined in terms of their effects on experimental results and on target lifetime. (20 refs.)

65797 Preparation of the elemental form of enriched isotopic materials for target fabrication. J.M.Heagney, J.S.Heagney (MicroMatter Co., Eastsound, WA, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1563-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A review of reduction techniques employed to produce metal for the fabrication of isotopic targets used in nuclear physics is presented. The methods discussed take into account the small quantities of material available, as well as the chemical forms in which the separated isotopes are provided. For some materials, several alternative reduction techniques are given to allow for variations in available equipment and the final fabrication technique to be employed. Advantages and disadvantages with respect to yield and resultant metal purity are discussed. A table of pertinent data and recommendations is presented. (7 refs.)

65798 Preparation of nuclear accelerator targets by focused ion beam sputter deposition. H.Folger, J.Klemm, M.Muller (GSI, Darmstadt, Germany). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1568-72 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A duoplasmatron ion source with einzellens extraction was used to prepare focused beams of 10-30 kV of Ar ions with intensities of 1 mA. An em/m-analysis was performed to study the general behaviour of the source. The composition of the beam was investigated to trace and reduce contaminations from extraneous source materials. The Ar-ion beam was applied to sputter milligram-amounts of chemical elements and enriched isotopes of elements having high melting points, such as Zr, Mo, Ru, Ta, W, Ir, etc. The sputtered substances were collected in thicknesses varying from 0.01÷2.0 mg/cm^2 onto thin target backings of C, Ti, Cu, or Pb. Self-supported targets were obtained by dissolving backings chemically. Among others, targets of ^{182}W and ^{184}W with thicknesses from 0.19-0.65 mg/cm^2 were thus prepared. Sputtering yields were measured for a series of different target materials. The results are discussed in detail. The targets have been fabricated for various experiments involving high intensity heavy ion bombardments with energies of up to 15 MeV/u of ^{58}Ni, ^{208}Pb, and ^{238}U ions at the GSI UNILAC accelerator. (13 refs.)

65799 Availability of enriched isotopic material for accelerator targets. E.Newman (Operations Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1573-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The electromagnetic isotope enrichment facility at the Oak Ridge National Laboratory provides a broad spectrum of highly enriched stable isotopes to the worldwide scientific community. The continued timely availability of these materials is of vital importance in many areas of basic research and, in particular, as source material for the fabrication of accelerator targets. A brief description of the facility and its capabilities and limitations is presented. (no refs.)

65800 Preparation and characterization of tritium targets. D.W.Ramey, H.L.Adair (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1575-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The Isotope Research Materials Laboratory (IRML) of the Oak Ridge National Laboratory (ORNL) prepares tritium targets that are used to produce an intense beam of 14.5 MeV neutrons by the $^3H(^2H,n)^4He$ reaction. The intense beams of 14.5 MeV neutrons are used in programs involving cancer research, materials evaluation, and materials identification. The tritium targets required by researchers have ranged in size from 1-cm diam. to 50-cm diam. and have contained from 3.7×M10^4 MBq to 2.2×M10^8 MBq of tritium. Important parameters in the performance of tritium targets, when bombarded with deuterons, include target lifetime and neutron output. These parameters are heavily dependent on the host metal layer used to form the tritide compound and the gas-to-metal loading of the host material. Fabrication procedures used in preparing titanium tritide targets with subsequent gas-to-metal determinations are described. (4 refs.)

65801 Preparation of relatively clean carbon backings used in charged particle induced X-ray studies for X-rays below 4 keV. P.Kocur, J.L.Duggan, R.Mehta, J.Robbins, F.D.McDaniel (Dept. of Phys., North Texas State Univ., Denton, TX, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1580-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
In a recent series of studies of M-shell ionization induced by protons, alpha particles, and fluorine ions, an unmanageable background of low energy contaminant X-rays was observed. These K-shell X-rays were primarily from Ca, K, Cl, S, P, Si and Na. The energy range of these contaminants is from 3.691 to 1.041 keV. The M-shell X-rays being studied were for various elements from U (~3.5 keV) down to Eu (1.5 keV). In order to evaluate and reduce the problem, the contaminants for carbon foils from a number of different manufacturers and a wide variety of foil float-off procedures have been studied. Carbon foils have been produced using carbon rods from several different manufacturers. Techniques are described that are most appropriate to reduce the above contaminants to a reasonable level. These techniques should be useful in trace element analysis (PIXE) studies and fundamental ionization measurements for low X-ray energies. (11 refs.)

65802 Bremsstrahlung beams from high-power electron accelerators for use in radiation processing. S.M.Seltzer (Center for Radiation Res., NBS, Washington, DC, USA), J.P.Farrell, J.Silverman. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1629-33 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The authors present the results of calculations of bremsstrahlung produced by a high power electron beam that is incident on a water cooled target. The calculation yields the efficiency of conversion of electron beam power to bremsstrahlung, the energy and angular distributions of the photons and the dose distribution of the resultant photon spectrum in a water phantom. The result is used to estimate radiation processing rates with bremsstrahlung photons and comparison is made with ^{60}Co radioisotope sources. (19 refs.)

65803 A compact neutron source for research and industrial applications. S.O.Schriber, M.A.Lone, B.G.Chidley, M.S.de Jong, S.A.Kushneriuk, W.N.Selander (Chalk River Nuclear Labs., Res. Co., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1668-70 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The use of neutrons as a diagnostic tool has become more extensive in radiography, nondestructive analysis, bio-medical investigations and other general research studies. Although most diagnostic neutron work has been conducted at large nuclear research reactors, there is a need for compact and semi-portable neutron sources. Such a neutron source can be based on a low energy proton linac and suitable target. Design of a compact, 100% duty cycle, 2.5 MeV proton linac that delivers 10 mA to a thick ^7Li target is described. Calculated thermal neutron peak flux with an H_2O moderator is 2×10^{11} n/cm^2.s. The associated low gamma ray yield results in the availability of good neutron beam quality for radiography and other purposes. (9 refs.)

65804 Target systems for radioisotope production. G.Pinto, M.Straatmann, D.Schlyer, J.Currin, G.Hendry (Cyclotron Corp., Berkeley, CA, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1797-800 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A high power target to hold plated radioisotope target material for irradiation by an external particle beam, has been designed and tested. The paper describes the design and use of the target and its handling system, the External Target System with Isorabbit Transport. The target has been shown to dissipate up to 6.4 kW of beam power over an area of approximately 15 cm^2 while maintaining the target surface temperature below 160°C. The target design was optimized by using finite difference analysis of various cooling fin geometries; close correlation is observed between predicted and measured target heat transfer properties. Also described are high yield and high specific activity, short-lived, radioisotope production systems using protons as the bombarding particle. These include a system for ^{15}O, ^{13}N, and ^{11}C gas pro-

duction; a system for ^{13}N-ammonia production by proton irradiation of water; and a system for ^{18}F production by irradiation of ^{18}O gas. (10 refs.)

65805 New application of the superthermal Ultra-Cold Neutron source. I. The search for the neutron electric dipole moment. R.Golub (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
J. Phys. Lett. (France), vol.44, no.9, p.L321-6 (1 May 1983).
A superthermal Ultra-Cold Neutron source containing a dilute solution of polarized ^{3}He in ^{4}He can provide a method for carrying out the search for the neutron electric dipole moment which will not place any limits on the solid angle of the incoming neutrons and eliminate losses due to several causes. (24 refs.)

65806 Studies for adjustable energy proton beams from proton linear accelerators. Xu Jian-ming, Zhou Qing-yi, Wang Shu-hong (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.42-50 (Jan. 1983). In Chinese.
The principle of adjusting the proton energy from the linear accelerator with energy adjusting cavities is proposed. The requirements of energy adjusting cavities for tuning the proton energy efficiently and continually are studied. The energy range adjustable and the energy spread are calculated for the 35 MeV proton linac which is in the course of construction at the Institute of High Energy Physics, as an example. The energy spread as a function of electric parameters of energy adjusting cavities are also discussed. A specific and economical method to supply RF power to energy adjusting cavities is presented. (5 refs.)

65807 On relations among objects, images and beam waists for charged particle beams. Yu Qing-chang (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.51-6 (Jan. 1983). In Chinese.
The relations among objects, images and beam waists for charged particle beams are studied. On this basis, the relations between geometrical electron optics and beam transport theory are discussed. (3 refs.)

65808 Autoacceleration of a modulated beam. V.A.Boiko, A.I.Borodulin, R.M.Voronkov, G.V.Voskresenskii, V.S.Galkin, V.V.Dobrokhotov, V.N.Kurdyumov, G.L.Mamaev, K.G.Simonov.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1331-3 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2163-7 (Nov. 1982). [received: May 1983]
The interaction of a density-modulated electron beam with a passive resonator is considered. The modulation frequency is equal to the resonant frequency of the resonator, and the beam parameters at the resonator outlet are studied as functions of the percentage of modulation. Calculations reveal that the maximum attainable energy at the outlet is approximately three times greater than the energy of the particles at the inlet. Experimental measurements of the beam parameters are reported. At the outlet of the passive resonator a beam of accelerated electrons was produced with current $\sim$100 A and energy $>$500 keV; the current in the initial beam was 250 A and the electron energy was 250 keV. (5 refs.)

65809 General aspects on the use of high duty factor electron and photon beams in the intermediate energy region. J.M.Laget (CENS, Gif-sur-Yvette, France).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.4-24 vol.1
The author shows what one gains by working with high duty factor electron beams, but also why there is a need to increase the nominal energy of the present generation of intense electron accelerators. (29 refs.)

65810 General review of methods to achieve high duty-factor electron and photon beams. H.Herminghaus (Inst. fur Kernphys., Univ. Mainz, Mainz, Germany).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.36-46 vol.1
A systematic of the various kinds of possible high duty cycle (100% of close to) electron accelerators is derived and some characteristics are briefly discussed. A map of—to the author's opinion—most favorable accelerator types in the T-J-plane is given. The use of internal targets as a special feature of storage rings is briefly discussed in two examples. (no refs.)

65811 Condensed jet technology for internal targets. J.Gspann (Inst. fur Kernverfahrenstech., Univ. und des Kernforschungszentrums Karlsruhe, Karlsruhe, Germany).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.85-103 vol.1
Partly condensed jets of gas expanding through nozzles are finding rapidly increasing interest for internal targets in accelerator or storage rings. In most cases, the jets are used as sources for what has been called 'condensed molecular beams'—or'cluster beams'. Only the core of the jet reaches the high or ultra-high vacuum of the ring via differential pumping stages where practically all the uncondensed residual gas is pumped off. The microparticles of condensed matter, or clusters of atoms or molecules, which make up the final target beam, have very little thermal velocity spread, hence, do not collide with each other, i.e. they are moving under molecular flow conditions. (20 refs.)

65812 Storage and acceleration of polarized electrons. D.Husmann (Phys. Inst., Univ. Bonn, Bonn, Germany).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.116-25 vol.1
A review of theoretical and experimental work on storage and acceleration of polarized electrons is given. The main topic concerns resonance depolarization, but also Sokolov-Ternov polarization and external sources for polarized electron beams are covered. (37 refs.)

65813 Internal targets at Bates. C.P.Sargent (Lab. for Nuclear Sci., MIT, Cambridge, MA, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.126-8 vol.1
Until the present time the Bates Linear Accelerator Laboratory has been a single-apparatus facility. Almost all of the experimental programs have used the high-resolution energy-loss spectrometer. There is now the new South Hall, with three new magnetic spectrometers and an opening-angle π^0 spectrometer undergoing final assembly and test. The accelerator energy has been increased to 725 MeV by recirculation. A polarized source is under construction. Within two or three years it is expected that increased RF power capability will increase energy to about 1 GeV, and that there will be beam sharing capability between the South Hall and the energy-loss spectrometer. The top priority for future development is to increase the duty-factor of the experimental beams, approaching 100% duty, as soon as possible. It might be possible by the end of 1987, and a proposal is now in preparation. The chosen method is to provide a pulse-stretcher ring. The ring will have a circumference of 300 meters, bend radius of 9 meters, with up to 9 turns of injection possible in order to insure at least 50 mA output current. Resonance extraction will be used to provide external beam with design goal 2×10^{-4} in momentum resolution and 30 πmm-mrad ($\beta\gamma=1$) normalized emittance. (no refs.)

65814 Possibilities for internal tagging in the energy region 100-500 MeV at the accelerator system MAX. J.-O.Adler, L.-J.Lindgren, B.Schroder (Dept. of Phys., Univ. of Lund, Lund, Sweden).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.129-36 vol.1
In view of the great interest in nuclear physics studies with electromagnetically interacting probes and that few high duty-factor electron acclerators exists, the authors investigate the possibilities for such studies in the intermediate energy region at MAX. This accelerator system consists of a 100 MeV racetrack microtron to be used as an injector to a multipurpose ring. In the stretcher mode the ring will provide a high duty-factor external beam. In the storage mode the energy may be increased to around 550 MeV. It is not possible to extract the beam above 100 MeV. The authors investigate internal tagging similar to the method used at the 500 MeV synchrotron at the University of Bonn. (7 refs.)

65815 Internal target experiments at an electron storage ring. S.G.Popov (Inst. of Nuclear Phys., Novosibirsk, USSR).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.150-72 vol.2
The author discusses the idea of locating the target directly in the track of the cyclic device-storage ring. (20 refs.)

65816 Compton scattering of laser light; techniques and results. G.Matone (Lab. Nazionali di Frascati, INFN, Frascati, Italy).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.173-95 vol.2
The author describes how to achieve backward Compton scattering of an intense polarized laser beam by high energy electrons to produce useful yields of nearly monoenergetic and polarized photons. (20 refs.)

65817 The Brookhaven medium energy gamma ray project. A.M.Sandorfi, M.J.LeVine, C.E.Thorn (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA), G.Giordano, G.Matone.
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.196-203 vol.2
Within the next year the authors hope to begin the construction of a facility that would provide intense beams of monochromatic and polarized photons with energies in the range of several hundreds of MeV. These γ rays will be produced by Compton backscattering laser light from the electrons circulating in the 2.5-3.0 GeV X-ray storage ring of the National Synchrotron Light Source (NSLS) at Brookhaven National Laboratory. The authors summarize the essential aspects and phases of development of the BNL facility. (1 ref.)

29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

65818 Features and performance of a gravity spectrometer for ultracold neutrons. A.Steyerl, B.Gmal, K.-A.Steinhauser, N.Achiwa (Fakultat fur Phys., Tech. Univ. Munchen, Garching, Germany), D.Richter.
Z. Phys. B (Germany), vol.50, no.4, p.281-8 (1983).
Reports on a novel ultrahigh-resolution neutron spectrometer utilizing the reach of the flight parabola of very slow neutrons in the Earth's gravitational field for precise energy definition. A full width at half maximum of (17.0 ± 0.6) neV was measured for elastic scattering from graphite. The authors were able to detect a line broadening by (6.6 ± 3.2) neV in quasi-elastic

scattering from a polymer in solution at a momentum transfer of 0.027 $Å^{-1}$ ħ. (30 refs.)

65819 Performance of a high efficiency position sensitive 30° parallel plate electron spectrometer. J.K.Swenson, D.Brandt (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1548-51 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A position sensitive parallel plate analyser (PSPPA) for the angle resolved study of electrons produced in ion-atom collisions has recently been built and tested. This new spectrograph consists of a 30° parallel plate analyser (PPA) equipped with a Chevron microchannel plate assembly with resistive anode encoding for one dimensional position analysis of electrons incident on the second order focal plane. The PSPPA has an electron detection efficiency of over 100 times that of conventional PPAs. (8 refs.)

65820 (e,e′X) experiments at NIKHEF-K. P.K.A.de Witt Huberts, L.Lapikas (NIKHEF-K, Amsterdam, Netherlands).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.60-72 vol.1
The present status of the instrumentation for (e,e′X) coincidence experiments and photopion production is reviewed. With the availability of high resolution in missing energy (<200 keV) and subnanosecond coincidence timing with two magnetic spectrometers a new generation of proton knockout experiments will be feasible. A series of approved experiments now underway is discussed. The authors show some first results and discuss future developments in experimentation. (14 refs.)

65821 Wide angle spectrometers for intermediate energy electron accelerators. P.Leconte (CENS, Gif-sur-Yvette, France).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.104-14 vol.1
Convinced by the advantage of the electromagnetic probe as a tool in nuclear physics, many people are now trying to develop new high energy electron accelerators with a main emphasis on very high duty cycle. Such efforts must be matched by equivalent improvements in detection efficiency. Increases in solid angle and momentum bite of spectrometers have therefore been discussed in great detail during recent workshops at Mainz and Argonne. The author shows that improvements of the detector acceptances (in solid angle and momentum bite) is as important as increased duty cycle for coincidence experiments. He points out also that they open the way to new possibilities for experiments: out-of-plane experiments and multiple coincidences, which are out of the reach of present facilities. (10 refs.)

65822 A spectrometer coupled to an electron storage ring for tagging laser backscattered gamma rays. C.E.Thorn, M.J.LeVine, A.M.Sandorfi (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.204-8 vol.2
A spectrometer has been designed to momentum analyze electrons, from the 2.5-3.0 GeV X-ray storage ring of the National Synchrotron Light Source at Brookhaven National Laboratory that have lost energy from the production of high energy γ-rays by Compton scattering of laser light. The electrons detected in the focal plane will provide a 'tag' for the backscattered γ-rays, determining their energy (to 2-3 MeV), and timing. This design utilizes the fact that, due to kinematics, the Compton scattered electrons have a transverse phase space negligibly different from that of the stored beam. It is constrained by the requirement of not altering any of the existing elements of the storage ring. In particular, no structures or fields interfere with the large aperture of the storage ring that is required for loading the ring. (4 refs.)

65823 A π^0 spectrometer for photopion production studies. M.J.LeVine, A.M.Sandorfi, C.E.Thorn (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.256-8 vol.2
One of the first experimental programs to be carried out with the BNL gamma-ray beam will be a study of (γ, π^0). The authors present a discussion of existing π^0 spectrometers and two new designs which, for the π^0 energy range of interest for this program, are superior to existing designs. (4 refs.)

65824 A charged-pion spectrometer for the BNL gamma ray beam facility. M.J.LeVine, C.E.Thorn, A.M.Sandorfi (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Workshop on the Use of Electron Rings for Nuclear Physics Research in the Intermediate Energy Region, Lund, Sweden, 5-7 Oct. 1982 (Lund, Sweden: Univ. Lund 1982), p.259-61 vol.2
The (γ,$\pi^{\pm}$) studies planned for the BNL gamma-ray beam facility necessitate the detection of charged pions in the energy range $25<T_\pi<150$ MeV with a modest resolving power to match the photon beam energy resolution (27 MeV). The solid angle must be as large as possible, and the total path length must be as short as possible to minimize the losses due to pion decay. (The mean lifetime corresponds to $L=4.87$ m for $T_\pi=25$ MeV). Finally, a means must be provided to reject pion decay products reaching the focal plane. A design for such a charged-pion spectrometer is presented. This design utilizes existing large aperture magnetic elements, and provides a momentum resolution of 0.68% at a solid angle of 50 msr, over a momentum range of 10%. (no refs.)

29.40 RADIATION DETECTORS

(for mass spectrometers, see 07.75)

65825 The use of Ge detectors for precision positron-endpoint measurements of short lived nuclei. F.T.Avignone,III. (Univ. of South Carolina, Columbia, SC, USA), D.M.Moltz, K.S.Toth, B.D.Kern, H.Noma.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1136-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A brief review of the development and application of techniques for measuring positron endpoint energies using intrinsic Ge detectors is given. The calculation of detector response functions using Monte Carlo methods is discussed. Multiple scattering, bremsstrahlung, photoelectron escape and interference from annihilation radiations are considered. The techniques were tested using well known endpoints of the decays of ^{27}Si, ^{58}Cu and ^{64}Ga. *Q*-values were determined for mass-separated samples of ^{76,77}Rb and ^{77}Kr produced in heavy ion reactions. (17 refs.)

65826 Use of bremsstrahlung in the measurement of the efficiency of solid state detectors below 5 keV. C.Quarles, L.Estep (Dept. of Phys., Texas Christian Univ., Fort Worth, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1518-20 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Atomic-field bremsstrahlung produced by the bombardment of atoms by an electron beam of 5-10 keV energy provides a continuous X-ray source which is suitable for the measurement of the relative efficiency of solid state detectors in the energy region below 5 keV. The relative efficiency as a function of photon energy can be obtained by normalizing the observed spectrum to the theoretical bremsstrahlung cross section. The authors present an example of this technique using a thin film target and a gas beam target to illustrate some of the problems and to demonstrate the potential of this technique. (9 refs.)

65827 Bismuth germanate as a high-energy gamma-ray detector. S.A.Wender (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1539-42 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Recently bismuth germanate ($Bi_4Ge_3O_{12}$), or BGO, scintillators have been developed with many properties that may make them an attractive alternative toNaI in many applications. The requirements of the detector system for the detection of gamma rays following high-energy neutron capture are that it have good energy and time resolution, high efficiency, and low sensitivity to neutron backgrounds. The author has constructed a detector system consisting of five 7.6-cm-long by 7.6-cm-diam-BGO scintillators spanning an angular range from 140 to 45 degrees in the reaction plane. Results of the measurements of the energy resolution, the absolute efficiency and the time resolution are presented. (11 refs.)

65828 The use of high purity germanium for the detection of 20 to 200 MeV light ions. D.L.Friesel (Indiana Univ. Cyclotron Facility, Bloomington, IN, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1543-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
While lithium-drifted germanium detectors have become an accepted tool for high resolution gamma ray spectroscopy, they were also shown to be excellent charged-particle detectors as well. Their use for this purpose was limited, however, by the practical complexities of their handling and storage at liquid-nitrogen temperature, and consequent incompatibility with typical nuclear research scattering chambers. Many of these difficulties were eliminated by the development of the high-purity germanium detector. A variable geometry detector telescope system using these high-purity planar germanium detectors has been developed and used at intermediate energies. A detailed description of the telescope system is presented, along with some practical experience of their use as light ion detectors. The effects of radiation damage and the radiation damage annealing procedures on detector properties and performance are emphasized. (15 refs.)

65829 Non-coincidence type background compensation for Geiger-Muller counters. R.C.Bhattacharya, P.K.Ghosh (Phys. Res. Wing, Projects & Dev. India Ltd., Sindri, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.1005-6 (Dec. 1982). [received: April 1983]
Background compensation in a GM counter is achieved by cancelling one count for every pulse in a second GM tube receiving background only. The method suits portable instrumentation. (no refs.)

65830 A new kind of particle detector using petrolic gas. Du Yuan-tsai, Li Jian-ping, Liu Shu-dong, Tang E-sheng (Inst. of High Energy Phys., Acad. Sinica, Peking, China), Li Xiang-cheng.
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.126-8 (Jan. 1983). In Chinese.
The authors have developed a new kind of particle detector using petrolic gas, which is based on the SQS (self-quenching streamer) discharge mode. It is possible to save a lot of money if this kind of detector will be used as some elements of high-energy spectrometers at electron-positron colliders or other kinds of high-energy accelerators. It is possible to use this kind of detector in low-energy nuclear technology, health physics and environment protection regions, too. (5 refs.)

65831 Absorption of averaged hadron cascades in an ionization calorimeter. V.P.Pavlyuchenko.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.12-16 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.16-20 (1982).
The averaged cascade curves are analyzed phenomenologically. It is shown that their absorption depends not only on the coefficient χ of the irreversible energy emission from the cascade hadron component, but also on its relative rate of change χ'/χ. (3 refs.)

65832 Properties of intrinsic germanium detectors at low energies by escape peak spectroscopy. B.Rosner, D.W.Mingay (Atomic Energy Board, Pretoria, S Africa).
X-ray Spectrom. (GB), vol.12, no.2, p.82-6 (April 1983).
The study of the energy resolution and linearity of germanium X-ray detectors at very low energies is difficult due to the degradation of the spectral line shapes resulting from incomplete charge collection in the detector's surface dead layer. The use of low-energy, K escape peaks obviates this difficulty as they are observed at depths characteristic of their full-energy parent photons. Measurements have been performed using particle-induced X-ray emission analysis of targets having characteristic K and L X-ray energies just above the Ge K-edge. The escape peaks retain pure Gaussian shapes down to the noise level of the detector and open up the possibility of a selective field of high-resolution escape-peak spectroscopy. (20 refs.)

65833 NRESP4 and NEFF4. Monte Carlo codes for the calculation of neutron response functions and detection efficiencies for NE 213 scintillation detectors. G.Dietze, H.Klein.
Report PTB-ND-22, Phys.-Tech. Bundesanstalt, Braunschweig, Germany (Oct. 1982), 45 pp.
Describes two Monte Carlo codes, NRESP4 and NEFF4, for calculating detector response functions and detection efficiencies of NE 213 scintillation detectors by incidence of fast neutrons in the energy range from 0.02 MeV to 20 MeV. The codes include neutron scattering effects in the Al detector housing and in a light pipe. An extensive set of cross section and differential

cross section data has been included. Various light output functions for protons may be used. (21 refs.)

65834 Light production from Gd_2O_2S intensifying screens. L.Bacarini, A.Di Lelio, R.Giacomich, F.Tomasini.
Report INFN/TC-83/1, Ist. Naz. Fis. Nucl., Trieste, Italy (15 Jan. 1983), 23 pp.
The physical parameters of absorption and the light conversion efficiency have been measured by means of a NaI spectrometer and the SPC technique. This allows the authors to calculate the number of light photons emitted per incident X-ray having different energies (from 10 to 120 keV), and therefore the total efficiency curves ('Absolute Speed Curve' ASC). The phenomenon of ionisation energy loss due to fluorescent X-rays production for incident X-rays having an energy above the K-edge of the Gd, was evaluated as well as the particular behaviour of the T_{16B} whose high thickness makes the phenomena of internal light and fluorescent X-ray absorption important. (8 refs.)

65835 Reconstruction of data in low-mass magnetostrictive chambers. H.M.Daley.
Report RL-82-086, Rutherford Appleton Lab., Chilton, Oxon., England (Jan. 1983), 16 pp.
This report describes the reconstruction of spark positions in a set of low-mass spark chambers with remote magnetostrictive readout, used by a Rutherford Laboratory experiment. (4 refs.)

65836 Track reconstruction in an inhomogeneous magnetic field for a polarised target experiment. R.Maybury, H.M.Daley.
Report RL-82-087, Rutherford Appleton Lab., Chilton, Oxon., England (Feb. 1983), 41 pp.
This report describes a program which was developed to reconstruct particle tracks through a number of detectors in the fringe field of a polarised target magnet used in a Rutherford Laboratory experiment. The method uses weighted line fits to follow tracks distorted by the magnetic field. (5 refs.)

(see also 29.30 Radiation spectrometers and spectroscopy, 29.40 Radiation detectors; for dosimetry, see 87.60M)

65837 Design and test of a Cerenkov detector system for studying parity violation effects in electron-nucleon scattering. J.Ahrens (Max-Planck-Inst. fur Chem., Mainz, Germany), K.-J.Dietz, H.-J.Gessinger, H.-J.Kluge, F.Neugebauer, E.-W.Otten, H.-H.Andresen, W.Heil, R.Neuhausen, R.Thornagel, B.Wagner.
AIP Conf. Proc. (USA), no.95, p.159-6 (1982). [received: April 1983] (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).
Describes an experimental set up for the measurement of the parity violation by weak neutral currents in the quasi-elastic scattering of 300 MeV longitudinally polarized electrons. It consists of the polarized electron source, the 300 MeV linear accelerator at Mainz, several monitors for the detection of the properties of the electron beam (intensity, energy, position, polarization), a Be target (15 mm thick), and the gas Cerenkov counter. A careful analysis of the performance of the detector system (signal to background ratio, apparative asymmetry) has been performed with unpolarized electrons. Some results are presented. These tests indicate that the neutral current effect can be measured within 15 h to confidence level of 99.5%. (no refs.)

65838 Statistical fluctuation problem in pulsed radiation diagnostics. Lu Min (Inst. of Atomic Energy, Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.216-24 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
When the waveform of a radiation pulse is measured, a large number of a radiation particles interact with the detector simultaneously. The output current waveform is proportional to the waveform of the radiation pulse. The statistical fluctuation phenomenon will appear when the radiation source is relatively weak or the sensitivity of the detector is low. The fluctuation phenomena are considered and mathematical expressions for fluctuations are given. The author also discussed the uncertainty due to statistical fluctuation of various pulse parameters measured, such as amplitude, width, time interval and other special parameters. (2 refs.)

65839 Characteristics of a detector of tagged neutrinos. I.P.Nedyalkov (Inst. of Nuclear Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.12, p.1651-4 (1982).
Accuracy of measurement, detection time and other characteristics of a detector of tagged neutrinos were studied. The energy of the neutrinos was assumed to be higher than a few TeV. The investigation was made within the framework of the Weinberg-Salam-Glashow theory. (35 refs.)

65840 Experiments with sub-nanosecond tandem beam pulses. S.L.Tabor, G.Neuschaefer (Dept. of Phys., Florida State Univ., Tallahassee, FL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1504-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The beam pulsing system, which was installed on the Florida State University FN tandem accelerator to prepare the beam for injection into the superconducting linac booster, has been used for a variety of experiments. The system has been used to study the $^{11}B(d,n)^{12}C$ reaction at 12 MeV. Neutrons were detected in a plastic scintillator viewed by two photomultiplier tubes connected to a mean timer circuit. The overall timing resolution of about 500 psec provides adequate time-of-flight resolution at a distance of 2 m. Of particular interest in this reaction are a triplet of states in ^{12}C between 18 and 21 MeV which have recently been studied in several intermediate-energy experiments. Another experiment has used the pulsed beam in conjunction with the mid-column stripper to search for nanosecond isomers and yrast traps with the $^{28}Si+^{56}Fe$ reaction at 103 MeV. (9 refs.)

65841 Energy dependent instrumental delays. M.A.Raoof (Dept. of Phys., King Saud Univ., Riyadh, Saudia Arabia), S.A.Raoof.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1552-H (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Energy dependent delays in the case of a coincidence beta spectrometer and the detecting system have been studied. Both the ends of the spectrometer were coupled with scintillation counters comprising of plastic scintillator pilot U and sub-nanosecond rise time photomultiplier RCA C70045D. Timing pulses were processed by electronic units, which included Ortec, TFA, CFPHD and Biased TPHC. Conversion electrons from Ir-192 were utilized for these studies. In one channel of the spectrometer fixed energy 468 KeV K-conversion electrons were focused, while different energy electrons in the range of 468 to 670 KeV were focused in the other channel. Moments of the resulting delayed time spectra were calculated about the mean of peak position as a function of difference in energy of the radiations in the two channels. A polynomial fitting to the experimental points was used. The results show a nonlinear character even over an energy range of 200 KeV. (8 refs.)

65842 Measurement of the number of radioactive atoms and the half-life. IV. Applications and accuracy of N_0. Feng Xi-zhang, Zhao Zhen-lan, Guo Ying-huan, Lo Shi-hua, yang Rui-Ying, Huang Zhong-xiang, Jiang yong (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.114-17 (Jan. 1983). In Chinese.
The applications of N_0, the number of atoms of a certain radioactive isotope in a target at a given time t_0 (usually the end of a bombardment by incident particles) in the measurement of the reaction cross section or the beam intensity or in the activation analysis are discussed and the accuracy of N_0 (also the cross section) is analyzed. (no refs.)

65843 Detection of neutrino at large distances from the accelerator. V.A.Tsarev, V.A.Chechin.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.17-21 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva,* no.8, p.21-5 (1982).
Simple expessions are obtained for the count rate of neutrino events in detectors with external and internal targets positioned at large distances from the accelerator. (2 refs.)

29.80 NUCLEAR INFORMATION PROCESSING

65844 Data communications in high energy physics. M.G.N.Hine (CERN, Geneva, Switzerland).
Europhys. News (Switzerland), vol.14, no.2, p.4-6 (Feb. 1983).
Outlines the development of data networks for use in high energy physics research where many universities may collaborate on one project. (1 ref.)

65845 Information system for generation availability - Executive summary. R.W.Keller.
Report EPRI-NP-2875, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 28 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
This report presents a summary of EPRI-sponsored research into the requirements, applications, and design of an information system for generation availability (ISGA). A review of the program's accomplishments is provided, and a guide is included to the available material, the majority of which is in a form that enables direct adaptation and application by individual utilities. EPRI funding and industry support for the ISGA, initiated in 1976, were terminated in 1982.

65846 Organization and structure of an EPRI DATATRAN data bank. G.A.Cordes, G.A.Mortensen.
Report EPRI-NP-2873, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 64 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
Details of the EPRI DATATRAN executive computer code and data base management system are provided. Composition of the data base is described, and the organization of the data bank and the structure of the data in the data bases are presented along with a description of the DATATRAN module SELECTB, which is used to sort the data.

30.00 ATOMIC AND MOLECULAR PHYSICS

(for physical chemistry, see 82.)

31.00 THEORY OF ATOMS AND MOLECULES

(see also 71. Electron states in condensed matter)

31.10 GENERAL THEORY OF STRUCTURE, TRANSITIONS AND CHEMICAL BINDING

65847 Topological analysis of the current density field in molecules. J.A.N.F.Gomes (Dept. de Quimica, Faculdade de Ciencias, Porto, Portugal).
THEOCHEM (Netherlands), vol.10, p.111-27 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
A global qualitative theory of the current density has been very recently introduced by the author. These topological studies are reviewed and special attention is given to the shape of the separatrices which encase both toroidal and axial vortices. (20 refs.)

65848 Atomic physics of negative ions: a report on the US-Mexico joint workshop. T.J.Morgan (Phys. Dept., Wesleyan Univ., Middletown, CT, USA).
Comments At. & Mol. Phys. (GB), vol.12, no.5-6, p.319-26 (1983).
A workshop on the atomic physics of negative ions was held recently in Galindo, Mexico. Forty physicists from six countries participated, and twenty-six invited presentations reviewed the field. This report summarizes the motivation for such a workshop and outlines some of the highlights. (6 refs.)

31.15 GENERAL MATHEMATICAL AND COMPUTATIONAL DEVELOPMENTS

65849 Energy variation and elementary Jacobi rotations. R.Carbo, L.L.Domingo, J.Peris (Dept. de Quimica Organica, Inst. Quimic de Sarria, Barcelona, Spain), J.Novoa.
THEOCHEM (Netherlands), vol.10, p.15-33 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
A general exploration of elementary Jacobi unitary transformations is carried out in order to accomplish, within the LCAO-MO scheme, the minimum search of the electronic energy expression for any system and to construct an optimal wavefunction. It has been found that when comparing the Jacobi procedure with the classical SCF schemes, based on coupling operators, some facts portray the unitary transformation technique as an excellent candidate to compute energy and an alternative way to take into account SCF procedures. (13 refs.)

65850 Topological elements of the magnetically induced orbital current densities. J.A.N.F.Gomes (Dept. de Quimica, Faculdade de Ciencias, Porto, Portugal).
J. Chem. Phys. (USA), vol.78, no.7, p.4585-91 (1 April 1983).
A detailed topological analysis is given, both for the standard orbital current density and for the complete orbital current density. The concepts developed here provide a very useful instrument for the description of the vector field of the magnetically induced currents and should be very helpful for the understanding of the contributions that different regions of a molecule give to its magnetic properties. The ingredients for this topological analysis are (1) the symmetry properties of the electronic Hamiltonian in the presence of the magnetic field and (2) the nature of certain singular points. Two categories of singular points are considered: (i) Nodal vortices which have associated a circulation around a nodal line and may be of the axial or toroidal types as previously considered by Hirschfelder (1980); (ii) Stagnation points where the current vanishes without the vanishing of the charge density. There is a considerable variety of stagnation points and, under certain conditions basically on the magnetic field, they may have associated a vortical circulation of currents in their immediate neighborhood. For the complete orbital current (defined as the sum of the standard orbital current and the orbital exchange current), the stagnation points may occur isolated or they may form stagnation lines. When the regime of the circulation around this line changes between vortical and normal, a new type of stagnation point, the transition point, is found. (17 refs.)

65851 An improved approximate energy formula for molecules in terms of corrected free atom energies. E.A.Castro, F.M.Fernandez (Seccion Quimica Teorica, Inifta, La Plata, Argentina).
J. Chem. Phys. (USA), vol.78, no.7, p.4782-3 (1 April 1983). (10 refs.)

65852 On the localization of the resonance state wave function in the complex coordinate method. K.Deguchi, Y.Kato, K.Nishikawa, S.Aono (Dept. of Chem., Kanazawa Univ., Kanazawa, Japan).
J. Chem. Phys. (USA), vol.78, no.8, p.5272-3 (15 April 1983).
The complex coordinate method (CCM) developed by Aguilar, et al. (1971) and Simon (1972) is now being recognized as a useful method directly capable of estimating resonance positions and widths. An important feature of the CCM is that resonance states are obtainable in terms of only square integrable basis functions, as are bound states. Hence, any explicit asymptotic boundary condition which make calculations of resonance states very cumbersome is not required in the CCM. The CCM has been so far applied to many electronic and nuclear resonance problems. It seems, however, that many attempts have concentrated on calculations of resonance state energies while behaviours of the corresponding wave functions have been little investigated. The authors investigate the localization of the resonance state wave functions in the CCM within the framework of a simple two-state model. In order to look at the wave function behaviors in the vicinity of the inner region, they adopt here the stabilization method. (6 refs.)

65853 The valence-bond self-consistent field method (VB-SCF): theory and test calculations. J.H.van Lenthe, G.G.Balint-Kurti (School of Chem., Bristol Univ., Bristol, England).
J. Chem. Phys. (USA), vol.78, no.9, p.5699-713 (1 May 1983).
A new and very general form of valence-bond theory is described. In this theory the molecular wave function is written as any desired linear combination of valence-bond structures, and the nonorthogonal orbitals used in the construction of the valence-bond structures are allowed to distort to their optimal shapes. The orbital optimization is achieved through successive transformations of an orbital basis. The theory of the method is based on an extension of the 'generalized Brillouin theorem' which is presented in the text. The new VB-SCF method is a generalization of the molecular orbital MC-SCF method to permit the use of nonorthogonal orbitals. It, therefore, encompasses the MC-SCF method as a restricted subclass. Several different forms of restriction may be imposed on the orbitals and on the optimization procedures. One of these only allows orbitals centered on the same atom to mix during optimization and in this way generates optimal hybrid orbitals, which it is expected will improve to be of particular interest in providing simple qualitative descriptions of the chemical bond. Test calculations are presented for LiH, He_2^+, and for the ground-state potential energy curve of OH. The VB-SCF wave function and optimized orbitals may be used as a starting point for the construction of a larger multistructure valence-bond wave function which the authors term a VB-CI function. The VB-SCF and VB-CI results presented in the paper show that the method is capable of yielding very accurate molecular potential energy curves. (54 refs.)

65854 Comment on: 'A quantum analog to the classical quasiperiodic motion' [and reply]. S.Mukamel (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA), G.Hose, H.S.Taylor.
J. Chem. Phys. (USA), vol.78, no.9, p.5843-6 (1 May 1983).
Hose and Taylor's article (ibid., vol.76, no.11, p.5356, 1982) on the conventional local stability condition of the Wigner-Brillouin perturbation series, suggesting that it may function as a means for identification of quantum mechanical levels corresponding to classical quasiperiodic motion, is discussed. Mukamel's criticisms are rebutted in Hose and Taylor's reply. They state that the comment is based on several misconceptions. (9 refs.)

65855 On the quantum defect method. I.Bulboaca (Inst. de Fizica si Inginerie Nucleara, Bucuresti, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.34, no.10, p.891-904 (1982). In Rumanian.
After a brief presentation of this method designed for calculations of atomic structures, the author examines a one-channel and a two-channel problem respectively. Calculation methods based on empirical data are proposed, and the results are compared with those previously reported in literature. (9 refs.)

Dynamic representation of quantum chemical results using computer graphics: molecular rearrangements, art or science? ....See Entry 68759

31.20 SPECIFIC CALCULATIONS AND RESULTS

65856 Preliminary study of the linear muffin-tin orbital method. Zhang Kai-ming (Modern Phys. Inst., Fudan Univ., Shanghai, China), Wang Liang-sheng.
Acta Phys. Sin. (China), vol.32, no.1, p.57-63 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The linear Muffin-tin orbital method (LMTO) is studied. In applying this method to the calculations of some molecules, the parameters have been carefully chosen, the effects of the choice of parameters on the self-convergence and the final results have been investigated. Due to the limitation of the computer available, the calculations have been carried out only for diatomic molecules. The results obtained agree fairly well with experimental results. (16 refs.)

65857 Time-dependent Hartree-Fock theory and its multiconfiguration generalization. R.McWeeny (Istituto di Chimica Fisica, Univ. di Pisa, Pisa, Italy).
THEOCHEM (Netherlands), vol.10, p.1-14 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Recent progress in time-dependent Hartree-Fock (TDHF) theory is reviewed, with emphasis on new techniques and further generalizations. The formalism proposed by Moccia (1974) is sufficient to admit optimization of parameters of all kinds in a variational wavefunction determined by use of the Frenkel principle, the form of the reference function being arbitrary. Various approximations and methods of solution are discussed and an illustrative application, to the helium atom, is reported. (24 refs.)

65858 A theoretical investigation of the properties of free radicals. G.Leroy (Lab. de Chimie Quantique, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
THEOCHEM (Netherlands), vol.10, p.175-88 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Results of unrestricted Hartree-Fock calculations (at various basis set levels) are used for rationalizing static and dynamic properties of free radicals. A detailed classification of these species, based on their electronic structure and their stabilization energy, is presented. The latter concept is shown to be a good tool for analyzing the self-reactivity of free radicals. (22 refs.)

65859 Energy levels for a system of coupled oscillators. A.Requena, R.Pena (Phys. Chem. Dept., Murcia Univ., Murcia, Spain).
THEOCHEM (Netherlands), vol.10, p.221-6 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The authors formulate a self-consistent field description of coupled anharmonic oscillators including an hypervirial treatment of the matrix elements required to solve the SCF equations. The energy levels are calculated without the explicit knowledge of the wave-functions and the only information needed is the energy of the unperturbed states. A numerical application to two pairs of anharmonically coupled oscillators is made, and a system of three anharmonically coupled oscillators is solved. (13 refs.)

65860 Approximated eigenenergy for doubly perturbed oscillators. A.Requena, R.Pena (Phys. Chem. Dept., Murcia Univ., Murcia, Spain).
THEOCHEM (Netherlands), vol.10, p.227-30 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
By using both hypervirial and Hellmann-Feynman theorems, the energy levels for an anharmonic oscillator described by a potential of the type $w^2/2x^2+\lambda/4x^4+n/6x^6$ are calculated without the knowledge of the eigenfunctions. A comparison with the exact results is made including the Pade approximants to the perturbation series of the energy. (7 refs.)

65861 Ab initio molecular orbital calculations of the first two adiabatic ionizations of the water dimer. L.A.Curtiss (Chem. Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.442-6 (15 April 1983).
Ab initio molecular orbital methods have been used to study the first two adiabatic ionizations of the water dimer. Both ionizations cause considerable geometrical rearrangements in the water dimer structure. Good agreement is found with experiment on the difference between the vertical and adiabatic energies for the first ionization. (14 refs.)

65862 Ab initio valence-electron-only calculations on molecules: test application to NaCl. S.C.Leasure, T.P.Martin, G.G.Balint-Kurti (School of Chem., Bristol Univ., Bristol, England).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.447-52 (15 April 1983).
A new method for performing valence-electron calculations is applied for the first time to a molecular system. The method contains no adjustable parameters and in the limit of a large basis set converges on the all-electron frozen-core results. (18 refs.)

65863 Vibrational excitation following the S1s core ionization of CS. S.Canuto (Dept. de Fisica, Univ. Federal de Pernambuco, Recife, Brazil), L.M.Reyes.
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.591-4 (22 April 1983).
Ab initio non-relativistic spin-unrestricted Hartree-Fock calculations are performed on Cs and its S1s core-ionized state. Geometrical relaxation is investigated. As in the corresponding first-row CO, relaxation greatly influences the vibrational band profile. The one-particle vibrational picture leads to bond-length shortening whereas relaxation and direct calculations indicate a slight bond-length increase, leading to a predicted small vibrational broadening. (35 refs.)

65864 Theory of magnetic susceptibilities and NMR chemical shifts in terms of localized quantities. III. Application to hydrocarbons and other organic molecules. M.Schindler, W.Kutzelnigg (Lehrstuhl fur Theoretische Chem., Ruhr-Univ. Bochum, Bochum, Germany).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1360-70 (9 March 1983).
For pt.II see J. Chem. Phys., vol.76, p.1919 (1982). A method for the ab initio calculation of magnetic susceptibilities (χ) and chemical shifts (σ) based on individual gauge for localized orbitals (IGLO) is applied to a wealth of organic molecules. Calculations with a double-ζ basis are possible for molecules as large as Me_4Si or benzene and lead to acceptable results. For somewhat larger basis sets with polarization functions, good agreement with experiment is found. The anisotropies of χ and σ are also obtained satisfactorily. Both χ and σ are directly obtained as sums of contributions of the various localized orbitals that have a direct physical meaning. These contributions are to some extent transferable, which allows the construction of an ab initio increment system. (44 refs.)

65865 On the monotonicity of the atomic electron momentum density and shell structure of the radial momentum density. S.R.Gadre, S.Chakravorty (Dept. of Chem., Univ. of Poona, Pune, India), R.K.Pathak.
J. Chem. Phys. (USA), vol.78, no.7, p.4581-4 (1 April 1983).
Numerical investigations on the monotonicity of the electron momentum densities for atoms helium through xenon, using single-zeta and near Hartree-Fock wave functions, have been carried out. It has been noted that, in general, atoms with their ultimate *p* shells doubly occupied or more tend to show a nonmonotonic electron momentum density. An exception to this is the monotonic behavior exhibited by the elements helium through neon employing single-zeta wave functions. A study of the shell structure in momentum space for the above atoms reveals that all these atoms display, at the most, three maxima in their radial momentum density. (8 refs.)

65866 On the basis set superposition error in potential surface investigations. I. Hydrogen-bonded complexes with standard basis set functions. J.M.Leclercq, M.Allavena (Centre de Mecanique Ondulatoire Appl. CNRS, Paris, France), Y.Bouteiller.
J. Chem. Phys. (USA), vol.78, no.7, p.4606-11 (1 April 1983).
The basis set superposition errors on the energy of the complexes $FH...OH_2$ and FH...NCH are investigated at the SCF level. The two-dimension energy-potential surfaces, corresponding to the slow and fast frequencies of the hydrogen bridge, are calculated without and with the counterpoise correction. The corresponding quadratic, cubic, and quartic force constants are computed. Similar calculations are reported for the electric dipole moment and its derivatives. These investigations show that the basis set superposition error: (i) does not decrease, in the vicinity of the equilibrium configuration of the complex, when standard high-quality basis sets are used; (ii) shifts the minimum of the potential surface, distorts this surface, and changes the force constants in a significant but not drastic manner. (29 refs.)

65867 Isoelectronic changes in the Hartree-Fock properties of atoms. V.R.Babu, K.Gopalakrishna, K.D.Sen (School of Chem., Univ. of Hyderabad, Hyderabad, India).
J. Chem. Phys. (USA), vol.78, no.7, p.4779-80 (1 April 1983).
The systematic variation of the Hartree-Fock (HF) estimates of the nuclear electron attraction energy V_{ne}, electron-electron repulsion energy V_{ee}, and the total electronic energy E^{HF}, respectively within an isoelectronic series of atoms has been noted in the literature. Castro et al. (1981) have shown using the Z^{-1} perturbation expansion of E^{HF} that the second finite differences $-D^2$ in E^{HF} remain constant within an isoelectronic series. In addition, a constant increment of 0.25 in $-D^2$ in going from N to $N+1$ electron series has been noted by these authors. The systematics in $-D^2$ have been subsequently attributed to the variation in $\langle 1/r_1 \rangle$ within the series. The purpose of the communication is to report the result that the second differences in the eigenvalue sum $\Sigma \nu_i \epsilon_i$ within an isoelectronic series display exactly the same systematics as those observed in the case of E^{HF}. The authors' result follows from the Z^{-1} expansion of E^{HF}, V_{ne}, and V_{ee}. (10 refs.)

65868 Comment on ab initio calculation of spin densities in hydrocarbon radicals. D.M.Chipman (Radiation Lab., Univ. of Notre Dame, Notre Dame, IN, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4785-6 (1 April 1983).
Recently, the author reported calculations of hydrocarbon radical hyperfine coupling constants (HFC), using the spin-projected unrestricted Hartree-Fock (PUHF) method (1979). More recent research that has led to a much better understanding of the problem leads him to update the earlier study. The usual (unprojected) UHF model is formally closer to the much more soundly based single-excitation configuration interaction (SECI) model than is PUHF. Agreement with both SECI and experiment is much worse with UHF than PUHF. However, despite this much poorer absolute numerical agreement, the calculations indicate that the UHF model describes many HFC trends better than PUHF. (6 refs.)

65869 A comment on 'Numerical Hartree-Fock-Slater calculations on diatomic molecules' by A.D. Becke [and addendum]. B.I.Dunlap (Naval Res. Lab., Washington, DC, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4787-8 (1 April 1983).
Recently Becke (ibid., vol.76, p.6037, 1982) developed a quite promising, completely numerical approach for solving the Hartree-Fock-Slater (HFS) equations for diatomic molecules. Due to the variational properties of his methodology, he was able to explicitly demonstrate an accuracy of 0.1 eV in his calculation of the dissociation energies of diatomic molecules. The author's approach has similar variational properties to that of Becke but uses linear combination of Gaussian type orbitals (LCGTO) rather than numerical bases. However, in this approach, the problem of basis set incompleteness makes an estimate of the accuracy of dissociation energies less straightforward. Based on an analysis of similar Hartree-Fock calculations he conservatively estimated these dissociation energies to be accurate to 0.2 eV. Thus the results are apparently inconsistent; the worst discrepancy being 0.4 eV for N_2. In order to make a truly accurate comparison between the present numerical method and the LCGTO-$X\alpha$ method, Becke has carried out additional dissociation energy calculations. These new calculations are fully spin unrestricted, and the 1*s* core orbitals are no longer frozen. The resulting spin-unrestricted dissociation energies are presented. (5 refs.)

65870 Second and third derivatives of variational energy expressions: application to multiconfigurational self-consistent field wave functions. P.Pulay (Dept. of Chem., Univ. of Arkansas, Fayetteville, AR, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5043-51 (15 April 1983).
General analytical expressions are given for the second and third derivatives of constrained variational energy expressions. It is pointed out that variational energy expressions and odd-order derivatives have a distinct advantage over nonvariational (e.g., perturbative) energy expressions and even-order derivatives. In particular, the first-order wave function suffices to determine the derivatives of the variational energy up to third order. The coupled-perturbed multiconfigurational SCF (MC-SCF) equations, obtained from the general results, are equivalent, with minor corrections, to the ones very recently presented by Osamura, Yamaguchi, and Schaefer (1982). Explicit expressions are given for the second and third derivatives of the MC-SCF energy. Computational implementation is briefly discussed. (35 refs.)

65871 Accurate ab initio potential curves using bond functions. J.S.Wright, R.J.Williams (Ottawa-Carleton Inst. for Res. & Graduate Studies in Chem., Ottawa, Canada).
J. Chem. Phys. (USA), vol.78, no.8, p.5264-6 (15 April 1983).
The authors calculate the total binding energy and associated properties (such as vibrational energy levels) using small basis sets and modest configuration interaction for HF. A typical ab initio calculation auing Guassian orbitals on HF is considered in which a double-zeta plus polarization basis set is used. (14 refs.)

65872 Localized orbitals and the theory of separated pairs. W.L.Luken (Paul M. Gross Chem. Lab., Duke Univ., Durham, NC, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5729-32 (1 May 1983).
The relationship between the theory of separated pairs and localized molecular orbitals is examined by approximating the energy of a separated pair wave function as the sum of two terms. The first term determines a linear vector space similar to that spanned by the canonical SCF orbitals. The second term determines a basis for that space which corresponds to a localized representation of the wave function. (31 refs.)

65873 Ab initio studies of weakly bound complexes between some nonpolar molecules and hydrogen fluoride. A.M.Sapse (John Jay Coll., City Univ. of New York, New York, NY, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5733-7 (1 May 1983).
The complexes formed by nonpolar molecules and HF are studied with 6-31G, 6-31G*, 6-31G** Gaussian basis sets. Geometries and binding energies are determined and estimation of the correlation effects is provided using the Moller-Plesset perturbation theory (MP2). The binding energy dependence on the polarizability of the nonpolar molecules is discussed. (12 refs.)

65874 Ab initio studies of the CO_2-HF and N_2O-HF complexes. A.M.Sapse (John Jay Coll., City Univ. of New York, New York, NY, USA), J.M.Howell.
J. Chem. Phys. (USA), vol.78, no.9, p.5738-40 (1 May 1983).
Ab initio calculations are used to confirm the geometries found experimentally by Klemperer et al. (1981) for the CO_2-HF and N_2O-HF complexes. (10 refs.)

65875 On a molecular nuclear tunnelling effect involving more than a million basic vibrational wave functions. Theoretical study of bullvalene. P.Blaise (Dept. de Chimie, Univ. de Valenciennes et du Hainaut-Cambraisis, Valenciennes, France), R.Bouamrane, O.Henri-Rousseau, N.Merad, M.Nafi.
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.2, p.173-81 (Feb. 1983). In French.
Only some basis vibrational wave functions in the molecular nuclear tunnelling effects are generally observed. There is in bullvalene a nuclear tunnelling effect involving more than one million vibrational wave functions. The theoretical study of the effect leads the authors to consider the existence of a great number of vibrational energy bands. The determination of the band widths supposes the diagonalisation of a $(10!/3)\times(10!/3)$ hamiltonian matrix. This is performed by using the tensorial product properties. Then the experimental properties of bullvalene (geometry, spectroscopy and entropy) are studied in the light of the tunnelling effect. (15 refs.)

65876 Information on programs for quantum-chemical calculations of the electronic structure of molecular systems.
J. Struct. Chem. (USA), vol.23, no.3, p.472-83 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.170-80 (May-June 1982). [received: Feb. 1983]
In compliance with a resolution of the Coordinating Conference on Quantum Chemistry (Cherogolovka, 1981), the Center for Information on Programs for Quantum-Chemical Calculations (Institute of Organic Chemistry of the Academy of Sciences of the USSR, G.M. Zhidomirov) and the Specialized Reserve of Quantum-Chemical Programs, SRQP (SFKP) (Institute of Chemical Kinetics and Combustion, Siberian Branch, Academy of Sciences of the USSR, P.V. Schastnev) have prepared an information report on programs for quantum-chemical calculations of the electronic structure of molecular systems, available in various research centers. I.A. Abronin (Institute of Organic Chemistry of the Academy of Sciences of the USSR) and O.I Bel'chenko (Institute of Chemical Kinetics and Combustion, Siberian Branch, Academy of Sciences of the USSR) took part in the compilation of the information report. It is proposed in the future to publish periodically similar reports containing information on newly developed or appropriated programs, and also programs received in the SRQP. The information on the programs has been systematized in a single format, containing information on the holders of the program, the name of the program, its principal characteristics and its possibilities in algorithmic language. Information on programs for nonempirical calculations is given first, followed by programs in which the approximation of local exchange potential is realized (schemes of the X_α type), and finally by a summary of programs for semiempirical calculations. (no refs.)

65877 Molecular orbital theory of chain propagation in free-radical addition polymerization of vinyl monomers. Yu Tongyin, Yang Yuliang, Oi Nianhua, Sun Meng (Dept. of Chem., Fudan Univ., Shanghai, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1178-81 (Nov. 1982). [received: April 1983]
The process of chain propagation in free-radical polymerization of vinyl monomers, in a general sense, is the variation of the π-orbital of chain free-radical and monomer during transition. Hence, if it is possible to calculate the energy level of the π-orbitals at different stages, one can get the energy curve of the process, and thus correlate with the activation energy of addition polymerization. The authors by taking advantage of the molecular orbital theory proposed by Tang in 1975, and with the introduction of certain new assumptions, correlate the variation of the π-molecular orbital energy during the chain propagation in addition polymerization with the activation energy of chain propagation. (8 refs.)

65878 Quantum-chemical determination of additive bond polarizabilities in polyatomic molecules. S.G.Semenov, A.V.Tulub.
Opt. & Spectrosc. (USA), vol.53, no.3, p.245-8 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.415-20 (Sept. 1982). [received: May 1983]
A method has been proposed for calculating the additive bond polarizabilities in polyatomic molecules, based on the localization of the MO LCAO by the standard density matrix method. The chemical bonds of the molecule are regarded as its anisotropic structural units, characterized by characteristic polarizability tensors. The sum of these tensors gives the polarizability tensor of the molecule; i.e. the bond polarizabilities are additive. At the same time, their transferability is not assumed. To increase the accuracy of the calculations it is recommended that use be made of the SCF MO LCAO method with additional conditions ensuring agreement between the theoretical and experimental values of the molecular polarizabilities. The proposed formalism has been illustrated by calculations of the additive bond polarizabilities in the hydrogen cyanide and cyclohexane molecules. Quantum-chemical definitions of the dispersion components of the energy of interaction of large molecules and the energy of their adsorption on a crystal surface have been given in terms of the additive bond polarizabilities with allowance for many-particle van der Waals forces. (16 refs.)

65879 Investigations of some sulphur halides—an application of the pseudopotential method. T.Kruger, H.Preuss (Inst. fur Theoretische Chem., Univ. Stuttgart, Stuttgart, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.463-72 (April 1983).
Semilocal pseudopotentials are used in combination with a density-functional approximation for the correlation energy and special optimized basis sets to investigate the sulphur halides SF, SF_2, SF_3, FSSF, SSF_2, SCl, SCl_2, ClSSCl and $SSCl_2$. It turns out that the inclusion of d-orbitals in the basis set plays a significant role with respect to the quality of the calculated molecular parameters. Properties of SF_3 are calculated for the first time, and the differences between the disulphur difluorides and disulphur dichlorides are explained. (34 refs.)

65881 Search for a unique set of parameters in IOC-ω technique. K.B.Lal, V.K.Agrawal, A.K.Srivastava, B.Krishna (Chem. Dept., Univ. of Allahabad, Allahabad, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.994-5 (Dec. 1982). [received: April 1983]
A new set of parameters has been proposed in the framework of IOC-ω technique and the efficacy of the technique with the proposed set of parameters has been demonstrated by calculating the ionization potentials for alternant, non-alternant and heteromolecules. The values obtained compare favourably well with previously calculated values as well as experimental values wherever available. (24 refs.)

65882 Coordination in benzene dimer cation radical. S.A.Milosevich, K.Saichek, L.Hinchey, W.B.England, P.Kovacic (Dept. of Chem., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1088-90 (9 March 1983).
Ab initio MO calculations are used to characterize coordinations in benzene dimer cation. Binding occurs for all arrangements which allow π overlap between parallel rings. Parity (orbital symmetry) is approximately conserved, and two manifolds which correspond to opposite parities are predicted. Stable species in either manifold exhibit slippery, spongy bonds. In the odd (even) manifold, these are 1-coordinate-like (6-coordinate-like) dimers which are bound by $\sim$12(11) kcal/mol at inter-ring distances of $\sim$0.26(0.32) nm. Analysis of the results suggests that such parity manifolds are generally expected of alternant aromatic dimer cations, and also to some extent of their oxidomer analogues. (35 refs.)

65883 Approximation of frozen Xα orbitals in the theory of X-ray and electronic spectra. K.M.Neiman, A.V.Kondratenko, V.A.Nasluzov, L.V.Molchanova, P.V.Abramov (Inst. of Inorganic Chem., Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.349-54 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.30-6 (May-June 1982). [received: Feb. 1983]
The approximation of frozen orbitals for the calculation of X-ray and electronic spectra has been developed within the framework of the Xα method. The concept of the energy of occupied and unoccupied orbitals has been refined, and a definition of the energy of relaxation in this method has been given. The results of calculations for the Ar atom and the N_2, CO, SO_2, and SF_6 molecules have been given. (31 refs.)

65884 INDO-MO study of δ-CH acetyl-proton couplings in aliphatic α-acetoxy radicals. K.K.Karukstis, P.Smith (Dept. of Chem., Duke Univ., Durham, NC, USA).
J. Magn. Resonance (USA), vol.52, no.2, p.202-10 (April 1983).
Recent studies in the authors' laboratory have demonstrated a successful technique for determining preferred conformations in simple aliphatic α- and β-formyloxy radicals, $.C(X_1)(X_2)OCHO$ and $.C(X_1)(X_2)C(X_3)(X_4)OCHO$, respectively, using the results of extensive INDO-MO calculations and liquid-phase, experimental measurements of EPR long-range formyl-proton couplings in these species. The paper extends this type of study by way of an INDO investigation of a series of α-acetoxy radicals, namely, $.CH_2OC(O)CH_3$, $.CH(CH_3)OC(O)CH_3$, $.CH(CH_2CH_3)OC(O)CH_3$, $.CH(CH(CH_3)_2)OC(O)CH_3$, $.CH(CH_2OH)OC(O)CH_3$, $.CH(CH_2NH_2)OC(O)CH_3$, and $.C(CH_3)_2OC(O)CH_3$, for which experimentally determined EPR coupling-constant data are available, and confirms that the δ-CH acetyl-proton couplings observed experimentally can be sensitive probes of radical stereochemistry. Specifically, the study predicts and verifies that, for these radicals, the variations in the size of the experimentally determined δ-CH acetyl-proton coupling found to result from alterations in the nature of the substitution at the radical center arise from the accompanying changes in radical conformation. Furthermore, the preferred conformations of these α-acetoxy radicals found in the INDO investigation are in general

agreement with similarly determined conformations for structurally analogous .$C(X_1)(X_2)OCHO$ radicals. (22 refs.)

65886 Theoretical study of electrolytic ring opening of oxirane. Y.Jean, F.Volatron, Nguyen Trong Anh (Lab. de Chimie Theorique, Univ. de Paris-Sud, Orsay, France).
THEOCHEM (Netherlands), vol.10, p.167-73 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
SCF+CI calculations are performed to investigate the potential energy surface associated with the thermal C-C ring opening of oxirane (CH_2OCH_2). Contrarotatory, disrotatory and nonsynchronous processes are studied, and the results discussed with respect to experimental data (Huisgen and coll.) which indicate a loss of stereoselectivity in the ring opening reactions of some substituted oxirane molecules. (27 refs.)

65887 Nonempirical calculations of magnetic properties by the SOS-CI perturbation theory according to Nakatsuji. V.Galasso (Istituto di Chimica, Univ. di Trieste, Trieste, Italy).
THEOCHEM (Netherlands), vol.10, p.201-6 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
SOS-CI calculations at ab-initio level according to Nakatsuji's formalisms are presented for the nuclear spin-spin-coupling constants, magnetic shielding constants and diamagnetic susceptibilities for several simple compounds. The satisfactory results indicate that the SOS-CI formalism of Nakatsuji may be a practical alternative to the time-consuming CHF procedures in order to obtain reliable reproduction of second-order molecular magnetic properties. (7 refs.)

65888 Ab initio SCF CI study of the electronic structure and spectrum of CuF_2. S.Larsson, B.O.Roos (Dept. of Chem., Univ. of Lund, Lund, Sweden), E.M.Siegbahn.
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.436-41 (15 April 1983).
MC SCF and contracted CI calculations have been performed for the three ligand-field states of CuF_2 and also for two charge-transfer states. With the most extensive basis set the calculated d-d transition energies, including a Davidson correction for cluster effects, are 4150 cm^{-1} ($^2\Pi_g$) and 10560 cm^{-1} ($^2\Delta_g$). These calculations were made with 98 basis functions, including f orbitals on Cu and d orbitals on F. To check the charge distribution in the molecule, calculations of the ESR g factors were also made at the SCF and CI levels of approximation. Resulting CI values are $g_\parallel=1.93$ (1.91) and $g_\perp=2.76$ (2.60), with corresponding experimental numbers in parentheses. (20 refs.)

65889 Full CI extrapolation compared to explicit full CI for H_2O in a double-zeta basis. P.G.Burton, P.D.Gray (Chem. Dept., Univ. of Wollongong, Wollongong, NSW, Australia).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.453-7 (15 April 1983).
Successive *m*Main subspace MRD CI variational energies are shown to form the basis of an extrapolation of high precision to the corresponding exact full CI energy for H_2O in a double-zeta basis. While the highest *m*Main subspaces considered ($m=1, 3, 6, 11, 18, 26, 35$ and 45) involved only ≈5% of the full CI space of 256473 SAFs, the error due to extrapolation to the full CI result is only 0.21 kJ mol^{-1}, comparable to the precision to which the authors compute the CI energies (≈0.05 kJ mol^{-1}). (19 refs.)

65890 Accurate basis sets for atomic configuration interaction calculations. Ying Ming Poon (Dept. of Phys., Univ. of Hong Kong, Hong Kong).
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.113-16 (April 1983).
A Hartree-Fock-Slater program and a compatible box potential program are developed to generate complete basis sets for configuration interaction calculations using many-body perturbation theory. Examples are given for Pr^{3+} and Np^{3+} ions. Good orthogonality between basis functions is obtained even for large values of n and l. (10 refs.)

65891 Calculation of the fourth-order triple-excitation contribution to MB RSPT by using spatial symmetry properties of molecules. J.Noga (Dept. of Phys. Chem., Faculty of Sci., Comenius Univ., Bratislava, Czechoslovakia).
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.117-24 (April 1983).
A new algorithm is described for calculating the triple-excitation contribution to the fourth-order Many-Body Rayleigh-Schrodinger Perturbation Theory (MB RSPT). Exploitation of spatial symmetry properties of molecules is an inherent feature. Evaluation of zero intermediate values is eliminated from the calculation at the very outset of the program by a single numerical test of integrals. The algorithm is very efficient particularly in calculating electron correlation energies of symmetric molecules; but it can be applied successfully to calculate energies of arbitrary closed shell systems. It does not require much storage, since only a small fraction of the non-zero integrals must be held in core memory at the same time. Some examples of applications are appended. The method can be applied to calculate each contribution to MB RSPT. Program listing. (15 refs.)

65892 CASSCF/CI calculations for first row transition metal hydrides: The TiH($^4\Phi$), VH($^5\Delta$), CrH($^6\Sigma^+$), MnH($^7\Sigma^+$), FeH($^{4,6}\Delta$), and NiH($^2\Delta$) states. S.P.Walch, C.W.Bauschlicher,Jr. (Polyatomics Res. Inst., Mountain View, CA, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4597-605 (1 April 1983).
By consideration of atomic coupling arguments and interaction of $4s^23d^n$ and $4s^13d^{n+1}$ derived terms, the ground states of the transition metal hydrides are predicted to be TiH($^4\Phi$), VH($^5\Delta$), CrH($^6\Sigma^+$), MnH($^7\Sigma^+$), FeH($^4\Delta$), CoH($^3\Phi$), and NiH($^2\Delta$). All of these systems have been studied by a CASSCF/CI(SD) procedure with the exception of CoH. The calculated parameters derived from the CASSCF/CI(SD) potential curves are in good agreement with the experimental values where known (no information exists for TiH and VH). Inclusion of atomic correlation leads to significantly better agreement with experiment particularly for R_e. These improvements are related to a more balanced description of the atomic states in the correlated wave functions. (32 refs.)

65893 Interaction between two Co atoms. An all electron ab initio HF-CI investigation. I.Shim, K.A.Gingerich (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5639-8 (1 May 1983).
In the present work the authors present all electron ab initio Hartree-Fock (HF) and configuration interaction (CI) calculations of the 84 low-lying electronic states resulting from the interaction between two Co atoms in the $^4F(3d)^8(4s)^1$ term. The basis set used was of double zeta quality in general, but the $3d$ orbital was represented by a triple zeta function. The calculations were performed on the same degree of accuracy for all 84 states. The predicted $^5\Sigma_g{}^+$ ground state of the Co_2 molecue is due to the natural orbital occupation
$(3d\sigma_g)^{2.00}(3d\pi_u)^{3.09}(3d\delta_g)^{3.02}(3d\delta_u)^{2.98}(3d\pi_g)^{2.91}(3d\sigma_u)^{2.00}(4s\sigma_g)^{1.94}(4s\sigma_u)^{0.06}$.
From the calculated spectroscopic data of the Co_2 molecule, the authors have estimated the equilibrium distance to be 46 au and the vibrational frequency as 240 cm^{-1}. The chemical bond between the Co atoms is a single bond almost entirely due to the $4s\sigma_g$ molecular orbital. The 84 low-lying electronic states make a large contribution to the partition function, resulting in a lowering of the experimental dissociation energy of the Co_2 molecule. Reevaluating the data by Kant and Strauss resulted in an experimental dissociation energy $D_0{}^0$ of 22±6 kcal mol^{-1} or 93±25 kJ mol^{-1}. (20 refs.)

31.30 CORRECTIONS TO ELECTRONIC STRUCTURE

65894 Frequency-dependence of the nuclear electric shielding in the HF molecule via equation-of-motion-approaches. P.Lazzeretti, E.Rossi, R.Zanasi (Istituto di Chimica Organica, Modena, Italy).
THEOCHEM (Netherlands), vol.10, p.207-12 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Investigates the linear response of the hydrogen fluoride molecule in the ω range from zero up to the lower electronic resonance frequencies. An extended basis set of 72 contracted Gaussian functions has been prepared to build up LCAO-SCF molecular orbitals forming the quasivacuum $|\psi_{SCF}>$ ground state. The contraction scheme is (14s8p4d/8s3p1d)..> [9s6p4d/6s3p1d], which gives a near HF energy, −100.069661 hartree. The RPA equations have been solved within the first-order polarisation propagator approach. The authors note that the RPA is equivalent with the Coupled Hartree-Fock (CHF) or Time-Dependent Hartree-Fock (TDHF) approach. (12 refs.)

65895 On relativistic contributions to the bonding in Cu_2. R.L.Martin (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5840-2 (1 May 1983).
In a study of the Cu_2 dimer, Bauschlicher, Walch, and Siegbahn (BWS) (1982, 1983) found that after performing extensive valence-electron MCSCF calculations followed by configuration interaction including all single and double excitations from the MCSCF reference space, the computed bond length $4.35a_0$ remained roughly $0.15a_0$ longer than the experimental result. This discrepancy is approximately an order of magnitude larger than what one would expect from this level of theory based on experience with first-row diatomics. BWS pointed out that the error in r_e is about what one would expect for the relativistic bond contraction in Cu_2 given the atomic $4s$ orbital contraction ($0.065a_0$) obtained by Desclaux (1973). On the other hand, Pelissier (1981) has performed effective core potential perturbation theory calculations for Cu_2 which give $r_e=4.25a_0$, within $0.05a_0$ of experiment, and implying a quite small relativistic contraction. In order to avoid these indirect assessments of the importance of relativity, a direct evaluation of the dominant relativistic operators has been performed for Cu_2. (10 refs.)

65896 A comparison of different variants of the multi-configuration Dirac-Fock description of fine structure in light atoms. N.C.Pyper (Dept. of Theoretical Chem., Univ. of Cambridge, Cambridge, England).
J. Phys. B (GB), vol.16, no.8, p.L211-15 (28 April 1983).
Fine structure in light atoms is well described by the single-manifold extended average level (EAL) variant of relativistic multi-configuration Dirac-Fock (MCD) theory if the contribution from the Breit interaction is studied. The fine structure predicted by the optimal level (OL) variant is unreliable unless the corresponding result obtained by performing the OL calculation with an

artificially large value of the velocity of light is subtracted. Since, after this subtraction, the results differ little from the EAL predictions, it is concluded that it is not worthwhile to perform the series of calculations needed to predict reliable fine structure in the OL method. (23 refs.)

31.50 EXCITED STATES

65897 **Equilibrium geometry and dynamics of the valence excited states of 1,3-butadiene.** U.Dinur, R.J.Hemley, M.Karplus (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).
J. Phys. Chem. (USA), vol.87, no.6, p.924-32 (17 March 1983).
Franck-Condon factors are calculated for alternative forms of the potential energy surface of the $1^1B_u{}^+$ excited state of butadiene. A comparison of these results with the experimental absorption spectrum indicates that the $1^1B_u{}^+$ state of butadiene may have a nonplanar minimum, but that the twist around a terminal bond is no larger than 30°; for the $2^1Ag_g{}^-$ excited state larger distortions from planarity may occur. In treating the transition from a planar ground state to nonplanar excited states, it has been shown that a large number of modes and combination terms have significant Franck-Condon factors. The complex nature of the excited-state surfaces and the coupling between the $1^1B_u{}^+$ and $2^1A_g{}^-$ states are discussed and suggested as an explanation of some of the unusual photophysical properties of butadiene. (42 refs.)

65898 **Mesurement of photoionisation cross sections for the $7^2P_{3/2}$ and $6^2D_{3/2}$ excited states of caesium.** K.Gerwert, K.J.Kollath (Phys. Inst., Univ. Munster, Munster, Germany).
J. Phys. B (GB), vol.16, no.8, p.L217-21 (28 April 1983).
Relative photoionisation cross sections for the $7^2P_{3/2}$ and $6^2D_{3/2}$ excited states of caesium have been measured in the visible spectral range of the ionizing photon. The measurements have been performed using two pulsed dye lasers, pumped by the same excimer laser, for population of the excited states and for their photoionisation. The results for the $7^2P_{3/2}$ state show the theoretically expected smooth variation with wavelength, while the deep minimum predicted by theory for the $6^2D_{3/2}$ state has not been detected experimentally. (17 refs.)

65899 **The observation, identification and classification of resonances in Ne, Ar and Kr in the doubly excited states region.** H.W.Dassen, R.Gomez, G.C.King, J.W.McConkey (Dept. of Phys., Univ. of Windsor, Windsor, Ontario, Canada).
J. Phys. B (GB), vol.16, no.8, p.1481-501 (28 April 1983).
High-resolution metastable excitation function measurements have been made in the doubly excited states region for Ne, Ar and Kr targets. Comparison of the spectra obtained suggests that the gross features are due to negative-ion resonances. Previous techniques which have proved successful in the identification and classification of resonances in the rare gases at energies below the first ionisation threshold are applicable in this energy region also and assignments for a number of resonanees are suggested. Where appropriate, comparisons are made with data obtained by other techniques. The modified Rydberg formula has been used to predict energies for both doubly and triply excited configurations. (31 refs.)

65900 **Prolate-spheroidal semiempirical model for some monoexcited states Π_g and Δ_g of Na_2.** A.Alikacem, M.Aubert-Frecon (Lab. de Spectrometrie Ionique et Moleculaire, Univ. Lyon I, Villeurbanne, France).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.343-52 (Feb. 1983).
Values of the energy for the $nd\Pi_g$ ($n\in\{3, 39\}$) and $nd\Delta_g$ ($n\in\{3, 46\}$) Rydberg series of Na_2 were computed in a semiempirical way from multipolar expansions, the parameters of which were fitted from the experimental data of Carlson et al. (1981) corresponding to rather small values of n. The spherical multipolar expansion is found to be inadequate to describe Rydberg states of Na_2 while the prolate-spheroidal formalism is satisfactory. Results obtained from the spheroidal model for larger values of n are in fairly good agreement with the recent experimental data of Martin et al. (1982). (12 refs.)

65901 **Rydberg states with a $^2\Pi$ core: the $b^3\Pi_i$ and $C^2\Pi$ states of DCl.** K.P.Huber, F.Alberti (Herzberg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.387-404 (Feb. 1983).
The rotational structure in the lowest Rydberg complex of hydrogen chloride, $[X^2\Pi]4s\sigma$, was reinvestigated. The study is limited to the spectrum of $D^{35}Cl$, the HCl bands being too diffuse for a detailed analysis of second-order effects. The Λ-type doubling in both component states, $b^3\Pi$, and $C^1\Pi$, is small since it arises from the uncoupling of the core rather than Rydberg orbital angular momentum. It can be interpreted in terms of pure precession relations that are known to exist between the ground and first excited states of DCl^+. By contrast, the spin-orbit interactions, also originating in the core, are strong. In addition to distorting the triplet splitting in $b^3\Pi$, they lead to an avoided crossing between the nearly coinciding levels $b^3\Pi_0$ ($\nu=1$) and $C^1\Pi_1$ ($\nu=0$). They are also responsible for anomalies in the $b^3\Pi_0 \leftarrow X^1\Sigma^+$ R-branch intensities of DCl as well as of HBr, DBr, and HI. From the J values at the observed R-branch minima the authors have estimated the ratio $\mu_\parallel/\mu_\perp$ of the transition moments associated with the excitation of a $3p\sigma$ or $3p\pi$ core electron to the $4s\sigma$ Rydberg orbital of DCl and, correspondingly, of the other hydrogen halides. (22 refs.)

65902 **Formation and destruction of the $O_2(b^1\Sigma_g{}^+)$ metastable state in the positive column of a glow discharge in oxygen.** A.I.Maksimov, V.V.Rybkin.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.756-60 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.33-8 (July 1982). [received: March 1983]
Systematic measurements have been made of the metastable-molecule concentrations, and the formation and destruction mechanisms determined for various discharge parameters. Data is presented for $O_2(b^1\Sigma_g{}^+)$. The measurements were made in a discharge tube of molybdenum glass with electrodes in side arms. The radiation was recorded in the wavelength range 200-850 nm for the radiation emerging from the axial zone (diameter 2 mm) in the positive column PC from the end of the tube. (28 refs.)

65903 **Two-channel MODT analysis of bound $5snd^3D_{1/3}$ Rydberg states of strontium.** R.Beigang, D.Schmidt (Inst. fur Atom- und Festkorperphys., Freie Univ. Berlin, Berlin, Germany).
Phys. Scr. (Sweden), vol.27, no.3, p.172-4 (March 1983).
The $5snd$ $^3D_1$ and $^3D_3$ series of Sr are analysed by means of multichannel quantum defect theory for principal quantum numbers $n>12$. With a two-channel analysis using the $4d6s$ $^3D_1$ and $^3D_3$ character into the two $5snd$ $J=1$ and $J=3$ series is determined. (8 refs.)

65904 **Multichannel quantum defect analysis of the autoionized even-parity spectrum of neutral barium below the $5d^2D_{3/2}$ limit.** M.Aymar, P.Camus, A.El Himdy (Lab. Aime Cotton, CNRS II, Orsay, France).
Phys. Scr. (Sweden), vol.27, no.3, p.183-91 (March 1983).
Extensive new data on the even-parity autoionized spectrum of Ba has been provided by two-step optogalvanic spectroscopy. The spectral range below the $5d_{3/2}$ ionization limit presents a complicated scheme of interacting levels, which is analyzed using the multichannel quantum defect theory (MQDT). The analysis concerns the $5d_{3/2}n\ d$ and $5d_{3/2}ns$ series converging on the $5d_{3/2}$ limit and their perturbers belonging to $5d_{5/2}nd$ and $5d_{5/2}ns$ series converging on the higher $5d_{5/2}$ limit. This is a favourable case for MQDT since the number of perturbing levels is very large: for each $5d_{5/2}nl$ perturbing series, nine levels are located below the $5d_{3/2}$ limit. A J by J treatment of the energies of the spectra with J value ranging from 0 to 5 was carried out taking into account the $5dnd$-$5dns$ mixing. The analyses only concern the position of autoionized levels. In fact the $5dnl$ autoionized lines observed in this range are relatively narrow and one can neglect the coupling of $5dnl$ levels with $6s\epsilon l$ continua. The MQDT treatments presented here allow us to improve the identification of levels and to describe accurately the behaviour of perturbed series. (20 refs.)

65905 **A method for the determination of the inter-charge distance in the doubly-charged ions.** S.Cuna, C.Cuna (Inst. de Tehnol. Izotopica si Moleculara, Cluj-Napoca, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.34, no.10, p.982-5 (1982). In Rumanian.
The charge-separation reactions of the doubly charged ions can be detected from the metastable peaks resulting from the fragmentations occurring in the field-free regions of a double-focusing mass spectrometer. The coulombic energy gained on separating the charges from their distance in the activated complex to infinity will be $e^2/R=T$ or in common units $T(\mathrm{eV})=14.39/R(\text{Å})$. The calculated intercharge distance helps the authors to define the geometry of the transition state. (4 refs.)

31.70 EFFECTS OF MOLECULAR INTERACTIONS ON ELECTRONIC STRUCTURE

(see also 34. Atomic and molecular collision processes and interactions)

31.70D Environmental and solvent effects

65906 Bond orbital framework for rapid calculation of environmental effects on molecular potential surfaces. G.Naray-Szabo, P.R.Surjan (CHINOIN Pharmaceutical & Chem. Works, Budapest, Hungary).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.499-501 (15 April 1983).
A procedure is outlined to calculate rapidly potential surfaces of very large (bio)molecules. Using strictly localized orbitals as a basis set, the molecule is divided into a central part, treated at the SCF level, and the environment where the strictly localized character of the orbitals is maintained. Conformation of the active serine sidechain in α-chymotrypsin is discussed. (19 refs.)

65907 Solvent effect on the correlation between dipole increment and complexation enthalpy in charge transfer complexes. P.Huyskens, Ph.Mahillon, F.Kapuku (Dept. of Chem., Univ. of Leuven, Heverlee, Belgium).
J. Mol. Liq. (Netherlands), vol.25, no.1, p.13-24 (March 1983).
The dipole moments μ_{AB} and the complexation enthalpies $-\Delta H_{ab}$ of a series of complexes between iodine and substituted pyridines were determined in CCl_4 and in C_6H_6 at 298.16K. Within the limits of experimental errors the moments are the same in CCL_4 as in cyclohexane, whereas in benzene they are systematically larger by 0.48 ± 0.04 Debye. The transfer enthalpies of the complexes from cyclohexane towards CCl_4 are of the order of -5.9 ± 1.0 $kJmole^{-1}$ but reach $4\text{-}10.4 \pm 1.0$ $kJmole^{-1}$ from cyclohexane towards C_6H_6. A part of the stabilization is due to the increase of the dielectric constant. For benzene however the major part can be ascribed to specific interaction between the solvent molecules and the π-electrons of pyridine-iodine complexes. (15 refs.)

65908 A dielectric model for the solvent effect on the intensity of light absorption. T.Shibuya (Dept. of Chem., Shinshu Univ., Nagano, Japan).
J. Chem. Phys. (USA), vol.78, no.8, p.5175-82 (15 April 1983).
A new dielectric model is proposed for the solvent effect on the absorption intensity. The ratio of the apparent oscillator strength f'' of a solute molecule measured in a solution of refractive index n to the oscillator strength f of the solute molecule is given by $f''/f=[s(n^2-1)+1]^2/n$, where s is a 'shape' parameter of the cavity in which the solute molecule is supposed to lie. The parameter s is identified with the depolarization factor of a dielectric in the same shape as the cavity, for the direction of the transition moment. The proposed linear relation betwen $(nf'')^{1/2}$ and n^2-1 is demonstrated for the $\pi \rightarrow \pi^*$ transition of β-carotene and for the $n \rightarrow \pi^*$ transition of pyrazine. For the allowed $\pi \rightarrow \pi^*$ transitions of long linear polyenes, the s value is approximately 0, leading to the relation $f''/f=1/n$. The proposed formula also reduces to the well-known Chako formula $f''/f=(n^2+2)^2/(9n)$ for the spherical cavity whose s value is 1/3. The theory predicts that $1/n \leq f''/f \leq n^3$. It is shown that the proposed formulas are also derivable from Scholte's expressions (1949) of the cavity field and the reaction field for ellipsoidal cavity. (63 refs.)

65909 Dynamics of the spectra of solvating systems. L.D.Zusman, A.B.Gelman.
Opt. & Spectrosc. (USA), vol.53, no.3, p.248-52 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.421-8 (Sept. 1982). [received: May 1983]
A general quantum theory of the spectra of solvating systems, i.e. systems whose initial state is not an equilibrium state with respect to the polarization of the medium, is constructed. A general expression is obtained for the spectrum, expressed in terms of integrals of the complex permittivity of the solvent. It is shown that in the case of strong coupling with the medium, the spectrum evolves without change of form to its stationary situation, and the law of this evolution repeats the time dependence of the classical correlation function of the random process of the fluctuations in the medium polarization. 31.90 OTHER TOPICS IN THE THEORY OF ATOMS AND MOLECULES

(inc. properties other than energy)

65911 Electronic properties of alkali trimers. J.L.Martins (Inst. de Phys. Experimentale, Ecole Polytech. Federale, Lausanne, Switzerland), R.Car, J.Buttet.
J. Chem. Phys. (USA), vol.78, no.9, p.5646-55 (1 May 1983).
The electronic properties of the alkali trimers Li_3, Na_3, and K_3 are studied using the pseudopotential and the local-spin-density approximations. More than 100 configurations were calculated for each trimer in order to obtain a complete picture of the adiabatic Born-Oppenheimer surfaces. The equilibrium geometry of the trimers are Jahn-Teller distortions of an equilateral triangle. Although the three surfaces are quite similar, Li_3 is more affected than Na_3 or K_3 by the dynamical character of the Jahn-Teller distortion. The calculated ionization potentials agree very well with the experimental values and the qualitative features of the Born-Oppenheimer surface are confirmed by recent ESR experiments. (45 refs.)

32.00 ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

32.20 ATOMIC SPECTRA GROUPED BY WAVELENGTH RANGES

65912 On the 'giant resonance' in the 4d spectra of Ba, Ba^+ and Ba^{2+}. J.P.Connerade (Blackett Lab., Imperial Coll., London, England).
J. Phys. B (GB), vol.16, no.9, p.L257-62 (14 May 1983).
A new and detailed interpretation of the discrete structure in the Ba^{2+} spectrum based on a standard application of quantum defect theory (QDT) is presented, and the method is shown to yield realistic relative intensities in the discrete spectrum. It is argued that any collective oscillations are damped within one period and can give rise to no harmonics, while any ab initio theory capable of prediction the giant resonance in the continuum correctly is also suitable for the discrete structure. (12 refs.)

65913 Double excitation in the K absorption spectrum of neon. J.M.Esteva, B.Gauthe, P.Dhez, R.C.Karnatak (LURE, Univ. de Paris-Sud, Orsay, France).
J. Phys. B (GB), vol.16, no.9, p.L263-8 (14 May 1983).
The high resolution spectrum of gaseous neon in the 1s region was obtained by using synchrotron radiation. In addition to previously observed single-electron excitation lines, the authors observed two new sharp lines of comparable intensities in the continuum at 35.1 and 38.1 eV above the 1s→3p resonance line. On the basis of the known Ne 1s XPS shake-up lines the authors attribute them to transitions to $^1P^0$ levels of the $1s2s^22P^53p^2$ final-state configuration. (19 refs.)

65914 High Rydberg transitions in the principal and intercombination series of mercury. M.A.Baig (Phys. Inst., Univ. Bonn, Bonn, Germany).
J. Phys. B (GB), vol.16, no.9, p.1511-23 (14 May 1983).
The aborption spectrum of mercury vapour has been recorded at high resolution (± 0.003 Å) in the 1150-1350 Å region with synchrotron radiation as the background source of the continuum. Observations comprise the principal series: $6s^2\ ^1S_0 \rightarrow 6snp\ ^1P_1^0$ $(8<n \leq 37)$ and the intercombination series: $6s^2\ ^1S_0 \rightarrow 6snp\ ^3P_1^0$ $(8<n \leq 48)$. An intensity anomaly occurs at high n values with $^3P_1^0$ gaining most of the oscillator strength at the expense of the $^1P_1^0$ transitions. Simple intermediate coupling calculations show that this is due to a change from *LS* to *jj* coupling with increasing n values. A two-dimensional Lu-Fano plot it is also presented and this exhibits interchannel interactions between the $^1P_1^0$ channels. As a result of the new measurements, the previously somewhat uncertain determination of the first ionisation potential is reliably confirmed as 84184.10 ± 0.20 cm^{-1}. (36 refs.)

65915 S II and S III branching ratios in the 600- to 1200-Å interval. M.D.Morrison, A.J.Cunningham (Center for Space Sci., Univ. of Texas, Richardson, TX, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3233-6 (1 April 1983).
Branching ratios of singly and doubly ionized sulfur EUV emissions are presented. The S II transitions originated from the ^2P, $4s'\ ^2D$, and $4s\ ^2P$ terms and terminated on the metastable states of the ion. The S III transitions originated from the $3d\ ^3D^0$, $4s\ ^3P^0$, $3p^3\ ^3S^0$, $4s\ ^1P^0$, and $3s3p^3\ ^1P^0$ terms and terminated on the metastable and ground ionic states. The results for S III include branching ratios involving intercombination transition which impact ongoing modeling of the energy budget of the Io plasma torus. (16 refs.)

65916 The quartet system of Li I. S.Mannervik, H.Cederquist (Res. Inst. of Phys., Stockholm, Sweden).
Phys. Scr. (Sweden), vol.27, no.3, p.175-82 (March 1983).
The doubly-excited system of quartets in Li I have been studied by the beam-foil technique using optical detection in the VUV. The absolute term value of the lowester quartet $1s2s2p\ ^4P^0$ has been determined to be 57.4113 ± 0.0006 eV which is much more accurate than earlier experimental results. The authors have also made the first experimental determination of the term energy of the $1s2p3p\ ^4P$ state by observing its decay to the $1s2s2p\ ^4P^0$ state by emission of a spectral line at 1680.2 Å. In addition, eight new observations of quartet transitions are reported as well as some lifetimes. The most recent experimental results are summarized and compared to calculations. (62 refs.)

65917 Transitions in multiply excited F VI and F VII. I.Martinson, B.Denne, J.O.Ekberg, L.Engstrom, S.Huldt, C.Jupen, U.Litzen (Dept. of Phys., Univ. of Lund, Lund, Sweden), S.Mannervik, A.Trigueiros.
Phys. Scr. (Sweden), vol.27, no.3, p.201-6 (March 1983).
The transitions $1s2s2p^2\ ^5P$-$1s2p^{3 5}S^0$ in F VI and $1s2s2p^4P^0$-$1s2p^2\ ^4P$ in F VII have been investigated using the method of beam-foil spectroscopy. The fine-structure separations have been determined for the $1s2s2p^2\ ^5P$ term in F VI and for both ^4P terms in F VII. The results are compared with recent theoretical calculations of fine structure, based on relativistic wavefunctions, and with previous experimental data. Lifetime measurements are reported for the $1s2p^2\ ^4P_{5/2}$ level and $1s2p^3\ ^5S_2{}^0$ level. (35 refs.)

32.50 FLUORESCENCE, PHOSPHORESCENCE

(inc. quenching)

65918 Theoretical lifetimes, X-ray transition energies and fluorescence yields for double K vacancy configurations of multiply-ionized fluorine. C.Can, C.P.Bhalla (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1090-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Theoretical X-ray transition energies, lifetimes, partial multiplet fluorescence yields and average fluorescence yields have been calculated for various fluorine ions with a double K-shell vacancy. (4 refs.)

65919 Theoretical X-ray transition energies and fluorescence yields for multiply-ionized oxygen. C.P.Bhalla (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1097-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Theoretical X-ray transition energies and multiplet partial fluorescence yields are presented for various oxygen ions with a single K-shell vacancy. (3 refs.)

65920 Separation of time-averaged turbulence components by laser-induced fluorescence. S.Cheng, M.Zimmermann, R.B.Miles (Dept. of Mech. & Aerospace Engng., Princeton Univ., Princeton, NJ, USA).
Phys. Fluids (USA), vol.26, no.4, p.874-7 (April 1983).
Turbulence is measured by resonant fluorescence of sodium atoms seeded into a supersonic nitrogen jet. By varying the frequency of the pumping laser, the mean square velocity, temperature, and pressure fluctuations (as well as their correlations) may be determined. (10 refs.)

32.60 ZEEMAN AND STARK EFFECTS

65921 Stark shift trends in homologous ions. I.S.Lakicevic (Inst. of Phys., Belgrade, Yugoslavia), J.Puric.
J. Phys. B (GB), vol.16, no.9, p.1525-30 (14 May 1983).
The Stark shifts of Pb II, P II, Sn II and Sb II non-resonance lines have been measured in an electromagnetic T-tube plasma. The electron temperature was varied in a range from 16000 to 20000K and the electron number density from 0.3×10^{23} to 1.4×10^{23} m^{-3}. On the basis of the some established Stark shift regularities and systematic trends, predictions for the same lines were made. The experimental data and complete data set obtained in this way were used to demonstrate the existence of the other types of common regularities for the lines originating from the same type of transition. (10 refs.)

65922 Complex scaling of AC Stark Hamiltonians. J.S.Howland (Dept. of Math., Univ. of Virginia, Charlottesville, VA, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1240-4 (May 1983).
For a two-body atom in a temporally periodic, spatially uniform field, it is shown that in an appropriate gauge the essential spectrum of the Floquet Hamiltonian rotates about a certain set of thresholds when subjected to a complex scaling transformation. (7 refs.)

65923 Observation and quasistatic analysis of structure in microwave ionization of highly excited helium atoms. D.R.Mariani (J.W. Gibbs Lab., Yale Univ., New Haven, CT, USA), W.van de Water, P.M.Koch, T.Bergeman.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1261-4 (25 April 1983).
The ionization of He$[1s(n \simeq 30)s]^3S_1$ atoms by an oscillating electric field (9.92 GHz) is strongly dependent on the field amplitude. The ionization curves reveal structures which are absent in those for H($n \simeq 30$) atoms. The ionization rate does not increase monotonically near threshold and is approximately constant over one or more regions of higher field. A quasistatic model is considered which relates the structure in the ionization curves of He to the occurrence of anticrossings in He Stark states. (16 refs.)

32.70 SPECTRAL LINE SHAPES AND INTENSITIES

65924 Comprehensive theory for line broadening in high-resolution and nonlinear spectroscopies: application to the Na D lines. R.M.Herman, E.W.Weber (Phys. Inst. der Univ. Heidelberg, Heidelberg, Germany).
J. Phys. B (GB), vol.16, no.8, p.1323-41 (28 April 1983).
A general method for analysing line broadening caused by Doppler, phase-shift, inelastic and velocity-changing collisional effects is proposed for transitions at optical wavelengths. In a unified approach Poisson statistics are used to describe collision probabilities randomly distributed in a time interval which can terminate the optical coherence in a combination of the above effects; markoffian independence is assumed for each collision. Then the dipole moment correlation function is obtained in a form which is virtually exact in accounting for all effects of isotropic forces, and which is correct to second-order terms in the anisotropic interaction potentials. Phenomena as diverse as standard optical pressure broadening, broadening due to velocity-changing collisions in nonlinear spectroscopies, and Dicke narrowing of the Doppler contour are described. The implications of the theory are discussed in detail and applied to the case of the NaD lines perturbed by He buffer gas. Numerical calculations reveal that the substantially different lineshift and broadening parameters in nonlinear and in standard optical spectroscopies can be reasonably well understood within the limitations posed by present uncertainties in the Na 3^2P-He interaction potentials. However, the large differences in shift and width between the D$_2$ and D$_1$ lines in saturation spectroscopy cannot be explained within the present theory. (34 refs.)

65925 Effects of radiative decay on electron-ion cross sections below and above an excitation threshold. H.van Regemorter (Obs. de Paris-Meudon, Meudon, France).
J. Phys. B (GB), vol.16, no.9, p.L289-94 (14 May 1983).
When radiative decay competes with autoionisation, below an excitation threshold, the resonance contribution to excitation in highly-charged ions can be considerably reduced. Just above threshold, radiative decay of the ion may also occur before excitation, and the excitation cross section is reduced. The importance of this effect is studied in the case of resonance transitions in helium-like ions. (8 refs.)

65926 Moderately accurate oscillator strengths from NBS intensities. II. C.R.Cowley (Dept. of Astron., Univ. of Michigan, Ann Arbor, MI, USA), C.H.Corliss.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.651-9 (May 1983).
For pt.I see ibid., vol.202, no.2, p.417-25 (1983). Cowley (1983) explored the calibration of NBS Monograph 145 intensity measurements for the purpose of obtaining useful oscillator strengths. The authors investigate the question of a single 'temperature' for the copper arc light sources. Statistical arguments support rejection of the null hypothesis of a single temperature. Evidence is found for a mild correction to the intensity scale, but there is no indication that the intensities drift with wavelength. The authors reinforce earlier findings that very useful *gf*-values can be derived from Monograph 145 intensities for any spectrum in which there are enough accurate measurements for a calibration. A table lists interpolation coefficients for Fe I, Co I, Ni I, Ti I, Zr II, Y II, Nd II and U II. An improved formula is given to transform the Corliss-Tech (1968) Fe I oscillator strengths to the Oxford system. (29 refs.)

65927 Iodine configurations $5p^4ns$, $5p^4np$ (n=6,7). Radiative transition probabilities, radiative lifetimes. A.V.Loginov, P.Z.Gruzdev.
Opt. & Spectrosc. (USA), vol.53, no.3, p.237-9 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.400-4 (Sept. 1982). [received: May 1983]
Values of the $5p^4np$-$5p^4ns$ and $5p^4ns$-$5p^5$ transition probabilities and the radiative lifetimes for the $5p^4ns$ and $5p^4np$ (n=6, 7) levels for the iodine atom are obtained in the intermediate-coupling scheme with electrostatic, spin-orbit, and effective interactions taken into account. (12 refs.)

65928 Determination of radiative lifetimes of lower resonance states for atoms of the copper subgroup (Cu I, Ag I, Au I). N.N.Bezuglov, V.N.Gorshkov, A.L.Osherovich, G.L.Phekhotkina.
Opt. & Spectrosc. (USA), vol.53, no.3, p.239-42 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.405-10 (Sept. 1982). [received: May 1983]
The lifetimes of six lower resonance levels of Cu I, Ag I, and Au I are measured with the proper correction for the effect of radiation capture in the finite volume of the directed beam. The results are compared with the radiative lifetimes under conditions of almost complete absence of radiation capture. (14 refs.)

65929 Probabilities for transitions between levels of two-electron ions in a constant electric field. G.L.Klimchitskaya, M.E.Konyzhev.

Opt. & Spectrosc. (USA), vol.53, no.3, p.318-19 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.541-3 (Sept. 1982). [received: May 1983]

The authors are interested in the effect of a uniform constant electric field on the transition probabilities in multiply charged two-electron ions. The Coulomb interaction of the electrons mixes states with different values of $j_1l_1j_2l_2$, while the interaction with the external field mixes states with different values of J. In calculation of the mixing coefficients it is sufficient to consider only the Coulomb interaction of the electrons. External fields are considered for which the energy of the electron-field interaction can be large in comparison with the energy of the electron-electron interaction but still much smaller than the binding energy in a multiply charged ion. (12 refs.)

65930 Probabilities for electric quadrupole transitions between Rydberg states of atoms and ions. V.A.Davydkin, A.Yu.Makerenko.

Opt. & Spectrosc. (USA), vol.53, no.3, p.327-8 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.553-7 (Sept. 1982). [received: May 1983]

The semiclassical approximation in the quantum defect method (the WKBJ-QD approximation) is used to derive analytic expressions for the probabilities for electric quadrupole transitions between highly excited Rydberg states of atoms and ions. (5 refs.)

32.80 PHOTON INTERACTIONS WITH ATOMS

65931 Recent developments in photoelectron dynamics using synchrotron radiation. T.A.Carlson, M.O.Krause (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), J.W.Taylor, P.R.Keller, M.N.Piancastelli, F.A.Grimm, T.A.Whitley.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1034-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Through a collaborative effort of members of the Oak Ridge National Laboratory and Universities of Wisconsin and Tennessee, a comprehensive study of atoms and molecules using angle-resolved photoelectron spectroscopy and synchrotron radiation is underway at the Synchrotron Radiation Center, Stoughton, Wisconsin. Over 50 molecules and atoms have been investigated. These results, coupled with theory, aim at a better understanding of the dynamics of photoionization and of the wave functions that control these processes. In particular, attention is given to the following topics: metal atomic vapors, generalization of molecular orbital types, autoionization, shape resonances, core shell effects, satellite structure and the Cooper minimum. (33 refs.)

65932 Overlap of He atom and He$^+$ ground-state wave functions and calculation of ionization potential. K.Dawson, N.H.March (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England).

Phys. Lett. A (Netherlands), vol.94A, no.9, p.434-6 (4 April 1983).

The one-body equation proposed earlier (see March, ibid., vol.84, p.319, 1981) for determining the overlap of He atom and He$^+$ wave functions can be given a fundamental justification. This equation with an approximate form of one-body potential can be solved, and an excellent ionization potential results. The helium atom ground-state wave function can thereby be refined. (6 refs.)

32.80D Autoionization

65933 Theoretical autoionisation rates of the 1s2p^2 ^{2}D and 1s2s2p ^{2}P^0 states of Li. C.A.Nicolaides, G.Aspromallis (Theoretical & Phys. Chem. Inst., Nat. Hellenic Res. Found., Athens, Greece).

J. Phys. B (GB), vol.16, no.9, p.L251-5 (14 May 1983).

By applying a many-electron approach to the calculation of autoionising states, which takes electron correlation and non-orthonormality into account, the authors have obtained the autoionisation rates of the Li 1s2p^2 ^{2}D and [1s(2s2p) ^{3}P^0] ^{2}P^0 states as 15.2×10^{12} s^{-1} for ^{2}D and 5.2×10^{12} s^{-1} for ^{2}P^0. Contrary to previous theory, these results agree with the recent experimental values of Cederquist and Mannervik (1982) which are $15.8\pm0.4\times10^{12}$ s^{-1} for ^{2}D and $4.0\pm0.2\times10^{12}$ s^{-1} for ^{2}P^0. (18 refs.)

32.80F Photoionization and photodetachment

65934 A multichannel theory of inverse two-electron recombination. Li Jia-ming (Inst. of Phys., Acad. Sinica, Peking, China).

Acta Phys. Sin. (China), vol.32, no.1, p.84-91 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*

The author proposes a multichannel theory on inverse two-electron recombination processes (i.e., inverse resonance radiative-recombination processes). As a specific example, he analyzes the recent high-resolution laser spectroscopic measurements on excited barium atoms by Safinya and Gallagher (1979), illustrating that accurate experimental spectroscopic data can be utilized to assess the accuracy of theoretical calculations on inverse two-electron recombinations. Through the detailed balance relation, it is equivalent to assess the accuracy of theoretical calculations on two-electron recombination processes—this will be a more basic test on theoretical results for each appropriate symmetric block in partial-wave expansions. (20 refs.)

65935 He$^-$ photodetachment: effects of the 1s2p2p$'^4$P^e resonance. J.R.Peterson, M.J.Coggiola, Y.K.Bae (SRI Internat., Menlo Park, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1043-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

He$^-$ exists in a metastable state, (1s2s2p)^{4}P^o, lying 19.74 eV above He(1^{1}S), with substate lifetimes of 10-500 μs. Following a preliminary survey of the photodetachment cross section over a range of energies, the authors have concentrated on a large shape resonance associated with the first excited state of He$^-$, 1s2p2p$'$ ^{4}P^e, which recent calculations have found to lie just above He(2^{3}P). The resonance has a profound effect on the overall photodetachment spectrum. (13 refs.)

65936 Observation of Kr and Xe ions created by intense nanosecond CO$_2$ laser pulses. S.L.Chin, Gy.Farkas, F.Yergeau (Dept. de Phys., Faculte des Sci. et de Genie, Univ. Laval, Laval, Quebec, Canada).

J. Phys. B (GB), vol.16, no.8, p.L223-6 (28 April 1983).

The authors observe that very intense nanosecond CO$_2$ laser pulses ($h\nu=0.117$ eV) do ionise Kr and Xe atoms directly. (4 refs.)

65937 Resonant multiphoton ionisation and third-harmonic generation in mercury vapour. D.Normand, J.Morellec, J.Reif (CENS, Service de Phys. des Atomes et des Surfaces, Gif-sur-Yvette, France).

J. Phys. B (GB), vol.16, no.8, p.L227-32 (28 April 1983).

The interaction of intense dye laser radiation (up to about 100 GW cm^{-2}) with Hg vapour in the pressure region of 10^{15} to 10^{-1} Torr leads to competition between multiphoton ionisation—dominant at low pressure—and third-harmonic generation ($\sim$1850Å) prevailing at high pressure. In particular, third-harmonic generation enhanced by a four-photon resonance is—to the authors' knowledge—reported for the first time. (9 refs.)

65938 Multiply charged ions induced by multiphoton absorption processes in rare-gas atoms at 1.064 μm. A.L'Huillier, L.A.Lompre, G.Mainfray, C.Manus (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).

J. Phys. B (GB), vol.16, no.8, p.1363-81 (28 April 1983).

Multiply charged ions are easily formed in rare gases by multiphoton absorption processes. For Kr and Xe up to quadruply charged ions are formed. They are induced by a bandwidth-limited 50 ps laser pulse at 1.064 W cm^{-2} intensity range. Doubly charged ions are formed through the absorption of a very large number of photons (29 for Xe) in a direct transition from the ground state of the atom to the second ionisation limit. The percentage of Xe^{2+} ions relative to Xe$^+$ ions is 1% at 10^{13} W cm^{-2}, and reaches 20% at 10^{14} W cm^{-2}. At 1.06 μm, the removal of two electrons from the ground state of rare-gas atoms in a single step is responsible for the creation of doubly charged ions. This could be a general rule for atoms which have two or more electrons in the outer shell. (23 refs.)

65939 Calculation of photoionisation cross sections, resonance structure and angular distribution for Mn I by many-body perturbation theory. L.J.Garvin, E.R.Brown, S.L.Carter, H.P.Kelly (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).

J. Phys. B (GB), vol.16, no.9, p.L269-74 (14 May 1983).

Photoionisation cross sections for the 4s, 3d and 3p subshells and the 3d angular distribution have been calculated for atomic Mn by many-body perturbation theory. Spin-orbit effects in the 3p$\rightarrow$3d resonance and resonances due to 3p$\rightarrow$$ns,nd$ ($n>3$) excitations have been computed. Comparison is made with recent experiments. (20 refs.)

65940 Stochastic ionization of excited atomic hydrogen in an electromagnetic-wave field. D.L.Shepelyanskii.

Opt. & Spectrosc. (USA), vol.53, no.2, p.208-9 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.354-6 (Aug. 1982). [received: April 1983]

Conditions are obtained under which stochastic ionization from low-excited states with $n\gtrsim2$ can occur. The condition for the diffusion excitation of atoms is determined by the classical stochasticity limit as well as by the quantum stability limit and is not related with the width $\Delta\omega$ of the electromagnetic radiation spectrum (under the condition that $\Delta\omega\ll\Omega=n^{-3}$). In fact, it follows from the classical discussion, applicable to highly excited levels, that when nonlinear resonances do not overlap and $\Delta\omega\ll\Omega$ the diffusion excitation rate turns out to be exponentially small with respect to the adiabaticity parameter $\Delta\omega/\Omega$. (15 refs.)

32.80H Auger effect and inner-shell ionization

65941 Ar L-MM Auger spectra in Ar^{3+}+Ar collisions. T.Matsuo, J.Urakawa, A.Yagishita, Y.Awaya, T.Kambara, M.Kase, H.Kumagai (Inst. of Phys. & Chem. Res., Saitama, Japan).

J. Phys. B (GB), vol.16, no.8, p.L239-42 (28 April 1983).

Energy distributions of electrons ejected in Ar^{3+}+Ar collisions were measured at collision energies of 4.3 and 6.6 MeV. The L-MM Auger peaks from the targets were distributed through 100 to 200 eV. The isolated peaks located at about 101 eV were observed for the first time; they were attributed to the L$_{23}$-M$_1$M$_2$ Auger electrons from the target Ar ions which have six vacancies in the M$_{23}$ shell. (4 refs.)

65942 N$_{4,5}$N$_{6,7}$X Coster-Kronig spectra of free Hg atoms. H.Aksela, S.Aksela (Dept. of Phys., Univ. of Oulu, Oulu, Finland).

J. Phys. B (GB), vol.16, no.9, p.1531-41 (14 May 1983).

The N$_{4,5}$N$_{6,7}$X (X=N$_{6,7}$, O$_{2,3}$, O$_{4,5}$) Coster-Kronig-type Auger spectra of free mercury atoms have been measured and analysed by comparing the experimental results with the calculated profiles. The spectra have been measured with the use of electron beam excitation. The kinetic energies of the Auger lines have been calculated by the ΔSCF method using a relativistic Dirac-Fock program. The relative energies of the line components have also been computed non-relativistically and a comparison has been made between the non-relativistic and the relativistic results. The intensities of the lines have been calculated in the mixed coupling scheme applying *jj* coupling to the initial states and intermediate coupling to the final states. The calculated profile reproduces the fine structure in the experimental spectrum rather well. The experimental intensity ratios between different line groups are between the experimental results of Matthew et al. (1980) and Larkins et al. (1977) for solid Au, and in obvious discrepancy with the calculated group intensity ratios based on McGuire's results (1974). (17 refs.)

33.00 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS

65943 On the time variable in the description of molecular systems: from molecular transients to biomolecules. J.Durup (Univ. Paris-Sud, Orsay, France).
Comments At. & Mol. Phys. (GB), vol.12, no.5-6, p.255-76 (1983).
It is argued that the observation of very fast (subnanosecond) evolution processes in excited molecules should be more precise in energy-resolved rather than in time-resolved experiments. However, time representations are very useful for a comprehensive description especially of complex phenomena, and they always are present in mind in the case of systems where branching between competitive pathways occur. Therefore, explicit formulations of time evolution of the wavefunction of such systems are recalled. It is shown that in some cases a semiclassical representation in terms of the 'eigentime' of the excited molecule, using a function analogous to a Wigner function, yields the correct result. This kind of representation is further used for defining a characteristic time for dissociation processes, which is in turn compared with its classical counterpart. Finally, it is described how competition between relaxation and reaction in transient enzyme-substrate complexes may lead to unusual time patterns which were shown by Ninio to be of major importance in biochemical selectivity. (15 refs.)

33.10 CALCULATION OF MOLECULAR SPECTRA

65944 Rotational analysis and deperturbation of the $C^2\Sigma^+$-$X^2\Sigma^+$ band systems of BeH and BeD. R.Colin, C.Dreze, M.Steinhauer (Lab. de Chimie Phys. Moleculaire, Univ. Libre de Bruxelles, Brussels, Belgium).
Can. J. Phys. (Canada), vol.61, no.4, p.641-55 (April 1983).
A new $C^2\Sigma^+$-$X^2\Sigma^+$ transition of BeH and BeD is observed in a beryllium arc in hydrogen or deuterium gas mixed with argon. The rotational analysis of the most intense of these strongly red degraded bands, which involve $v'=0$-2 for BeH and $v'=0$ for BeD, allows one to derive molecular constants for the new $C^2\Sigma^+$ state. The latter has a large internuclear equilibrium distance ($r_e=2.301$ Å) and a shallow potential energy minimum ($D_e'=8452\pm100$ cm^{-1}). The principal molecular constants are given. The *C-X* bands analyzed involve the higher vibrational levels of the $X^2\Sigma^+$ state and allow, therefore, a substantial improvement of the ground state molecular constants to be made and a good Rydberg-Klein-Rees (RKR) potential energy curve to be calculated. The limiting curve of the predissociation confirms the previous value of the dissociation energy ($D_e''=17426\pm100$ cm^{-1}) and indicates that a small maximum, less than 200 cm^{-1}, could exist at $r\simeq3.3$ Å in the ground state potential energy curve. Franck-Condon factors for the $C^2\Sigma^+$-$X^2\Sigma^+$ bands of BeH and BeD are also calculated. (18 refs.)

65945 Anomalous rotational state distribution for the O_2 photofragment in the UV photodissoication of ozone. J.J.Valentini (Chem. Div., Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.395-8 (15 April 1983).
The coherent anti-Stokes Raman scattering (CARS) spectrum of $O_2(^1\Delta_g)$ formed in the photodissociation of ozone at 266 nm is presented. An anomalous propensity for even ($J=2,4,6,\ldots$) rotational states is observed. This propensity effect is discussed in terms of symmetry restrictions and dynamical bias in the photolysis. (10 refs.)

65946 Measurement of the fragment kinetic energy distribution in laser photopredissociation of N_2O^+. J.Lerme, S.Abed, R.A.Holt, M.Larzilliere, M.Carre (Lab. de Spectrometrie Ionique et Moleculaire, Univ. Lyon I, Villeurbanne, France).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.403-6 (15 April 1983).
Using an electrostatic energy analyzer together with a fast-ion-beam laser spectrometer, the authors have measured the kinetic energy spectrum of NO^+ ions produced in the slow predissociation of N_2O^+ prepared in specific vibrational and rotational levels of the Ã excited electronic state. For either the $\tilde{A}^2\Sigma^+(100)$ or $\tilde{A}^2\Pi(b)(110)$ states the resulting distribution is remarkably narrow, with almost all of the NO^+ ions produced in the $v''=4$ vibrational level. (24 refs.)

65947 Direct observation of molecular rotation-translation coupling by far-infrared spectroscopy. G.J.Evans, M.W.Evans (Edward Davies Chem. Labs., Univ. Coll. of Wales, Aberystwyth, Wales).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.416-18 (15 April 1983).
The differences between the far-infrared absorption of liquid (+) 3-methylcyclohexanone and the racemic mixture are interpreted as supporting evidence for the direct observation of rotation-translation coupling. (9 refs.)

65948 Uniform semiclassical self-consistent-field calculations of vibrational resonance energies and widths. D.Farrelly, R.M.Hedges,Jr., W.P.Reinhardt (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.599-603 (22 April 1983).
Using the Breit-Wigner definition of a resonance, the authors calculate both resonance positions and widths for a model nonseparable hamiltonian, using a uniform semiclassical self-consistent-field (SCF) method. Excellent agreement with recent complex-coordinate quantum SCF calculations is obtained. (28 refs.)

65949 Substituted benzenes. IV. Normal coordinate analysis of mono iodonitrobenzenes. P.Muralidhar Rao, G.Ramana Rao (Dept. of Phys., Univ. Coll., Kakatiya, Warangal, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.949-53 (Dec. 1982). [received: April 1983]
Ortho-, meta- and para-iodonitrobenzenes are subjected to normal coordinate analysis using a 36-parameter modifed valence force field for the in-plane vibrations. The force constants are refined by the method of least-squares employing the vibrational frequencies of the three molecules. The potential energy distributions are computed in internal force constants and used to classify the normal vibrations on a quantitative basis. The nature of the absorption bands is examined in relation to the mixing of the vibrational modes and revised assignments are suggested in some cases. (19 refs.)

65950 Vibrational analysis of uranyl tetrachloride complexes. A.Natarajan, S.Somasundaram (Dept. of Phys., Autonomous PG Centre, Tiruchirapalli, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.784-6 (Oct. 1982). [received: April 1983]
A normal coordinate analysis of some metallic uranyl tetrachloride complexes $M_2UO_2Cl_4$(M=K, Rb, Cs and NH_4) has been made, neglecting the outer M^+ ions, on the basis of general valence force field. The molecular constants viz. the mean amplitudes of vibration, the generalised mean square amplitudes of vibration, the shrinkage constants, Coriolis coupling coefficients and the centrifugal distortion constants have also been computed for the first time using the structural parameters and the vibrational frequencies. (21 refs.)

65951 Halogen-substituted amides. IV. Normal coordinate treatment of N-methylcarbamoyl bromide. E.Krishna Murthy, K.Sree Ramulu, G.Ramana Rao (Dept. of Phys., Kakatiya Univ., Warangal, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.787-9 (Oct. 1982). [received: April 1983]
For pt.III see ibid., vol.20, no.5, p.372-8 (1983). The normal coordinate treatment of N-methylcarbamoyl bromide has been carried out using a modified valence force field. The force constants are refined by the method of damped least-squares. The potential energy distributions are evluated both in internal force constants and symmetry coordinates. The results are discussed in relation to the mixing of the vibrational modes. (8 refs.)

65952 Mean amplitudes of vibration and Coriolis coupling coefficients of some octrahedral ions. C.Loganathan (Dept. of Phys., Erode Arts Coll., Erode, India), V.Sengodan, K.G.Srinivasacharya.
Indian J. Pure & Appl. Phys., vol.20, no.10, p.832-3 (Oct. 1982). [received: April 1983]
Kinetic constants method is employed to evaluate a fresh set of force constants for some XY_6 octahedral type ions using the recent vibrational frequencies. The force constants obtained are used to calculate the mean amplitude of vibration and Coriolis coupling coefficients. The results are briefly discussed. (10 refs.)

65953 Centrifugal distortion constants of platinum (IV) complexes. R.Sambathu, K.G.Srinivasacharya (Dept. of Phys., PSG Coll. of Arts and Sci., Coimbatore, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.834 (Oct. 1982). [received: April 1983]
The centrifugal distortion constants of six PtX_4L_2(X=Cl or Br; L=P,S or As) complexes are evaluated using Cyvin's modified theory. (5 refs.)

65954 Molecular constants of H_2S and D_2S using harmonic frequencies. R.Sambathu, K.G.Srinivasacharya (Dept. of Phys., PSG Coll. of Arts & Sci., Coimbatore, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.835-6 (Oct. 1982). [received: April 1983]
Using the anharmonicity correction factors for the molecules H_2S and D_2S, the harmonic frequencies are obtained and are used to evaluate the molecular constants for these two molecules. The evaluated values of the inertia defects for H_2S and D_2S and the centrifugal distortion constants for the H_2S are compared with the experimental values and the agreement is found to be good. (15 refs.)

65955 Vibrational frequencies for silaacetylene and its silylidene and vinylidene isomers [and molecular structures]. M.R.Hoffmann, Y.Yoshioka, H.F.Schaefer,III (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1084-8 (9 March 1983).
The molecular structures, vibrational frequencies, and relative energies of silaacetylene and its vinylidene and silylidene isomers have been investigated via nonempirical molecular electronic theoretical methods. Basis sets of double ζ (DZ) and double-ζ plus d function quality have been used for this purpose in conjunction with self-consistent-field (SCF) and configuration interaction (CI) wave functions. The largest CI included in a completely variational manner 8001 configurations, and analytic CI gradient methods were used to determine the structure and harmonic vibrational frequencies of silaacetylene itself. The absolute minimum on the potential energy hypersurface is the silylidene, :Si=CH_2, which lies ~50 kcal below the linear silaacetylene. The vinylidene isomer H_2Si=C: is either an extremely shallow minimum, or, more likely, not a genuine relative minimum at all. Silaacetylene is predicted to have a trans bent equilibrium geometry. (30 refs.)

65956 Sum and density of states for anharmonic polyatomic molecules. Effect of bend-stretch coupling. L.B.Bhuiyan, W.L.Hase (Dept. of Chem., Wayne State Univ., Detroit, MI, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5052-8 (15 April 1983).
A model anharmonic molecular Hamiltonian is used to study the effect of nonseparable bend-stretch coupling on sum and density of states. A bond-energy-bond-order (BEBO) type method is used to couple bending and stretching potential energy terms of a local mode Hamiltonian. The model Hamiltonian is applied to the hydrocarbon fragments H-C≡C, H-C=C, and H-C-C. The results show significant deviation from the independent oscillator model, especially when the stretches are taken to be the Morse type and the energy is close to the dissociation limit. (29 refs.)

65957 The multistate vibronic coupling problem. L.S.Cederbaum (Inst. fur Phys. Chem., Univ. Heidelberg, Heidelberg, Germany).
J. Chem. Phys. (USA), vol.78, no.9, p.5714-28 (1 May 1983).
The interaction of several closely lying electronic states through a vibrational mode is discussed. Several examples are studied which show that this interaction may lead to strong nonadiabatic effects not present in a two-stage vibronic coupling problem. Special attention is paid to the vibronic coupling problem in a manifold of randomly distributed electronic states with random coupling. A large number of computations have been peromed for such randomly determined electronic systems. In spite of the randomness of the energies and coupling constants, the calculated spectra show some joint trends and regularities. (57 refs.)

65958 Rotational analysis of the (0-3) band in the 3*A* system of $^{14}C^{16}O$. T.Siwiec-Rytel (Atomic & Molecular Phys. Lab., Pedagogical Coll., Rzeszow, Poland).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.234-43 (Feb. 1983).
The (0-3) band of the 3*A* system in the $^{14}C^{16}O$ isotopic molecule was obtained at high dispersion and the resulting spectrum analyzed. Constants describing the $\nu=0$ level of the $c^3\Pi$ state and the $\nu=3$ level of the $a^3\Pi$ state are reported. For the *c* state, spin splitting was resolved for the first time and a perturbation of the low *J*-valued level structure induced by a previously unreported $^3\Pi$ state is reported. Deperturbation of the $c^3\Pi$ state's structure leads to partial characterization of the perturbing $^3\Pi$ state. (7 refs.)

65959 cis acrolein: mixing of the S_0 and S_1 electronic states by the (a'') skeletal torsional vibration. K.K.Innes (Dept. of Chem., State Univ. of New York, Binghamton, NY, USA).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.420-4 (Feb. 1983).
Large effects of vibronic coupling upon vibrational levels of the ground ($^1A'$) and first excited ($^1A''$) singlet electronic states of cis acrolein (2-propenal) are successfully modeled. Some implications for $CH_2=CH\text{-}CHO$ spectroscopy and photophysics are discussed briefly. (11 refs.)

65960 New model for the rotational level of the H_2O ground state. V.I.Starikov, V.G.Tyuterev.
Opt. & Spectrosc. (USA), vol.53, no.3, p.333-5 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.564-6 (Sept. 1982). [received: May 1983] (3 refs.)

65961 Pade form of effective rotational molecular Hamiltonians. V.N.Bryukhanov, Yu.S.Makushkin, Vl.G.Tyuterev, V.N.Cherepanov (Inst. of Atmospheric Optics, Acad. of Sci., USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.756-9 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.86-90 (Aug. 1982). [received: April 1983]
Effective rotational molecular Hamiltonians (ERH) are constructed which differ from the traditional representation of the ERH as a power series in the total angular momentum. A Pade-form of the ERH is systematically obtained and the nonuniqueness of this form is emphasized. (14 refs.)

65962 Calculation of the dependence of the centrifugal constants of the molecule H_2O on the quantum number v_2 on the basis of the Morse oscillator. V.I.Starikov, Vl.G.Tyuterev (Inst. of Atmospheric Optics, Acad. of Sci., USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.762-5 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.93-6 (Aug. 1982). [received: April 1983]
An explanation is given for the anomalous dependence of the centrifugal distortion in flexible molecules of the type H_2O on the 'bending' quantum number v_2 on the basis of the Morse oscillator. A computation of the dependence of the rapidly varying rotational, quartic, sextic constants of the molecule H_2O on v_2 describes the experimental behavior of these constants well. (11 refs.)

65963 Collisional effects on the rovibrational transitions of the HD fundamental band. S.Nazemi, A.Javan (Dept. of Phys., MIT, Cambridge, MA, USA), A.S.Pine.
J. Chem. Phys. (USA), vol.78, no.8, p.4797-805 (15 April 1983).
The effect of collisions with self and buffer gases, Ar, Kr, and Xe, on the linewidth, line shape, and frequency of the rovibrational transitions of HD in its ground electronic state are studied with a high-resolution tunable laser difference-frequency spectrometer. Collisional narrowing, manifested in sub-Doppler width of the transitions, is observed (for the first time in HD) in both *P* and *R* branches of the infrared fundamental band. The measured line profiles and the pressure dependence of their widths are analyzed in the limits of strong and weak velocity-changing collisions. It is shown that both models fit the data equally well in the low pressure range (below about 300 Torr). The strong collision model, however, is found to be the best fit for HD/HD collisions in the entire 10-760 Torr pressure range. In the case of HD/buffer gas collisions, a model incorporating correlations between the velocity and state-changing collisions appears to be more appropriate. The dependence of collisional narrowing and broadening parameters on the rotational quantum number is reported and discussed. (35 refs.)

33.20B Radiofrequency and microwave spectra

(for NMR spectra, see 33.25; for EPR spectra, see 33.30)

65964 The nuclear hyperfine structure of deuterated ammonia. M.Bester, S.Urban, K.Yamada, G.Winnewisser (I. Phys. Inst., Univ. zu Koln, Koln, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.L13-14 (May 1983).
The ^{14}N nuclear hyperfine splitting of $^{14}NH_2D$ is reported for the two inversion components of the 1_{11}-1_{01} rotational transition centered at 85926.263(10) MHz and 110153.599(10) MHz. These precise laboratory measurements should aid further interstellar searches of NH_2D. (10 refs.)

65965 Microwave structure measurements on the cyclopropane-HCN complex. S.G.Kukolich (Dept. of Chem., Univ. of Arizona, Tucson, AZ, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4832-5 (15 April 1983).
Microwave rotational transitions for the cyclopropane-HCN complex were observed using the Flygare-Balle pulsed beam Fourier transform spectrometer. The $1_{11}\rightarrow 2_{12}$, $1_{01}\rightarrow 2_{02}$, $1_{10}\rightarrow 2_{11}$, $2_{12}\rightarrow 3_{13}$, $2_{02}\rightarrow 3_{03}$, $2_{11}\rightarrow 3_{12}$, $3_{13}\rightarrow 4_{14}$, $3_{03}\rightarrow 4_{04}$, $3_{12}\rightarrow 4_{13}$, $4_{14}\rightarrow 5_{15}$, $4_{04}\rightarrow 5_{05}$, and $4_{13}\rightarrow 5_{14}$ transitions were observed. The rotational constants obtained are $A=20243\pm 1344$ MHz, $B=1384.209\pm 0.001$ MHz, and $C=1327.901\pm 0.001$ MHz. The distortion constants are $D_J=1.53\pm 0.03$ kHz and $D_{JK}=50.9\pm 1.1$ kHz. The nitrogen quadrupole coupling strength is $eQq_{aa}=-4.38\pm 0.01$ MHz with eQq_{bb}-$eQq_{cc}=0.002\pm 0.003$ MHz. The cyclopropane carbon atoms and HCN lie in a plane. The most reasonable bond distance is obtained with the HCN hydrogen atom bonding to the midpoint between two of the cyclopropane carbon atoms. The separation of the centers of mass of HCN and cyclopropane is $R_{cm}=4.472\pm 0.002$ Å. The HCN carbon atom is $R_{CC\text{-}C}=3.476\pm 0.002$ Å from the cyclopropane carbon-carbon bond. The stretching force constant is $k_s=0.062$ mdyn/Å and the approximate bonding energy is 860 cm^{-1}. (18 refs.)

65966 Microwave, infrared and Raman spectra and structure of 2-nitropropane. J.R.Durig, J.A.S.Smith, Y.S.Li, F.M.Wasacz (Dept. of Chem., Univ. of South Carolina, Columbia, SC, USA).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.45-60 (May 1983).
The microwave spectrum of 2-nitropropane, $C_3H_7NO_2$, has been investigated from 12.5 to 40.0 GHz. Only α-type transitions were observed and *R*-branch assignments are made for the ground vibrational state. The effective rotational constants are found to have the following values: $A=5132\pm 12$, $B=2895.70\pm 0.14$, and $C=2706.51\pm 0.12$ MHz. It is shown that these rotational constants are only consistent for the conformer where one N=O bond eclipses the C-H bond. From a diagnostic least-squares adjustment to fit these three rotational constants along with reasonably assumed structural parameters for the isopropyl moiety, excluding the C-C distance, the following parameters are obtained: r(C-C)$=1.533\pm 0.006$ Å, r(C-N)$=1.508\pm 0.018$ Å, r(N=O)$=1.218\pm 0.015$ Å, spherical angle CNO$=116.8\pm 1.5°$, and spherical angle CCN$=108.9\pm 1.7°$. From a temperature study of the microwave spectrum, it appears that the NO_2 group is nearly freely rotating. The IR (3500-80 cm^{-1}) and Raman (3500-10 cm^{-1}) spectra have been recorded for both the gaseous and solid phases of 2-nitropropane. The Raman spectrum of the liquid has also been recorded and qualitative depolarization values obtained. (27 refs.)

65967 Microwave, infrared and Raman spectra, conformation, and vibrational assignement of isopropylisocyanate. J.R.Durig, K.J.Kanes, J.F.Sullivan (Dept. of Chem., Univ. of South Carolina, Columbia, SC, USA).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.61-76 (May 1983).
The low resolution microwave spectrum of isopropylisocyanate, $(CH_3)_2CHNCO$, has been recorded from 18.0 to 39.0 GHz. From the spacing of the major transitions it is shown that the value of 4031 MHz for $B+C$ is consistent with the skew conformer with a C-N=C angle of ca. 139° where the NCO moiety is eclipsing one of the methyl groups, although the trans conformer where the lone pair of electrons on the nitrogen is eclipsing the hydrogen atom cannot be entirely ruled out. The infrared (3200-50 cm^{-1}) and the Raman (3300-20 cm^{-1}) spectra have been recorded for gaseous and solid isopropyliso-cyanate. Additionally, the Raman spectrum of the liquid has been obtained and qualitative depolarization values measured. There is little indication of the presence of a second conformer at ambient temperature from a comparison of the vibrational data for the fluid and solid phases. A complete vibrational analysis, based on infrared band contours, depolarization values and group frequencies, is proposed. (22 refs.)

65968 Millimeter-wave spectrum of ethyl acetylene centrifugal distortion, Coriolis interaction and internal rotation. J.Demaison, D.Boucher, J.Burie, A.Dubrulle (Lab. de Spectroscopie Hertzienne, Univ. de Lille I, Villeneuve-d'Ascq, France).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.447-51 (April 1983).
The rotational spectrum of ethylacetylene has been investigated between 70 and 320 GHz. A Coriolis interaction has been found between the first excited state of the methyl torsion and the C-C≡C in plane deformation. Splittings of transitions in the first excited torsional state show that the barrier hindering internal rotation of the methyl group amounts to 3271 cal/mole. (12 refs.)

33.20E Infrared spectra

65969 The translational-rotational absorption spectrum of hydrogen. G.Bachet (Lab. des Interactions Atomiques et Moleculaires, CNRS, Marseilles, France), E.R.Cohen, P.Dore, G.Birnbaum.
Can. J. Phys. (Canada), vol.61, no.4, p.591-603 (April 1983).
The collision-induced translational-rotational spectrum of H_2 has been accurately measured in the region from about 30 to 2000 cm^{-1} at 195 and 297K. A very weak feature due to the hexadecapole-induced dipole, the $U_0(1)$ line, has been detected at 195K in the region around 1622 cm^{-1}. These spectra can be accurately represented by a simple, semi-empirical line shape. The effect of double transitions are considered and explicit expressions for these are given. Spectral integrals proportional to the zero and first moments are determined experimentally and compared with the theoretical moments computed on the basis of quadrupole induction for several potentials. The difference between the experimental and theoretical values, in the order of 20%, is attributed to anisotropic overlap induction, but the inferred magnitude of this component is strongly dependent on the assumed potential. (40 refs.)

65970 Collision-induced absorption in ethane-rare gas mixtures. I.R.Dagg, L.A.A.Read, A.Anderson (Univ. of Waterloo, Waterloo, Ontario, Canada).
Can. J. Phys. (Canada), vol.61, no.4, p.633-40 (April 1983).
The collision-induced spectra of mixtures of ethane and each of the rare gases He, Ar, Kr, and Xe in the 40-360 cm^{-1} region have been obtained using a Michelson Fourier transform spectrometer. In addition, the temperature dependence of the absorption in ethane and ethane-xenon mixtures is reported. All results have been analyzed according to the theory for quadrupole induced rotation-translation absorption. The absolute value of the quadrupole moment of ethane is estimated to be less than 1.0 B and most likely less than 0.5 B. Various speculations are made concerning the induction mechanisms (other than quadrupolar) for each of the mixtures. (14 refs.)

65971 Infrared linear dichroism of the T_1 state of acridine in stretched polyethylene. M.B.Mitchell, W.A.Guillory, J.Michl, J.Radziszewski (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.413-15 (15 April 1983).
Reports the first determination of the symmetry of an excited-state vibration observed with direct infrared absorption. The authors assign the excited triplet-state vibration of acridine at 751 cm^{-1} to b_1 symmetry. (3 refs.)

65972 The electronic absorption spectrum of the CNO free radical in the gas phase. D.A.Ramsay, M.Winnewisser (Herzberg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.502-4 (15 April 1983).
A new band with heads at 7963.3 and 7893.1 Å has been found during the flash photolysis of 3-methyl-4-oximinoisoxazol-5(4H)-one. By comparison with earlier work in a neon matrix, and on the basis of a partial rotational analysis, the band is assigned as the 0-0 band of the $A^2\Sigma^+$-$X^2\Pi_i$ transition of the CNO free radical. Preliminary molecular constants are given. (9 refs.)

65973 Infrared and Raman study of the interaction between methyl acetate and phenol derivatives. L.Vanderheyden, Th.Zeegers-Huyskens (Dept. of Chem., Univ. of Leuven, Heverlee, Belgium).
J. Mol. Liq. (Netherlands), vol.25, no.1, p.1-11 (March 1983).
In previous publications the authors have been concerned with the influence of hydrogen bond formation on the Raman intensity of the carbonyl stretching vibration. Hydrogen bond association of simple carbonyl bases (cyclohexanone, acetone, acetophenone) with proton donors such as phenol derivatives, hydrochloridic or hydrobromic acid brings about an intensity increase of the $\nu_{C=O}$ Raman band; moreover, the intensity enhancement is linearly related to the enthalphy of complex formation. These measurements are extended to the complexes formed between methyl acetate (MeAc) and phenol derivatives. (19 refs.)

65974 Infrared & Raman Spectra of vanillin. S.Tariq, P.K.Verma, R.Aquell (Dept. of Phys., Aligarh Muslim Univ., Aligarh, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.974-7 (Dec. 1982). [received: April 1983]
The infrared and Raman spectra of vanillin have been recorded in the region 4000-50 cm^{-1}. Hydrogen bond fundamentals and the torsion vibrations of the substituents are identified and discussed. The observed splitting of the carbonyl band is explained. Assignments of other fundamental vibrations are proposed assuming C_s symmetry for the molecule. (26 refs.)

65975 Bond polar parameters from infrared intensities in X_2CY molecules. B.Nikolova (Inst. of Organic Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria), B.Galabov, C.Lozanova.
J. Chem. Phys. (USA), vol.78, no.8, p.4828-31 (15 April 1983).
The integrated gas-phase infrared intensities in F_2CO, Cl_2CO, F_2CS, and Cl_2CS are interpreted in terms of bond polar parameters using recently proposed parametric model of IR intensities. The calculated values for the bond parameters correlate with the electronegativities of the atoms forming the chemical bonds in these molecules. It is concluded that the band intensities in the infrared spectra of these systems are largely dependent on the static charge distribution. (19 refs.)

65976 Velocity-modulated infrared laser spectroscopy of molecular ions: the ν_1 band of HNN^+. C.S.Gudeman, M.H.Begemann, J.Pfaff, R.J.Saykally (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5837-8 (1 May 1983).
The authors report the first detection and measurement of the 3.1 μm ν_1 (NH stretch) vibration-rotation band of protonated nitrogen produced in an AC glow discharge using velocity-modulation and simple lock-in detection. (10 refs.)

65977 Infrared spectrum of CO adsorbed on a platinum electrode. J.W.Russell (Dept. of Chem., Oakland Univ., Rochester, MI, USA), M.Severson, K.Scanion, J.Overend, A.Bewick.
J. Phys. Chem. (USA), vol.87, no.2, p.293-7 (20 Jan. 1983).
Polarization-modulated infrared reflection-absorption spectroscopy has been used to measure directly the infared spectrum of CO adsorbed on the surface of a platinum electrode in the presence of an electrolyte, either 1 M H_2SO_4 or 1 M $HClO_4$. The band due to the CO-stretching vibration has been found to shift with applied potential, moving to higher wavenumber as the electrode potential is made more positive. The band shape and the band area remain essentially unchanged when the potential is changed over the range 15-650 mV (NHE). The results are interpreted as evidence that, in the case of CO on Pt, there is a significant contribution to coverage-dependent shifts from electrochemical interactions between substrate and adsorbate. (13 refs.)

65978 High-resolution Fourier spectrometry of $^{14}N_2$ infrared emission spectrum: extensive analysis of the $B^3\Pi_g$-$A^3\Sigma_u^+$ system. F.Roux, F.Michaud (Lab. de Spectrometrie Ionique et Moleculaire, Univ. Lyon I, Villeurbanne, France), J.Verges.
J. Mol. Spectrosc. (USA), vol.97, no.2, p.253-65 (Feb. 1983).
The $B^3\Pi_g$-$A^3\Sigma_u^+$ system of N_2 excited in a microwave discharge was recorded between 3000 and 18000 cm^{-1} with a high-resolution Fourier spectrometer. There are no observed irregularities in the levels of the $A^3\Sigma_u^+$ and $B^3\Pi_g$ states at least for the values of ν and J considered here, except the predissociation in the $B^3\Pi_g$ state for $\nu=12$ and J higher than 33. This predissociation will be checked with more complete data in another article. Thirty three bands of the first positive system with $0\leq\nu'\leq12$ and $0\leq\nu''\leq8$ are analyzed. The molecular parameters of the $B^3\Pi_g$ and $A^3\Sigma_u^+$ are obtained by a complete fitting procedure. Derived values of equilibrium constants and deduced; RKR potential energy curves for the two states are constructed, and the Franck-Condon factors calculated for the A-B system. (16 refs.)

65979 Vibrational spectra and force constants of symmetric tops: rovibrational spectra in the ν_3 region of monoisotopic species of H_3GeCl, H_3GeBr, and H_3GeI. H.Burger, K.Burczyk, R.Eujen, A.Rahner (Anorganische Chem., Univ. Wuppertal, Wuppertal, Germany), S.Cradock.
J. Mol. Spectrosc. (USA), vol.97, no.2, p.266-86 (Feb. 1983).
The gas phase infrared spectra of several monoisotopic species of H_3GeCl, H_3GeBr, and H_3GeI have been recorded in the ν_3 region near 420, 300, and 250 cm^{-1}, respectively, with a resolution between 0.03 and 0.04 cm^{-1}. Rotational J structure of the fundamental and of several 'hot' bands of ν_3 has been resolved and analyzed by means of polynomial methods. The K structure of J clusters is indicated, and $\alpha_3{}^A$ values were estimated from a band contour simulation. The molecular parameters $\nu_3{}^0$, x_{33}, $(B_3$-$B_0)$ and $\bar{D}_J$ were determined for several isotopic combinations. The ν_3 and $2\nu_3$ levels are apparently unperturbed except for $H_3Ge^{35}Cl$ species for which Fermi resonance between $2\nu_3$ and ν_2 has been established. (12 refs.)

65980 FTIR spectroscopic studies of the matrix photoionization and photolysis products of methylene halides. B.J.Kelsall, L.Andrews (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.362-78 (Feb. 1983).
Matrix photoionization of methylene bromide produced absorptions at 1019, 897, and 788 cm^{-1} identified previously as CBr_2^+, $CHBr_2^+$, and $CHBr_2$. High-resolution FTIR spectra revealed overlapping 1/2/1 triplets for natural bromine isotopes with individual linewidths near 0.2 cm^{-1}. New absorptions at 3121, 2897, and 1345 cm^{-1} are assigned to the $(CH_2Br^+)Br$ cation complex which yields $CHBr_2^+$ on photolysis. A substantially increased yield of the $CHCl_2^+$ species made possible observation of the C-H stretching mode at 3033 cm^{-1} and the symmetric C-Cl_2 stretching mode at 845 cm^{-1} along with the previously observed stronger 1291- and 1044-cm^{-1} fundamentals. The high resolution and enhanced signal-to-noise capability of the FTIR are clearly demonstrated in this investigation. (13 refs.)

65981 Infrared diode laser spectroscopy of the FO radical ($^2\Pi_{3/2}$). A.R.W.McKellar, C.Yamada, E.Hirota (Inst. for Molecular Sci., Okazaki, Japan).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.425-9 (Feb. 1983).
The fundamental band of the FO radical in the 9.6-μm region was studied using a tunable diode laser and a Zeeman-modulated multiple-traversal absorption cell. Although it was not possible to detect any transitions belonging to the $^2\Pi_{1/2}$ substate, 14 transitions of $^2\Pi_{3/2}$ were observed and accurately measured. Analysis of these measurements gave the following molecular parameters (with $A_0=A_1$ fixed at -177.3 cm^{-1}): $\nu_0=1033.4829(5)$ cm^{-1}, $B_0=1.05285(9)$ cm^{-1}, $B_1=1.03933(8)$ cm^{-1}, $D_0=4.4(4)\times10^{-6}$ cm^{-1}, and $D_1=4.4(3)\times10^{-6}$ cm^{-1}. (11 refs.)

65982 Infrared band intensities and bond polarities. Static and rehybridization dipole moment contibutions to infrared intensities in C_6F_6. B.Galabov, C.Lozanova (Dept. of Chem., Univ. of Sofia, Sofia, Bulgaria), W.J.Orville-Thomas.
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.17-22 (May 1983).
A recently developed parametric model of infrared intensities is used to determine static and rehybridization (or charge reorganization) bond dipole contributions to the infrared intensities in hexafluorobenzene. The individual bond moment constants obtained indicate that the integrated band intensities in the IR spectrum of this molecule are determined by both equilibrium charge distribution and charge fluxes accompanying the vibrational motion, the relative importance of the two effects depending on the type and symmetry of the vibrations. The intensity of the C-F bands associated with stretching vibrations is largely related to rehybridization dipole contributions while for the bending modes the equilibrium dipole terms make greater contributsions to the band intensities. (18 refs.)

65983 The characterization of alkali arsenites and antimonites: the IR spectra of matrix-isolated $MAsO_2$ and $MSbO_2$ molecules. L.Bencivenni (Dept. of Phys. Chem., Univ. of Rome, Rome, Italy), K.A.Gingerich.
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.23-9 (May 1983).
IR matrix-isolation experiments indicate the existence of gaseous alkali arsenites and antimonites. These molecules have been studied and characterized in detail by ^{18}O enrichment measurements. For these species, a C_{2v} ring structure with O-As-O and O-Sb-O angles of 115°±5 and 106°±5, respectively, has been proposed. (5 refs.)

65984 Infrared and Raman study and ab initio calculations of internal rotation in methylisopropenyl ether. E.Gallinella, U.Pincelli, B.Cadioli (Istituto di Chimica Fisica, Univ. di Modena, Modena, Italy).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.31-43 (May 1983).
The structure of methylisopropenyl ether and its rotational isomerism have been studied both by ab initio calculations and by IR and Raman spectra. The internal potential energy function shows the existence of two isomers; the more stable one has a planar s-cis structure, the second is predicted at 4.73 kcal mol^{-1} higher in a planar s-trans form with an interconversion barrier of about 7.5 kcal mol^{-1} at a torsional angle of 97°. The computer barrier heights to internal rotation of the two methyl groups are quite different: 0.9 kcal mol^{-1} for the methyl on carbon and 4.5 kcal mol^{-1} for the methyl on oxygen. Correlation of the orbital energies is made both with respect to methylvinyl ether and methane and to propene and methanol. The first two ionization potentials have also been measured at 8.97 and 11.7 eV. The vibrational spectra show that only the s-cis isomer can be found. An assignment of the complete spectra is proposed; the torsional frequency of the methyl on carbon could not be detected. (9 refs.)

65985 Vibrational analysis of a series of n-alkyl fluorides in the solid state. G.A.Crowder, J.M.Lightfoot (Dept. of Chem., West Texas State Univ., Canyon, TX, USA).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.77-91 (May 1983).
Liquid and solid-state IR spectra have been obtained for n-$C_7H_{15}F$, n-$C_8H_{17}F$, n-$C_9H_{19}F$, n-$C_{10}H_{21}F$, and n-$C_{14}H_{29}F$ and normal coordinate calculations made for the P_c and P_H conformers of each compound. Comparisons of observed solid-state frequencies with the calculated values show the P_H conformer to be the one present in the solid state of each compound. Vibrational assignments are made with the aid of the calculations. (10 refs.)

65986 Conformational analysis of 2-chloro-4-methylpentane and 2-bromo-4-methylpentane. G.A.Crowder, R.M.P.Jaiswal (Dept. of Chem., West Texas State Univ., Canyon, TX, USA).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.93-100 (May 1983).
Liquid and solid-state IR spectra for 2-chloro-4-methylpentane, briefly discussed in a preliminary communication, are presented, along with the results of previous normal coordinate calculations. Infrared spectra are also presented for 2-bromo-4-methylpentane. The spectra show the presence of two conformations in the neat liquid (S_{HH} and S_{CH}), but only the S_{HH} conformer is stable in the crystalline solid. Normal coordinate calculations have also been made for both conformers of the bromo compound, and the resulting assignments are given. Force constants for both compounds are also given. (6 refs.)

65987 Vibrational spectra, isolated CH stretching frequencies and CH bond lengths in CH_3OCH_2X compounds (X=F, Cl, Cr, I). D.C.McKean, I.Torto, A.R.Morrisson (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.101-18 (May 1983).
Infrared and Raman spectra are reported for CH_3OCH_2X, CHD_2OCD_2X, $CD_32OCHDX$ (X=F, Cl, Br, I) and for CH_3OCD_2Cl and CD_3OCH_2Cl, in various phases. $\nu_C V_H{}^{is}$ values are obtained which enable CH bond lengths and dissociation energies to be predicted. The changes in bond lengths for Me_2O to $MeOCH_2X$ and from $MeOCH_2F$ to $MeOCH_2Cl$ are in good agreement with those calculated ab initio and in radical disagreement with microwave-based values. The effect of halogen is to strengthen all the CH bonds present, especially that lying parallel to the CX one. All major features in the spectra are explained if only the gauche skeletal conformer exists in the phases studied. However, two transient bonds in solid films of CH_3OCH_2F may indicate the presence of a metastable trans conformer phase. (16 refs.)

65988 Molecular structure, vibrational spectra and normal coordinate analysis of S-methyl dithiocarbamate. R.Mattes, L.Zhengyan, M.Thunemann, H.Schnockel (Inst. of Inorganic Chem., Univ. of Muenster, Muenster, Germany).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.119-32 (May 1983).
The crystal structure of *S*-methyl dithiocarbamate (SMDTC) has been determined by single crystal X-ray diffraction. The IR spectra, matrix IR spectra and Raman spectra os SMDTC-d_0, $-d_2$ and $-d_3$ have been measured between 4000 and 30 cm^{-1}. Raman spectra in solution and in the molten state have also been obtained. The assignments are supported from a normal coordinate analysis. In the solid state SMDTC exists as the E conformer. In solution and in the liquid state two conformers are found; in the matrix spectra only one, probably the E conformer, is observed. (29 refs.)

65989 Infrared intensities of pregn-1,4-diene-3,20-dione derivatives. O.Egyed, G.Jalsovszky, S.Holly (Central Res. Inst. for Chem., Hungarian Acad. of Sci., Budapest, Hungary).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.133-6 (May 1983).
The IR absorption intensities of the νC=O and νC=C bands of some pregn-1, 4-diene-3, 20-dione derivatives have been determined by means of a Fourier-transform infrared spectrometer. The integrated intensities were calculated by fitting Gauss-Cauchy sum functions to the experimental spectra using an iterative non-linear least-squares method and numerical integration. The intensities of the A-ring vibrations of pregn-4-ene-3,20-dione and pregn-1,4-diene-3,20-dione derivatives were compared, and the νC=O band intensities of different 21-acylated derivatives were investigated. (7 refs.)

65990 Conformation behaviour of dimethylmethylphosphonate and methyldimethylphosphinate studied by infrared spectroscopy in low-temperature matrices. A.J.Barnes, S.Lomax (Dept. of Chem. & Appl. Chem., Univ. of Salford, Salford, England), B.J.Van Der Veken.
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.137-45 (May 1983).
Infrared spectra are reported for dimethylmethylphosphonate (DMMP) and methyldimethylphosphinate (MDMP) in argon, methane, nitrogen and carbon monoxide matrices at 20K and compared with spectra in gas, solution, liquid and solid phases. Evidence is presented for the existence of three conformers of DMMP, one of which has a low dipole moment and is the only conformer found in the gas phase, while the other two, polar, conformers occur in the liquid phase. In matrices or solutions the conformational distribution depends on the polarity of the medium. For MDMP, no conclusive evidence has been found for the existence of more than one conformer in matrices. (7 refs.)

65991 Integral emission and absorption characteristics of CO_2 and CO bands in conditions of vibrational disequilibrium. N.N.Kudryavtsev, S.S.Novikov.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.831-6 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.125-32 (July 1982). [received: March 1983]
A numerical investigation was performed of the influence of the parameters of a vibrationally nonequilibrium gas on the integral emission and absorption characteristics of CO_2 molecules in the 4.3- and 2.7-μm bands and of CO molecules in the 4.7-μm band. The reason for investigating the integral characteristics of the vibrational-rotational bands was that the low emission intensity of the gas in the given conditions, in combination with the requirements of ensuring sufficient sensitivity of the optical systems with high time resolution, leads to the need to record radiation in broad spectral ranges, corresponding to the whole, or a considerable part, of the band. (14 refs.)

65992 Vibrational spectra and rotational isomerism of 1,2-dimethyldisilane. K.Ohno, M.Hayashi, H.Murata (Dept. of Chem., Hiroshima Univ., Hiroshima, Japan).
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.373-82 (1983).
The IR and Raman spectra of 1,2-dimethyldisilane and its Si-perdeuterated species have been measured for the liquid and solid states. Existence of rotational isomers about the Si-Si bond was shown on the basis of the spectral examination and the normal coordinate treatment. The fundamental vibrations were assigned for the two possible rotational isomers. (21 refs.)

65993 Resonance Raman scattering with a forbidden but vibronically allowed electronic transition: excitation profiles of combinations and overtones of copper tetraphenylporphyrin in the Q-band resonance. S.Aramaki, H.Hamaguchi, M.Tasumi (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.555-9 (22 April 1983).
Resonance Raman scattering with the Q band of CuTPP shows a peculiar intensity pattern; bands due to combinations and overtones are strong, whereas the corresponding fundamentals are very weak. By a quantitative analysis of excitation profiles, this phenomenon has been fully accounted for on the basis of the vibronic theory of Raman intensities. Vibronic coupling parameters between the Q and B states of CuTPP have been obtained. (16 refs.)

65994 The spectra and structure of diboron trioxide. L.V.Serebrennikov, Yu.N.Sekachev, A.A.Maltsev (Dept. of Chem., Moscow State Univ., Moscow, USSR).
High Temp. Sci. (USA), vol.16, no.1, p.23-34 (Feb. 1983).
The infrared spectra of $^{10,11}B_2{}^{16,18}O_3$ molecules isolated in argon and xenon matrices have been studied in the 3200-4000 cm^{-1} region. The Raman spectrum of natural B_2O_3 has been obtained. The following set of fundamentals is suggested for diboron trioxide: A_1:2061, 1062, 462 (or 489), and 73 cm^{-1}; B_1:2061 (1062) and 489 cm^{-1}. Plausible structures for the B_2O_3 molecule have been discussed. (32 refs.)

65995 Theoretical study of the effects of vibrational-rotational interactions on the Raman spectrum of N_2. S.R.Langhoff, C.W.Bauschlicher,Jr. (NASA Ames Res. Center, Moffett Field, CA, USA), D.P.Chong.
J. Chem. Phys. (USA), vol.78, no.9, p.5287-92 (1 May 1983).
A systematic study of the polarizability and polarizability derivatives of N_2 is undertaken as a function of basis set and level of correlation treatment. The value obtained for the ratio of derivatives ($r_e\beta'_e/\beta_e$) of the polarizability anisotropy $\beta=\alpha_{\parallel}-\alpha_{\perp}$ is 3.15±0.2, which is larger than the two experimental estimates of 2.63±0.29 and 2.22±0.44. (33 refs.)

65996 Resonance Rayleigh scattering of cyanine dyes in solution. J.Anglister, I.Z.Steinberg (Dept. of Chem. Phys., Wiezmann Inst. of Sci., Rehovot, Israel).

J. Chem. Phys. (USA), vol.78, no.9, p.5358-68 (1 May 1983).

Every process of light absorption is inherently associated with a resonance scattering of the incident beam regardless of the nature of the absorbing molecules. Both the real and imaginary parts of the refractive index contribute to the resonance scattering, and marked depolarization is expected to be observed as a rule in the light scattered by complex molecules. The resonance and near-resonance Rayleigh scattering has been measured for a number of cyanine dyes: pseudocyanine, orthochrome T, 1,1'-diethyl-2,2'-pyridyl-quinolyl cyanine, and pinacyanol chloride, in a number of solvents. In no case was the measured scattering intensity weaker than that expected theoretically, and good agreement between theory and experiment was found as a rule at the blue part of the absorption bands. In contrast, the measured scattering intensities exceeded (by up to fourfold) the theoretically expected values as the red parts of the absorption bands. Possible reasons for this discrepancy are discussed. (19 refs.)

65997 Vibrational spectra and normal coordinate analysis of *p*-bis(dimethyl-hydroxy-silil)benzene-d_0 and $-d_4$. G.Sbrana, N.Neto (Centro di Studio sullar Chimica e la Struttura dei Compositi Eterociclici, CNR, Firenze, Italy), M.Muniz-Miranda, M.Nocentini.

Spectrochim. Acta Part A (GB), vol.39A, no.4, p.295-303 (1983).

The IR and Raman spectra of *p*-bis(dimethyl-hydroxy-silil)tetradeuterobenzene have been obtained and compared with data of the corresponding normal compound. Complete normal mode calculations of both -d_0 and $-d_4$ derivatives have been carried out using a set of valence force constants transferred from suitable molecules and refined to account for the observed IR and Raman data. Results of a model calculation, in which substituents are considered as point masses, are also discussed in order to provide a convenient stating point to study the chain conformation of a polymer obtained through polycondensation of the investigated molecule. (10 refs.)

65998 Thermal molecular beam matrix spectroscopy of cyclobutanol: temperature dependence of lineshapes and the conformation problem. R.Gunde, H.Gunthard (Lab. of Phys. Chem., Swiss Federal Inst. of Technol., Zurich, Switzerland).

Spectrochim. Acta Part A (GB), vol.39A, no.4, p.315-26 (1983).

Thermal molecular beam spectra of cyclobutanol isolated in Ar and Xe matrices and the temperature dependence of the ν(OH) Raman line are reported. Six matrix bands are shown by lineshape analysis to consist of 4-6 components which systematically decrease and increase with increasing temperature of the molecular beam source. Data on lineshape parameters and relative intensities are reported. Likewise the ν(OH) Raman band is shown to consist of four components which behave with respect to temperature dependence analogously to the matrix bands. The results will be discussed in terms of two models. (23 refs.)

65999 Raman and IR studies of the antileprotic drug Dapsone. R.D'Cunha, V.B.Kartha (Spectroscopy Div., Bhabha Atomic Res. Centre, Bombay, India), S.Guranini.

Spectrochim. Acta Part A (GB), vol.39A, no.4, p.331-6 (1983).

No information is availabe on the mode of action of Daspone (4,4-diamino,diphenyl sulphone) in leprosy treatment, the phenomena of drug resistance and toxicity. Information on the interaction of Dapsone with serum proteins can be obtained at the molecular level by spectroscopic investigations on structural changes of the system. As a first step in these investigations, the IR and laser Raman spectra of Dapsone and *N*-deutero Dapsone have been obtained. The characteristic vibrational frequencies of the NH_2 group the SO_2 group and the aromatic ring have been identified and assigned from isotope shifts and studies in various solvents. (11 refs.)

66000 Electronic absorption and emission studies of the Group IIIA metal suboxides isolated in cryogenic rare gas matrices. M.A.doublas, R.H.Hauge, J.L.Margrave (Dept. of Chem., Univ. of Texas, Houston, TX, USA).

High Temp. Sci. (USA), vol.16, no.1, p.35-54 (Feb. 1983).

Electronic absorption and emission studies of matrix-isolated M_2O (M=Al, Ga, and In) have been used to characterize three electronically excited states for each of these molecules. Experimental evidence suggests that the B states have a different spin multiplicity than the ground states. In absorption, progressions in the symmetric stretching and bending modes are observed for the $A \leftarrow X$ and $C \leftarrow X$ systems of one or more of the metal suboxides. The $C \rightarrow X$ emission system for Al_2O exhibits a ground state progression in the symmetric stretching mode, which is established as 471 ± 15 cm^{-1}. Ground state Al_2O is linear or very nearly so, consistent with previous thermochemical and mass spectrometric studies of Al_2O. (25 refs.)

66001 Spectrophotometric study of some praseodymium mixed ligand complexes in different environments. M.P.Bhutra, A.K.Gupta (Dept. of Phys., Univ. of Jodhpur, Jodhpur, India).

Indian J. Pure & Appl. Phys., vol.20, no.12, p.954-7 (Dec. 1982). [received: April 1983]

Absorption spectra of four praseodymium complexes in water, formamide and dimethylsulphoxide have been recorded in the region 360-650 nm. Various energy, bonding and intensity parameters have been calculated. The effects of various ligands on the position and intensity of the observed transitions in different environments, have been discussed in terms of metal-ligand coordination. It has been observed that the intensity of ${}^3P_2 \leftarrow {}^4H_3$ transition varies with the covalency of the complexes. (20 refs.)

66002 Kinetic study of the $KrXe^+$ heteronuclear ion emission. P.Millet, A.Birot, H.Brunet, M.Espagnan, J.Galy, Y.Salmero (Centre de Phys. Atomique, Univ. Paul Sabatier, Toulouse, France).

J. Phys. B (GB), vol.16, no.8, p.1383-92 (28 April 1983).

The emission spectra of KrXe mixtures were plotted at different total pressures and at xenon concentrations varying from 0.5 to 99%. A characteristic emission of the mixture was seen at 490 nm, it appeared as soon as possible as the mixture contained 0.5% xenon. The emission at 490 nm has a maximum intensity at a xenon concentration of 20%. The shape of the light pulses obtained for this transition is described by an exponential decay with a time constant corresponding to the formation of the radiative state. The $KrXe^+$ ion involved is the $IV^1/_2$ state; the kinetic scheme given defines the role and the value of the various reaction rate constants. (11 refs.)

66003 Spectra of the ammonium radical: the Schuster band of ND_4. G.Herzberg (Nat. Res. Council of Canada, Ottawa, Ontario, Canada), J.T.Hougen.

J. Mol. Spectrosc. (USA), vol.97, no.2, p.430-40 (Feb. 1983).

The Schuster band of ammonia occurs in many kinds of electric discharges through streaming ammonia if the pressure is not too low. While it is entirely diffuse for ordinary ammonia it shows a fairly clear structure (and an isotope shift) when produced with heavy ammonia (ND_3). Studies with intermediate isotopes show conclusively that there are four H atoms and a single N atom present in the molecule responsible for this spectrum, i.e. that it is due to the ammonium (NH_4) radical. An attempt is made to understand the structure of the ND_4 Schuster band in terms of a tetrahedral configuration of the molecule in both upper and lower state. By assuming that the lower state is the (predissociating) ground-state $3s^2A_1$ of the molecule while the upper state is a ${}^2F_2$ state derived from a $3d$ electron it is possible to obtain quite a fair and detailed representation of the observed structure including partly resolved tetrahedral splittings in the upper state. The agreement of the wavenumber of the band origin with several recent ab initio calculations is not as good as one might wish and not as good as in the analogous case of H_3. This and other difficulties of the present interpretation of the spectrum are briefly discussed. (27 refs.)

33.20L Ultraviolet spectra

66004 Observation by laser ionization spectroscopy of vibrationally excited nitric oxide following $O({}^1D_2)+N_2O \rightarrow 2NO$. N.Goldstein, G.D.Greenblatt, J.R.Wiesenfeld (Dept. of Chem., Baker Lab., Cornell Univ., Ithaca, NY, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.410-12 (15 April 1983).

Nitric oxide in $v'' \leq 11$ has been detected using one-photon resonant laser ionization spectroscopy following the reaction of electronically excited oxygen atoms with nitrous oxide. The nascent rotational distribution appears to differ significantly from that observed to 300K. (9 refs.)

66005 Two-photon absorption study of Zn(II)tetraphenylporphin: role of a higher excited singlet state of gerade symmetry. S.Tobita, I.Tanaka (Dept. of Chem., Tokyo Inst. of Technol., Tokyo, Japan).

Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.517-21 (22 April 1983).

The S_2 state fluorescence of Zn(II)tetraphenylporphin has been studied by using two-photon absorption and optical-optical double-resonance techniques. The main process to populate the S_2 state was found to be a stepwise two-photon absorption to the S_n state through the S_1 state. The large absorption cross section of the $S_n \leftarrow S_1$ transition (6.8×10^{-16} cm^2 molecule^{-1}) at 540 nm suggests that there exists a higher excited singlet state of gerade parity. (18 refs.)

66006 Analysis of the 254.7 nm absorption system of carbonyl fluoride. R.H.Judge, D.C.Moule (Dept. of Chem., Brock Univ., St. Catharines, Ontario, Canada).

J. Chem. Phys. (USA), vol.78, no.8, p.4806-10 (15 April 1983).

The 230 nm absorption spectrum of carbonyl fluoride has been recorded in the vapor phase at 25° and −78°C at path lengths up to 48 m. In all, 170 bands were observed in the spectrum and were assigned to vibrational activity in ν_1', ν_2', ν_3', ν_4', and ν_5'. The presence of temperature sensitive bands attributed to ν_4'' lead to the interpretation that the excited state is nonplanar. Combination differences isolating ν_4'' show that the inversion doubling splitting is less than the experimental error for levels 4^+ and 4^- in the Q_4 mode of vibrational excitation. A fit of the G_4 term values to the energy levels derived from a quadratic-Lorentzian function yielded a central barrier of 8200 cm^{-1} and an out-of-plane angle of 31.8° for $V(Q_4)$. The high barrier is attributed to an inductive effect from the fluorine atoms brought about by a relaxation of the symmetry from C_{2v} to C_s on electronic excitation. (15 refs.)

66007 UV absorption spectra of vibrationally highly excited toluene molecules. H.Hippler, J.Troe, N.J.Wendelken (Inst. fur Phys. Chem., Univ. Gottingen, Gottingen, Germany).

J. Chem. Phys. (USA), vol.78, no.9, p.5351-7 (1 May 1983).

Vibrationally highly excited toluene molecules with an energy of 52000 cm^{-1} have been prepared by UV laser excitation and subsequent iosmerization of the isomer cycloheptatriene. The UV absorption spectrum of the toluene, whose vibrational energy would correspond to the average energy of thermal molecules at 2800K, has been measured over the range 210-270 nm. It is compared with the UV spectrum of thermal molecules heated in shock waves up to 1800K. All spectra, corresponding either to microcanonical or canonical energy distributions, can be represented by a modified Sulzer-Weiland equation. It is concluded that the absorption coefficients can be expressed to a first approximation by the average energy of the excited molecules independent of their energy distribution. (20 refs.)

33.20R X-ray spectra

66008 Use of X-ray spectra to determine the semiempirical parameters of 4d transition metals. A.A.Voityuk (Inst. of Inorganic Chem., Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.355-9 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.37-42 (May-June 1982). [received: Feb. 1983]
The possibility of using X-ray emission spectra to calibrate the parameters used in semiempirical methods for calculating the electronic structures of molecules has been examined. A relationship has been found between the position of the level of a metal α_M and the value of the resonance parameter β_{ML} on the one hand, and the X-ray spectral parameters on the other. The experimental spectra of the metals in octahedral complexes of Pd, Rh, and Ru have been used to obtain the values of the parameters of these metals. The relationship between the profile of the X-ray spectrum and the charge on the metal atom in analogous compounds has been analyzed. The experimental FK_α and ClK_β spectra of the complexes $[ML_6]$, where L=F or Cl, have been used to find the value of the parameters of the ligand-ligand resonance interaction. (21 refs.)

66009 Change in the electronic structure of the thiocyanate ion on coordination. L.N.Mazalov, A.A.Voityuk, G.K.Parygina (Inst. of Inorganic Chem., Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.364-8 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.48-53 (May-June 1982). [received: Feb. 1983]
A quantum-chemical and X-ray spectral study of the redistribution of electron density in the SCN^- on coordination has been carried out. It has been established that the profile of the X-ray SK_β-spectrum of a complex containing the thiocyanate group is related unambiguously to the mode of coordination of the ligand. An analysis of the change in the strength of the S-C and C-N bonds in the thiocyanate groups has been carried out. It has been shown that calculations of the electronic structure of model molecules give the principal changes in the electron density distribution in the ligand on coordinate bond formation. (13 refs.)

66010 Electronic structure of benzene studied in USX emission. J.Nordgren, L.Selander, L.Pettersson, R.Brammer, M.Backstrom, C.Nordling (Inst. of Phys., Uppsala Univ., Uppsala, Sweden), H.Agren.
Phys. Scr. (Sweden), vol.27, no.3, p.169-71 (March 1983).
A high resolution Ultra Soft X-ray (USX) emission spectrum of gaseous benzene has been recorded. The spectrum is interpreted by means of ab initio one-center intensities and electron spectroscopic data. A comparison is made with USX spectra of solid benzene showing a uniform shift towards higher photon energies for the gas phase spectrum. The solid and gas phase USX spectra show quite different satellite structure which is interpreted in terms of photon and electron excitation of spectra. (25 refs.)

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

66011 Transmission of spin-spin coupling constants through different paths in bicyclo(2,2,1)heptane: their calculation using inner projections of the polarization propagator. G.E.Scuseria, J.C.Facelli, R.H.Contreras, A.R.Engelmann (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina).
Chem. Phys. Lett. (Netherlands), vol.96, no,5, p.560-2 (22 April 1983).
Inner projections of the polarization propagator are used to calculate components of the Fermi contact interaction between protons attached to the bridgehead carbon atoms of bicyclo(2,2,1)heptane. Four- and five-bond paths and through-space interaction are considered. Reasonable path additivity and agreement with experimental data are found at the INDO level. (15 refs.)

66012 A ^{11}B NMR study of 5,6-dicarba-nido-decaborane (12). B.Stibr, S.Hermanek, Z.Janousek, Z.Plzak, J.Dolansky, J.Plesek (Inst. of Inorganic Chem., Acad. of Sci., Prague, Czechoslovakia).
Polyhedron (GB), vol.1, no.11-12, p.822-4 (1982).
Final assignment of all eight signals in the ^{11}B NMR spectrum (64.2 MHz) of 5,6-dicarba-nido-decaborane (12) is reported on the basis of its substituted derivatives. (10 refs.)

66013 On the estimation of relaxation contributions to internal motion. H.Sterk, E.Bittersmann (Inst. fur Organische Chem., Univ. Graz, Graz, Austria).
J. Mol. Liq. (Netherlands), vol.25, no.1, p.39-50 (March 1983). In German.
Spin-lattice T1 and spin-spin T2 relaxation times of primary and tertiary amines were investigated by two different models (Woessner 1969 (a), Jardetzky 1980 (b)). It is shown that the internal diffusion constants D_i of the alkylchains can be well described by D_i^o and a formal rotational barrier. The overall correlation times determined from different independent T1 and T2 measurements are in excellent agreement. The weighted frequencies of motion λ_i of model (b) correlate to the D_i and D_o of model (a). (9 refs.)

66014 PMR spectra of some substituted pyrazines and 2,3-dihydropyrazines. J.Chellappa, K.Pandiarajan, T.Rangarajan (Dept. of Chem., Annamalai Univ., Annamalainagar, India).
Indian J. Chem. B, vol.21B, no.8, p.778-9 (Aug. 1982). [received: April 1983]
PMR spectra of 2, 5, 6-triphenyl-2, 3-dihydropyrazine (Ia), 2-alkyl-3, 5, 6-triphenyl-2, 3-dihydropyrazines (Ib-d) and the corresponding pyrazines (IIa-d) reveal that dihydropyrazines (I) are not planar and the dihedral angle about the C_2-C_3 bond in the ring is close to 60°. Effect of alkali groups on the chemical shift of the benzylic proton of I has been discussed. Further, alkyl groups inhibit the resonance interaction between the phenyl group and the pyrazine ring. (6 refs.)

66015 Mechanism of T_1 relaxation in ^{13}CO complexed to an iron porphyrin: implications for CO bonding in heme proteins. T.Perkins (Dept. of Chem., California Inst. of Technol., Pasadena, CA, USA), J.D.Satterlee, J.H.Richards.
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1350-4 (9 March 1983).
Chemical shifts and spin-lattice relaxation parameters for ^{13}CO bonded to the complex 1-methylimidazole-iron protoporphyrin dimethyl ester are reported. The ^{13}CO chemical shifts are much different from those observed in the carbonyl vertebrate hemoglobins, but remarkably similar to that observed for the monomeric hemoglobin component from Glycera dibranchiata. The relaxation parameter, T_1, is shown to change dramatically upon ligation to both the hemin model system and to hemoglobin A. The mechanisms of spin-lattice relaxation are dominated by chemical shift anisotropy for ^{13}CO bound to both hemins and proteins, but, in the latter, dipole-dipole forces make an additional contribution to the overall relaxation rate. (40 refs.)

66016 Vibrationally averaged structure of azulene partially oriented in a nematic phase. A.D.Hunter, E.E.Burnell (Dept. of Chem., Univ. of British Columbia, Vancouver, BC, Canada), T.C.Wong.
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.159-64 (May 1983).
The NMR spectrum of azulene partially oriented in a nematic phase has been measured, and the geometry of the proton skeleton and the values of the indirect spin-spin coupling constants determined. The results, after correcting for the effects of molecular vibrations, are combined with electron diffraction data to yield the molecular structure. Within one degree, all CH bonds bisect CCC angles. (12 refs.)

66017 Interpretation of lanthanide-induced shifts in NMR spectra. The case of nonaxial symmetry. T.A.Babushkina, V.F.Zolin, L.G.Koreneva (Inst. of Radioengng. & Electronics, Acad. of Sci., Moscow, USSR).
J. Magn. Resonance (USA), vol.52, no.2, p.169-81 (April 1983).
The approach to the treatment of low-symmetry systems by the method of lanthanide shift reagents (LSR) is considered. Analysis of the results obtained by optical spectroscopy (mostly by luminescence spectroscopy of Eu^{3+} ion) is used for this purpose. From the spectra mentioned, a model of the LSR adduct and parameters describing anisotropy of magnetic susceptibility are obtained. The method is applied to several rare-earth complexes of nonaxial symmetry. Bleaney's theory (1972) connecting pseudocontact NMR shifts to crystal field parameters of the second order is verified and shown to be correct if the crystal field splittings are of the order of kT. The systems $Ln(dpm)_3$ and $Ln(fod)_3$ are discussed. (36 refs.)

66018 Solvent dependence of deuteron quadrupole coupling constants and of methyl angles of some CD_3X compounds determined by NMR of partially oriented molecules. J.Jokisaari, P.Diehl, J.Amrein (Dept. of Phys., Univ. of Basel, Basel, Switzerland), E.Ijas.
J. Magn. Resonance (USA), vol.52, no.2, p.193-201 (April 1983).
The deuteron quadrupole coupling constants, Q_D, and methyl angles of the solute molecules CD_3CN, CD_3Br, CD_3I, and CD_3NO_2 were determined in various liquid-crystal solvents by use of NMR spectroscopy of oriented molecules. Carbon-13 satellites at natural abundance in the ^{2}H or ^{1}H spectra were used for the measurement of the degree of order of the C-D bonds. The results reveal a strong solvent dependence of Q_D (maximum variation of 26% in CD_3NO_2) as well as of the DCD angle (maximum variation of 2.3 degrees in CD_3I). These large apparent effects are attributed to much smaller real variations occurring in a two-site interaction. A general correlation between increasing anisotropy of the solvent diamagnetic susceptibility, decreasing Q_D, and increasing DCD angle is observed. (21 refs.)

66019 Structure and orientation of propargyl chloride partially oriented in a nematic mesophase. E.E.Babcock, J.H.Goldstein (Dept. of Chem., Emory Univ., Atlanta, GA, USA).
J. Magn. Resonance (USA), vol.52, no.2,. p.247-53 (April 1983).
The proton nuclear magnetic resonance spectra, including ^{13}C satellites at natural abundance, of propargyl chloride partially oriented in a nematic phase were analyzed. The direct coupling constants obtained were corrected for harmonic vibrations and used to calculate geometrical and orientational information. A variation in the temperature at which the NMR spectra were recorded had a negligible effect upon the structure. The difference between the vibrationally uncorrected and corrected distance ratios is substantial. (21 refs.)

66020 Cadmium-113 NMR spin-lattice relaxation and exchange kinetics in Concanavalin A: A double saturation transfer experiment. P.D.Ellis, P.P.Yang, A.R.Palmer (Dept. of Chem., Univ. of Southern Carolina, Columbia, SC, USA).
J. Magn. Resonance (USA), vol.52, no.2, p.254-66 (April 1983).
The fields dependence of the 113Cd relaxation rate in cadmium-substituted Concanavalin A was investigated at three magnetic field strengths, 2.3, 4.7, and 9.4 T. Because of the anomalously large relaxation rate observed for the resonance corresponding to free cadmium in the system and the authors' prior knowledge that cadmium is undergoing chemical exchange in this system, a detailed analysis was undertaken of the relaxation data obtained at 9.4 T to investigate the relative importance of chemical exchange dynamics upon the observed relaxation time constants. The differential equations for the resulting restricted three-site exchange network can be solved in closed form by employing a double saturation transfer experiment in conjunction with a saturation-recovery T_1 experiment. The analysis of these data demonstrate that chemical exchange processes contribute 14, 75, and 20% to the observed relaxation time constants for the ^{113}Cd resonances for the SI site, free cadmium and the S2 site respectively. If the possibility of exchange contributions to the NOE were ignored, then the observed field dependence of T_1 could not be discussed in terms of conventional single correlation time theories of relaxation. In this case the data could be discussed in terms of correlation times involving overall motion of the protein coupled with correlation times describing 'internal motions'. These internal motions may be the result of the formation of 'abortive' complexes with exogenous ligands for those metalloproteins where the metal can be readily removed from the protein. However, for Con A, it is shown that the weak field dependence observed for the

heteronuclear NOE is not due to internal motions, but rather to exchange processes. (17 refs.)

66021 **2D correlation spectroscopy in homonuclear dipolar-coupled solids.** N.Schuff, U.Haeberlen (Max-Planck-Inst. fur Medizinische Forschung, Heidelberg, Germany).

J. Magn. Resonance (USA), vol.52, no.2, p.267-81 (April 1983).

A novel 2D proton solid-state NMR experiment is described in which the spins evolve freely during the evolution period, while they are decoupled from each other by a multiple-pulse sequence in the detection period. The resulting 2D spectrum allows the correlation of chemical shifts with dipolar interactions. It is useful for assigning proton chemical shift tensors and for recording simplified wide-line spectra whose meaning is discussed in terms of a 'gedanken' experiment. The method is applied to a single crystal of malonic acid (MA). The long-standing problem of assigning the previously measured proton chemical shift tensors in MA to the proton sites is solved. For the first time line splittings are resolved which result from dipolar interactions of the carboxylic protons in MA. They are discussed in terms of the geometry of the hydrogen bonds formed by these protons. (13 refs.)

66022 **Calculation of transverse relaxation times from lineshapes modified by Gaussian-exponential filtering.** G.Braoudakis (Dept. de Statistique et Informatique Medicales, Inst. de Medicine Sociale et Preventive, Univ. de Lausanne, Lausanne, Switzerland), I.P.Gerothanassis, J.Lauterwein.

J. Magn. Resonance (USA), vol.52, no.2, p.288-92 (April 1983).

The authors present a simple computer-aided way to evaluate T_2 values from lineshapes modified by the Gaussian-exponential filtering. (15 refs.)

66023 **How restricted are partially restricted MO calculations? A few comments on the calculations of spin-spin coupling pathways at the INDO/FPT level.** R.Laatikainen (Dept. of Chem., Univ. of Manitoba, Winnipeg, Manitoba, Canada).

J. Magn. Resonance (USA), vol.52, no.2, p.293-8 (April 1983).

While standard FPT/INDO MO calculations are widely used, and are sometimes useful in the prediction of conformational or structural behavior of spin-spin couplings, a more detailed and informative picture can be obtained if the total coupling is divided into π, σ, TS (through space), and other specific contributions. The history of the calculations was reviewed by Kowalewski (1977). Recently, Engelmann et al. (1981) and Fukui et al. (1981, 1982) developed the PRMO and SOS2 methods. The NNBI procedure, especially useful in the calculation of TS contributions, was described by Barfield (1980). Attempts to apply PRMO to the interpretation of TS components of several H-H, H-F, and H-C couplings, and some important differences found betwen PRMO and NNBI results, led to the calculations described. The author points out that when the TS contribution is computed by the PRMO method, setting some atomic orbitals to be restricted, the contribution so obtained may often contain a large component due to the change in the spin polarizability near the perturbed nuclei. A few examples are discussed, PRMO and NNBI methods are compared, and the meaning of the π contribution is briefly discussed. (9 refs.)

66024 **^{13}C shift anisotropies in polycrystalline calcium formate.** R.Richarz (Varian Ltd., Zug, Switzerland), H.Sauter.

J. Magn. Resonance (USA), vol.52, no.2, p.308-9 (April 1983).

Experiments on solid samples are a convenient source of anisotropic NMR parameters. With the advent of magic-angle spinning high-resolution spectra of polycrystalline material can be obtained. If the rotation is not fast compared to the anisotropy of the chemical shift, spinning side bands appear, from which the anisotropies can be extracted. (2 refs.)

66025 **The use of dimethyl selenide as a chemical shift reference in ^{77}Se NMR spectroscopy.** N.P.Luthra, R.B.Dunlap, J.D.Odom (Dept. of Chem., Univ. of Southern Carolina, Columbia, SC, USA).

J. Magn. Resonance (USA), vol.52, no.2, p.318-22 (April 1983).

In recent years the utility of ^{77}Se NMR spectroscopy in the study of inorganic, organic, and biological systems has been demonstrated. Selenium-77 is a spin-1/2 nucleus and offers adequate natural abundance (7.5%) and relative receptivity (5.26×10^{-4} with respect to ^{1}H and 2.98 with respect to ^{13}C) as well as a large chemical shift range ~2800 ppm; extremes are 1-thia-3,3,5,5-tetramethyl-4-cyclohexanselone (2135 ppm) and disilyl selenide (−666 ppm). Moreover, the resonance of the ^{77}Se nucleus is extremely sensitive to its electronic environment. (23 refs.)

66026 **Multiplet selection using multiple quantum coherence.** P.J.Hore, R.M.Scheek, R.Kaptein (Dept. of Phys. Chem., Univ. of Groningen, Groningen, Netherlands).

J. Magn. Resonance (USA), vol.52, no.2, p.339-42 (April 1983).

Among the various methods devised to combat the nuisance of overcrowded NMR spectra, there are number which involve the excitation and detection of multiple-quantum (MQ) coherence. These techniques exploit MQ phase and precession properties to limit the information content of an NMR spectrum and thereby improve resolution. Thus, MQ NMR has been used to remove quadrupolar splittings, to reduce the spectral complexity of molecules oriented in liquid crystals, and for the selection of multiplets. An elegant example of the latter is a method of tracing the carbon skeleton of an organic molecule via the ^{13}C-^{13}C scalar couplings. Suppression of the strong singlet resonances from isolated ^{13}C nuclei is accomplished by preparing and selectively detecting double-quantum coherence between pairs of coupled ^{13}C spins. A recent modification of this experiment attained a higher level of simplificaiton of ^{1}H spectra by eliminating not only all singlets but also all multiplets other than the two doubles from a preselected pair of coupled spins. The method, referred to a DOUBTFUL, has been applied successfully to cytosine H5, H6 protons in a fragment of *lac* operator DNA. One cannot excite N-quantum coherence in a molecule with fewer than N coupled spins-$^{1}/_{2}$; selective detection of N-quantum coherence therefore filters out the smaller spin systems leaving only those with $\geq N$ nuclei. For this purpose it is generally desirable to use the highest quantum coherence possible in the spin system of interest. The authors describe an extension of the double-quantum DOUBTFUL idea to triple-quantum coherence. The experiment is designed to detect isolated three-spin systems in ^{1}H NMR spectra that are complicated by spectral overlap. For example, in protein NMR spectra ABX or AMX spin systems occur for the $C_{\alpha}H$-$C_{\beta}H_2$ groups in the amino acid residues, Asn, Asp, Cys, His, Phe, Ser, Trp, and Tyr and specific detection of these spin systems could be very valuable. (23 refs.)

66027 **X-ray spectral study of the electronic structure of organic four-and five-coordinated silicon derivatives.** S.G.Shevchenko, V.P.Elin, G.N.Dolenko, V.P.Baryshok, V.P.Feshin, Yu.L.Frolov, L.N.Mazalov, M.G.Voronkov (Inst. of Inorganic Chem., Acad. of Sci., USSR).

J. Struct. Chem. (USA), vol.23, no.3, p.360-4 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.43-7 (May-June 1982). [received: Feb. 1983]

The chemical shifts of the Si$K\alpha$ and C1$K\alpha$ lines have been determined. They have been used to obtain the Pauling charges on the silicon and chlorine atoms in silatrane molecules of the type $XSi\ (OCHRCH_2)_{3-n}(OCH_2CH_2)_nN$ (R=H, CH$_3$, n=0-3), the corresponding Si-substituted derivatives of triethoxysilane $XSi(OCH_2CH_3)_3$ (X=H, Cl, CH$_3$, ClCH$_2$), and the heterocyclic compounds $(CH_3)_2Si(OCH_2CH_2)_2Y$, where Y=O, CH$_3$N, and $(CH_3)_2Si(OCH_2CH_3)_2$. It has been shown that increase in the coordination number of the silicon atom leads to an increase in its positive charge, and that this increase may be reduced by N→Si interaction. (19 refs.)

66028 **Quantum-chemical calculation of NMR chemical shifts.** P.V.Schastnev, A.A.Cheremisin (Inst. of Chem. Kinetics & Combustion, Acad. of Sci., USSR).

J. Struct. Chem. (USA), vol.23, no.3, p.440-62 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.139-70 (May-June 1982). [received: Feb. 1983]

The present review deals with various aspects of the problem of chemical shift and nonempirical and semi-empirical methods of calculation. Most attention is paid to questions of fundamental importance and to the discussion of methods which are promising from the viewpoint of application to molecules with fairly large dimensions, most important at the present time. (178 refs.)

66029 **Nuclear magnetic resonance studies of transition-metal complexes of ethylenediaminetetra-acetic acid (EDTA) in aqueous solution.** J.Oakes, E.G.Smith (Port Sunlight Lab., Unilever Res., Bebington, England).

J. Chem. Soc. Faraday Trans. I (GB), vol.79, no.2, p.543-52 (Feb. 1983).

The structures of EDTA complexes of transition-metal ions in aqueous solution have been investigated by NMR. Whereas complexes with Fe^{3+} and Mn^{2+} possess a single water molecule in their coordination spheres, the coordination number of water in complexes of Co^{2+}, Ni^{2+} and Cu^{2+} are 0.19, 0.33 and 0.38, respectively. These are interpreted in terms of a dynamic equilibrium between two complexes one containing hexa-coordinate EDTA and the other penta-coordinate EDTA. It appears that the predominant solution structures adopted by these complexes are similar to those determined for the crystals. Although the coordinated water becomes replaced by a hydroxyl group for the EDTA complex of Fe^{3+} above pH 7, this did not occur for complexes of divalent ions below pH 10. (26 refs.)

66030 **^{31}P NMR study of the inclusion of organophosphorus molecules in cyclodextrins.** Bo-Long Poh (School of Chem. Sci., Univ. Sains Malaysia, Penang, Malaysia), W.Saenger.

Spectrochim. Acta Part A (GB), vol.39A, no.4, p.305-7 (1983).

The upfield shift of the ^{31}P NMR signal of diethylethylphosphonate and dimethylphenylphosphine oxide in the presence of cyclodextrins in water is interpreted in terms of inclusion complex formation between the cyclodextrins and the organophosphorus molecules. The P=O group is closer to the solvent medium than to the interior of the hydrophobic cavity of the cyclodextrins in the complexes studied. (14 refs.)

33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

66031 **Structure and photodecomposition reactions of cations of cyclopentane, cyclohexane, cyclic olefines and dienes in γ-irradiated frozen solutions of CF_3CCl_3. An ESR study.** M.Tabata, A.Lund (Studsvik Sci. Res. Lab., Nykoping, Sweden).

Chem. Phys. (Netherlands), vol.75, no.3, p.379-88 (15 March 1983).

ESR studies of cyclopentane, cyclohexane, cylopentene, cyclohexene, 1,4- and 1,3-cyclohexadiene cations have been performed in order to elucidate their structures and their reactions, particularly those induced by visible light. The cations were generated by irradiation at 77K of the solutes contained in a CF_3CCl_3 matrix. At low temperature (6K) to the cylopentane cation has a low (C_s) symmetry characterized by $a=22.4$ G (2H). At higher temperature (113K) all ten hydrogens interact equally with $a=6.3$ G. The cyclohexane cation has $a=43$ G (6H) at 141K characteristic of a chair form with $\rho=0.085$ on each of the six equatorial hydrogen atoms. The cyclohexane cation undergoes a dehydrogenation reaction under the action of visible light resulting in the formation of the cyclohexene cation. New reaction mechanisms are proposed for this case and for the decomposition of the unsaturated hydrocarbon cations under study. (19 refs.)

66032 **Further measurement and analysis of lines in the LMR spectrum of HCO at 5.3 μm.** I.M.Brown, K.Dumper (Southampton Univ., Southampton, England), R.S.Lowe.

J. Mol. Spectrosc. (USA), vol.97, no.2, p.441-8 (Feb. 1983).

Lines in the infrared spectrum of the HCO radical have been studied previously by laser magnetic resonance (LMR) spectroscopy at wavelengths of 5 μm (Brown et al., 1980) and 10 μm (Jones et al., 1977). There are two fundamental bands involved, the CO stretch ν_2 and the bending vibration ν_3, respectively. Parts of the shorter wavelength spectrum in particular were very congested and it was not possible to make detailed assignments in such regions. The authors report new observations and revised measurements of the 5.3-μm spectrum of HCO. The spectra have been recorded at the National Research Council, Ottawa, with a spectrometer in which the molecules are generated within the laser cavity. The new spectra have better signal-to-noise ratios and many of the lines show saturation or Lamp dips. The latter feature has not only improved the precision of measurement but also helped to resolve individual features in the crowded regions. The laser tube was of the sealed-off type, permitting the use of different isotopic forms of carbon monoxide.

The resulting laser lines gave access to additional transitions in the ν_2 band of HCO. (9 refs.)

66033 The ^{13}C hyperfine splittings in ESR spectra of prop-2-ynyl and 1-(trimethylsiloxy)prop-2-ynyl radicals. J.C.Walton (Dept. of Chem., Univ. of St. Andrews, Fife, Scotland).
J. Magn. Resonance (USA), vol.52, no.2, p.241-6 (April 1983).
The ^{13}C satellite lines were observed in the 9.4 GHz ESR spectra of prop-2-ynyl and 1-trimethylsiloxyprop-2-ynyl radicals generated from precursors containing ^{13}C in natural abundance. The ^{13}C HFS indicate that prop-2-ynyl radicals adopt the π-delocalized structure, not the σ-allenyl form. The HFS of 1-trimethylsiloxyprop-2-ynyl radicals indicate that there is appreciable delocalization of spin onto the trimethylsiloxy group and that the radical is essentially planar at C(1). A linear correlation of a(C) with a(H) is shown to hold for a number of neutral hydrocarbon π-delocalized radicals. The experimental HFS are compared with spin densities calculated by a variety of semiempirical and ab initio SCF MO methods. (24 refs.)

66034 Study of the radical-cations of triethylamine and benzene derivatives by the optical detection of the EPR spectra of radical-ion pairs. V.M.Grigoryants, O.A.Anisimov, Yu.N.Molin (Inst. of Chemical Kinetics & Combustion, Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.327-33 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.4-10 (May-June 1982). [received: Feb. 1983]
The ODEPR method has been used to obtain the spectra of the radical-cations of hexamethylbenzene, durene, para-xylene, in triethylamine and non-polar liquid solutions at different temperatures, including temperatures close to room temperature. The values of the HFS constants of the radical-cations whose spectra have been recorded for the first time (para-xylene and triethylamine) have been found to be close to the theoretically calculated values. (21 refs.)

66035 Complexes of a stable nitroxyl radical with hydroxyl-containing molecules in frozen solutions. S.A.Dikanov, A.V.Astashkin, Yu.D.Tsvetkov (Inst. of Chemical Kinetics & Combustion, Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.333-45 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.11-25 (May-June 1982). [received: Feb. 1983]
An analysis of modulation effects in the electron spin echo has shown that the nitroxyl 2,2,6,6-tetramethylpiperidine-1-oxyl radical forms complexes with hydroxyl-containing molecules in frozen vitreous solutions. A method has been developed for separating the contribution to the modulation from the nuclei of the molecules of the complex. Numerical calculations have been carried out to determine the parameters of the complexes which can describe the observed modulation effects. (13 refs.)

66036 Rotational correlation times and radii of dithiazol-2-yl and dithiazolidin-2-yl free radicals. S.A.Fairhurst, R.S.Pilkington, L.H.Sutcliffe (Donnan Chem. Lab., Univ. of Liverpool, Liverpool, England).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, no.2, p.439-52 (Feb. 1983).
1,3,2-dithiazol-2-yl and 1,3,2-dithiazolidin-2-yl radicals have been shown to be useful model compounds for detailed ESR studies of rotational reorientation in liquid and frozen media. Consequently they are also potentially useful spin probes and spin labels. The ESR powder spectra have been analyzed and the resulting g and A tensors were used to calculate rotational diffusion correlation times, rotational energetics of activation and effective radii. The latter are a closer match to radii calculated from geometric radii than has been found for model nitroxy radicals: the energetics of activation for rotational diffusion indicate that the non-polar character of the radicals minimises solute-solvent interactions. (28 refs.)

66037 Analysis of the ESR hyperfine coupling in mono- and bicyclic azine radical anions by means of calculated spin densities. M.H.Palmer, I.Simpson (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.415-27 (April 1983).
Ab initio studies of the spin density in mono- and bicyclic N hetero-aromatic compounds and naphthalene are reported. The wave functions were constructed from both minimal and double zeta bases in all cases, and both RHF and UHF formalisms were used together with quartet annihilation. The statistical variations in correlations between spin population density and hyperfine coupling are investigated. After annihilation the MB and DZ wave functions become relatively similar, but do lead to some differences in assignment for the smaller values of a_H. In general the agreement between a_H/a_N and calculated density is improved by two term rather than one term expressions, but there are still a number of experimental hyperfine couplings awaited. (77 refs.)

66038 ESR of cation radicals of methyl-substituted benzenes in a CF_3CCl_3 matrix. M.Tabata, A.Lund (Studsvik Sci. Res. Lab., Nykoping, Sweden).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.428-33 (April 1983).
A new matrix, 1,1,1-trifluorotrichloroethane, CF_3CCl_3, has been employed in radiation chemistry studies to stabilise positive ions. As a test, positive ions of benzene, toluene, ortho-, meta-and paraxylene and biphenyl have been generated by γ-irradiation of the solutes contained in the CF_3CCl_3 matrix at 77K. The ions have been investigated by ESR, and hyperfine couplings have been obtained. The data complement and correct the splitting values obtained previously in the adsorbed state. (33 refs.)

66039 Infrared-microwave double-resonance probing of the population-depopulation of rotational states in the NO_2 molecule. B.Khoobehi, J.A.Roberts (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.227-33 (Feb. 1983).
A 10.6-μm CO_2 laser operating over a power range $5 \leq p \leq 135$ watts was used to pump some select vibrational transitions in the NO_2 molecule while monitoring the rotational transitions $(9_{1,9} \rightarrow 10_{0,10})$, $(23_{2,22} \rightarrow 24_{2,23})$, and $(40_{2,38} \rightarrow 39_{3,37})$ in the (0, 0, 0) vibrational level and the $(8_{0,8} \rightarrow 7_{1,7})$ rotational transition in the (0, 1, 0) vibrational level. These rotational transitions were monitored by microwave probing to determine how the population of states in the rotational manifolds was being altered by the laser. Coincidences between some components of the ν_3-ν_2 band of NO_2 and the CO_2 infrared laser lines in the 10-μm region appeared to be responsible for the strong interaction between the continuous laser beams and the molecular states. Characteristic rate curves for population-depopulation changes in the chosen rotational levels listed above were found for various power levels from the laser pump. Rate coefficients for intensity decay for various laser powers were calculated from experimental data and are presented. (11 refs.)

66040 The lowest ^3E_u state of a metalloporphine in a crystal field of low symmetry. Directions of the stationary fields for electron spin resonance and phosphorescence Zeeman experiments. W.A.J.A.van der Poel, A.M.Nuijs, M.Noort, J.H.van der Waals (Center for the Study of the Excited States of Molecules, Huygens Lab., Univ. of Leiden, Leiden, Netherlands).
J. Phys. Chem. (USA), vol.86, no.26, p.5191-7 (23 Dec. 1982).
When a metalloporphine is excited to its lowest ^3E_u state in a crystalline environment of low symmetry the orbital degeneracy is removed. Expressions are derived for (1) the in-plane stationary directions for the ESR transitions between the three spin components of the lower orbital state in a magnetic field and (2) the in-plane stationary directions of the relative intensity I_O/I_1, of the two Zeeman components in the phosphorescence with $\Delta m=0,1$. The two pairs of axes do not coincide, unless the simple Jahn-Teller plus crystal field model holds in which the molecule in its phosphorescent state retains two of its ground-state in-plane twofold axes. 33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

66041 Shift of emission band upon excitation at the long-wavelength absorption edge. Time-dependent fluorescence shift of a fluid ethanol solution of 6-methoxyquinoline. T.Ikeyama, T.Azumi (Dept. of Chem., Faculty of Sci., Tohoku Univ., Sendai, Japan), T.Murao, I.Yamazaki.
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.419-21 (15 April 1983).
The fluorescence spectrum of 6-methoxyquinoline in fluid ethanol solution at 294K shifts progressively to the red with time. The results are discussed in connection with the excitation-energy-dependent fluorescence shift previously studied. (13 refs.)

66042 Two-photon laser-induced fluorescence studies of HS radicals, DS radicals, and I atoms. J.J.Tiee, M.J.Ferris, G.W.Loge, F.B.Wampler (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.422-5 (15 April 1983).
A two-photon laser-induced excitation and fluorescence technique has been used to study the $A^2\Sigma^+$-$X^2\Pi$ transition of HS and DS radicals and various high-lying $^4P^0$, $^2D^0$, and $^4D^0$ states of the I atom. The two-photon excitation cross sections and detection sensitivity are discussed. (13 refs.)

66043 Photochemistry of benzophenone in micelles. Phosphorescence emission from aromatic ketones in micellar solution. W.J.Leigh, J.C.Scaiano (Div. of Chem., Nat. Res. Council, Ottawa, Ontario, Canada).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.429-32 (15 April 1983).
Benzophenone phosphoresces in sodium dodecyl sulfate and other micelles at room temperature and the spectrum approaches that observed in hydrocarbon solution and/or glasses at 77K. (22 refs.)

66044 Picosecond fluorescence decay kinetics of crystal violet in low-viscosity solvents. T.Doust (Davy Faraday Res. Lab., Royal Inst., London, England).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.522-5 (22 April 1983).
Picosecond fluorescence techniques have been used to study the viscosity-dependent non-radiative decay rates of crystal violet in low-viscosity solvents. Dual-exponential behaviour is observed in all cases with anomalous behaviour in diols. The data are interpreted in terms of recent models of radiationless decay mediated by conformational relaxation. (12 refs.)

66045 **The phosphorescent state of γ-thiopyrones: optically-resolved zero-field splittings.** M.R.Taherian, A.H.Maki (Dept. of Chem., Univ. of California, Davis, CA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.541-6 (22 April 1983).

The phosphorescence spectra, ODMR, and triplet sublevel kinetics are reported for the thioketones, 4H-pyran-4-thione (PT) and 2,6-dimethyl-4H-pyran-4-thione (DMPT). Extremely large ZFS parameters, $D=-24$, and $-28\ \mathrm{cm}^{-1}$, are assigned to two distinct trap sites of PT in *n*-pentane and $D=-24\ \mathrm{cm}^{-1}$ for the major site of DMPT in *n*-hexane. (19 refs.)

66046 **A compact synchroscan streak camera using a microchannel plate incorporated tube.** M.Yamashita (Laser Res. Section, Electrotech. Lab., Ibaraki-ken, Japan), T.Honda, T.Sato, K.Aizawa.

IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.124-6 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).

A compact synchroscan streak camera, which incorporates microchannel plates providing a high light gain, has been constructed. The camera has been operated in synchronism with a synchronous-passive hybrid mode-locked CW dye laser, and the overall time resolution has been 10.8 and 25.9 ps for a recording of ~ 160 and $\sim 10^8$ cycles of dye laser pulses, respectively. By using the camera system with the dye laser a weak fluorescence profile (a quantum yield of $\sim 10^{-3}$) of an important biomolecule has been directly observed on a picosecond time scale. (10 refs.)

66047 **Variation of dipole moments with triplet state energy spacings in substituted benzaldehydes.** I.C.Winkler, D.M.Hanson (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA).

J. Chem. Phys. (USA), vol.78, no.8, p.4836-9 (15 April 1983).

Recent studies of the Stark effect on bands in the laser induced phosphorescence excitation spectrum of 2,4,5-trimethylbenzaldehyde, isolated in a durene single crystal, revealed that the dipole moment associated with the most intense feature in the spectrum, believed to arise from the $T_2(n\pi^*)$ state, was the same within experimental uncertainty as that for the $T_1(\pi\pi^*)$ origin. This result may indicate that the $T_2(n\pi^*)$ state is strongly coupled to a set of nearby $T_1(\pi\pi^*)$ vibronic levels. In order to evaluate the effect of the density of $\pi\pi^*$ vibronic levels on the dipole moment of the $T_2(n\pi^*)$ state, the authors have made similar measurements on 2,4- and on 2,5-dimethylbenzaldehyde. They have found that as the T_1-T_2 energy spacing decreases, the dipole moment of the second triplet state becomes more characteristic of an $n\pi^*$ state. (12 refs.)

66048 **Photophysical properties of benzimidazole and thiabendazole and their homologues. Effect of substituents and solvent on the nature of the transition.** P.C.Tway, L.J.Cline Love (Dept. of Chem., Seton Hall Univ., South Orange, NJ, USA).

J. Phys. Chem. (USA), vol.86, no.26, p.5223-6 (23 Dec. 1982).

The photophysical characteristics of benzimidazole and thiabendazole, and ten of their derivatives, are evaluated to determine the nature of the transitions occurring and how the excited states interact with the species microenvironment. On the basis of the fluorescence and phosphorescence energies, quantum yields, and lifetimes, these benzimidazole homologues appear to be excited to a manifold of single states. Which excited state predominates, either $\pi \leftarrow \pi^*$ or charge transfer, depends on the side-chain substituent, solvent system, pH, and temperature. (22 refs.)

66049 **Temperature dependence of the fluorescence lifetime of benzene in cryogenic solutions.** F.Li, J.Lee, E.R.Bernstein (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).

J. Phys. Chem. (USA), vol.87, no.2, p.254-60 (20 Jan. 1983).

Fluorescence lifetimes for C_6D_6 in various hydrocarbon solvents have been measured as a function of concentration and temperature. For the solvents ethylene, ethane, and propane it is found that at low concentrations (~ 0.3 ppm or $\sim 4\times 10^{-6}$ mol/L) the fluorescence lifetime is roughly temperature independent ($90 \leq T \leq 220$K) and equal to the gas-phase value of ~ 150 ns. As the concentration is increased ($1 \leq c \leq 100$ ppm), the lifetime decreases as temperature is increased, reaching a minimum value at about 150K of roughly 70-100 ns, depending on the concentration. As the temperature is increased from 150 to 220K, the lifetime increases to well over 100 ns. (16 refs.)

66050 **Spectroscopic studies of pyrazine in cryogenic solutions.** J.Lee, F.Li, E.R.Bernstein (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).

J. Phys. Chem. (USA), vol.87, no.2, p.260-5 (20 Jan. 1983).

The first excited singlet ($^1B_{3u}$) and triplet ($^3B_{3u}$) states of pyrazine are studied in the cryogenic liquids CH_4, C_2H_6, C_3H_8, C_4G_{10}, C_2H_4, C_3H_6, and 1-C_4H_8. The reported data include $^1B_{3u} \rightleftharpoons {}^1A_{1g}$ absorption, fluorescence, and lifetimes and $^3B_{3u} \rightarrow {}^1A_{1g}$ phosphorescence and lifetimes as a function of temperature and concentration. From the behavior of the $^1B_{3u} \rightleftharpoons {}^1A_{1g}$ system it is concluded that hydrogen bonding is an important feature of the intermolecular potential in these solutions. (17 refs.)

66051 **Lowest excited singlet state of hydrogen-bonded methyl salicylate.** L.A.Helmbrook, J.E.Kenny, B.E.Kohler, G.W.Scott (Dept. of Chem., Wesleyan Univ., Middletown, CT, USA).

J. Phys. Chem. (USA), vol.87, no.2, p.280-9 (20 Jan. 1983).

The dual fluorescence shown by methyl salicylate in solution and the room temperature vapor phase has been observed for methyl salicylate seeded in a supersonic helium jet. Under these conditions low rotational and vibrational temperatures are attained, making it possible to measure highly resolved excitation spectra for each of the emission components. The measurement of these excitation spectra is reported together with emission spectra and emission decay kinetics as a function of excitation wavelength for both methyl salicylate-*h* and methyl salicylate-*d* in a supersonic jet. The measured spectra are analyzed to determine the nature of the excited states responsible for the dual emission. (37 refs.)

66052 **Quantum beats in the fluorescence of jet-cooled SO_2 ($\tilde{A}^1A_2$) under a weak magnetic field.** H.Watanabe, S.Tsuchiya (Dept. of Pure & Appl. Sci., Univ. of Tokyo, Meguro-ku, Tokyo, Japan), S.Koda.

J. Phys. Chem. (USA), vol.87, no.6, p.906-8 (17 March 1983).

The fluorescence from $SO_2(\tilde{A}^1A_2)$ in a single ro-vibronic level, which is formed through the $^rR_0(0)$ transition of the 'E' band absorption of jet-cooled SO_2, shows a beating decay under an applied weak magnetic field. The polarization of the beating fluorescence and its frequency as a function of the magnetic field strength can be analyzed on the basis of the theory of time-dependent level crossing spectroscopy. It was shown that this particular rotational level of the upper electronic state ($^1A_2$) possesses an anomalously high magnetic moment ($g_J=0.14$) through intramolecular couplings among the relevant electronic states. (13 refs.)

66053 **Effects of molecular rotation on electronic relaxation processes in pyrazine and pyrimidine with particular regard to pressure dependence.** H.Baba, N.Ohta, O.Sekiguchi, M.Fujita, K.Uchida (Div. of Chem., Hokkaido Univ., Sapporo, Japan).

J. Phys. Chem. (USA), vol.87, no.6, p.943-52 (17 March 1983).

Fluorescence quantum yields and decays have been measured along the rotational contour of the O-O band in the $S_1 \leftarrow S_0$ absorption of pyrazine and pyrimidine in the vapor phase at different pressures. The results are discussed on the basis of a kinetic model and of a quantum-mechanical treatment of the intermediate case with emphasis on the role of rotational levels in S_1-T coupling and in collisional quenching of fluorescence. In each molecule, the fluorescence quantum yield spectrum at low pressure exhibits a sharp peak near the band origin. As the pressure increases, the peak becomes less pronounced, and the yield spectrum is rather flat at moderately high pressure, indicating that the marked rotational-level dependence of the quantum yield is attributable mainly to the slow component of fluorescence. It is shown that the rotational relaxation leads predominantly to quenching of the slow fluorescence. (31 refs.)

66054 **Application of the energy gap law to nonradiative, excited-state decay.** J.V.Caspar, T.J.Meyer (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA).

J. Phys. Chem. (USA), vol.87, no.6, p.952-7 (17 March 1983).

As predicted by the energy gap law, which can be used to relate excited-state, nonradiative decay rate constants (k_{nr}) and emission energies (E_{em}), the authors show that plots of ln k_{nr} vs. E_{em} are linear for (1) the MLCT excited states in the series $Re(bpy)(CO)_3L^+$ (bpy is 2,2′-bipyridine; $L=PMe_3$, CH_3CN, ...); (2) the d-d excited states in the series $Rh(NH_3)_5L^{3+}$ ($L=CH_3CN$, py, ...); (3) solvent effects for π-π^* fluorescence from 6-hydroxy-9-phenylfluoron and fluorescein; (4) the dσ^*-σp excited states of the dimers $Rh_2(CNR)_4(AA)_2$ (AA=bis(diphenylphosphino)methane or bis(diphenylarsino)methane). (20 refs.)

66055 **Statistical limit of S_1 pyrimidine quenching.** G.Loge (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

J. Phys. Chem. (USA), vol.87, no.6, p.969-72 (17 March 1983).

An approximate quantum theory previously used to explain biexponential decay of intermediate-case excited-state molecules is used to explain an experimentally observed nonlinear pressure dependence of collision-induced-state crossing in intermediate-case nonradiative transitions. The inverse of the fluorescence yield derived from this model is fitted to experimentally obtained quenching data for the lowest vibrational level of S_1 pyrimidine, which crosses to the T_1 state with nearly small-molecule behavior but with some biexponential behavior. O_2 and NO used as added gases showed somewhat different quenching behavior than the other added gases, reaching a higher statistical limit. (19 refs.)

66056 **Correspondence between rotational relaxation and collision-induced intersystem crossing in S_1 pyrimidine.** A.E.W.Knight (School of Sci., Griffith Univ., Brisbane, Queensland, Australia), J.T.Jones, C.S.Parmenter.

J. Phys. Chem. (USA), vol.87, no.6, p.973-83 (17 March 1983).

Measurements are presented of the absolute rate constants for collision-induced crossing (CIC) from S_1 to triplet pyrimidine vapor when either S_0 pyrimidine or added gases (He, Ne, CO, C_6H_{12}, trans-$C_2H_2Cl_2$, cis-$C_2H_2Cl_2$) serve as collision partners. Data are secured for crossing from each of four initial S_1 levels with $\varepsilon_{vib} \leq 1012\ \mathrm{cm}^{-1}$. The collisional efficiencies range from 0.8 to 7.5 for the 0^0level and are largely unchanged for each of the higher levels. The perturbed-state model of CIC by W.M. Gelbart and K.F. Freed (1973) is obtained in a form useful for explicit comparisons of data. The data correspond closely with the model in a version that links CIC with rotational but not vibrational relaxation within the triplet manifold. A new measurement establishes the zero-pressure S_1 fluorescence yield from the 0^0 level as 0.38. (45 refs.)

66057 **Laser-induced fluorescence and inelastic collisions of KH molecule.** A.Pardo, J.M.L.Poyato, M.S.Guijarro, J.I.Fernandez-Alonso (Dept. de Quimica Fisica y Quimica Cuantica, Univ. Autonoma de Madrid, Madrid, Spain).

J. Mol. Spectrosc. (USA), vol.97, no.2, p.248-52 (Feb. 1983).

The laser-induced fluorescence spectrum of KH vapor, excited by the 4881-Å argon ion laser line, was obtained and analyzed. The transition was found to involve the $A^1\Sigma^+$ and $X^1\Sigma^+$ states. Vibrational and rotational energy transfer is detected. The spectrum presents a clear differentiation of bandheads. The molecular constants obtained are in good agreement with the previously reported data. (11 refs.)

66058 **The identification of the $b^3\Pi$ state of copper monofluoride.** C.R.Brazier, J.M.Brown (Southampton Univ., Southampton, England), T.C.Steimle.

J. Mol. Spectrosc. (USA), vol.97, no.2, p.449-53 (Feb. 1983).

The authors recently reported on the yellow system of bands in the electronic spectrum of CuF, recorded at Doppler-limited resolution by laser-induced fluorescence. This work was prompted by an earlier study by Ahmed et al. (1982), who had found that the system consisted of two subbands, involving transitions from the ground $^1\Sigma^+$ state to excited levels with $\Omega=0^+$ and 1 about 55 cm^{-1} apart. It was possible to interpret the upper state either as a *p* complex, that is, a $^1\Sigma^+$ and $^1\Pi$ state lying close together or as a $^3\Sigma^-$ state with a large spin-spin splitting. The initial aim of the present work was to observe and measure nuclear hyperfine structure in the hope that such observations would favor one assignment over the other. In the event, the splittings due to the ^{63}Cu nucleus ($I=3/2$) were large enough to be observable even at Doppler-limited resolution in the $\Omega=0^+$ and 1^+ subbands for *J* values above about 20. However, the authors were able to fit the structure equally well to either of the proposed electronic models. Indeed, more careful investigation revealed that the exact equivalence between the spin and rotational levels of a *p* complex and of a $^3\Sigma^-$ state extended through to the hyperfine structure as well. Subsequently, the authors have obtained additional information on the hyperfine interactions with two sub-Doppler techniques, intermodulated fluorescence (IMF) and microwave optical double resonance (MODR). (10 refs.)

66059 **Highly resolved electronic spectra and electronic structure of benzo[f]quinoxaline.** K.Brenner, J.Lipinski, Z.Ruziewicz (Inst. of Organic & Phys. Chem., Tech. Univ., Wroclaw, Poland).

J. Lumin. (Netherlands), vol.28, no.1, p.13-26 (March-April 1983).

Vibrational analysis of highly resolved phosphorescence (P), fluorescence (F) and absorption spectra of bonzo[f]quinoxaline (BQ) in Shpolskii matrices, at 77K, was carried out. The spectra were dominated by phenanthrene-type fundamental vibrations. The appearance of several out-of-plane (op) modes in the P spectrum as well as the P lifetime, much shortened relative to that of the parent hydrocarbon, point to the proximity of the lowest n, π^* and π, π^* states of the BQ molecule. High activity of op modes in the F spectrum and complex structure of the absorption spectrum onset have been examined in terms of the pseudo-Jahn-Teller interaction between close-lying S_1 (π, π^*) and S_2(n, π^*) states. According to calculations of the BQ electronic structure, performed using a modified INDO CI method, the $T_1(\pi, \pi^*)$-$T_2(\mathrm{n}, \pi^*)$ and

$S_1(\pi, \pi^*)$-$S_2(n, \pi^*)$ energy gaps are about 1200 and 700 cm^{-1}, respectively. (34 refs.)

66060 Highly resolved electronic absorption and luminescence spectra of some phenanthrolines in Shpolskii matrices. II. Fluorescence and $S_1 \leftarrow S_0$ absorption spectra. H.Basara (Inst. of Organic & Phys. Chem., Tech. Univ., Wroclaw, Poland).
J. Lumin. (Netherlands), vol.28, no.1, p.73-86 (March-April 1983).
For pt.I see ibid., vol.17, p.283 (1978). Highly resolved fluorescence and $S_1 \leftarrow S_0$ absorption spectra of some phenanthrolines in *n*-alkane matrices were obtained at 77K. The vibrational analysis of the spectra was carried out. Mirror symmetry distortions of the fluorescence and absorption spectra were attributed to vibronic coupling between $^1(\pi, \pi^*)$ states. It was shown that vibronic mixing of $S_1(\pi, \pi^*)$ and $S_2(\pi, \pi^*)$ states occurs in phenanthroline molecules with S_1-S_2 energy gap not exceeding 3000 cm^{-1} (i.e. 4,7-, 1,7- and 1,10-Phen), whereas in other phenanthrolines the coupling of S_1 and $S_3(\pi, \pi^*)$ plays a dominant role. Fluorescence quantum yields of phenanthroline liquid solutions were measured. Changes of luminescence efficiencies due to the change of the polarity of the media point to a weak coupling of the lowest $^1(\pi, \pi^*)$ and $^1(n, \pi^*)$ states. (23 refs.)

66061 Fluorescence excitation spectra of jet-cooled amino-phthalimides. M.Asimov, N.P.Ernsting (Max-Planck-Inst. fur Biophys. Chem., Gottingen, Germany).
J. Lumin. (Netherlands), vol.28, no.1, p.119-21 (March-April 1983).
Reports the fluorescence excitation spectra of the $\pi\pi^*$ transition of jet-cooled 3-amino-, 3-amino-N-methyl-, and 4-amino-N-methyl-phthalimide. The spectra are dominated by a long progression of a vibrational mode $\nu' \approx 210$ cm^{-1} in combination with a few vibrational fundamentals of the excited state. The long electronic lifetimes and structural diversity of these compounds make them ideally suited for the study of intramolecular vibronic relaxation. (6 refs.)

66062 Possibility of the investigation of conformational changes in protein molecules with fluorescent probes in the picosecond time range. V.P.Mikhailov, M.I.Demchuk, K.V.Yumashev.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.777-80 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.60-4 (July 1982). [received: March 1983]
From an investigation of transport proteins in human blood the authors conclude that the method of fluorescent probes in the picosecond time range can be used successfully both for studying the structural states of protein molecules and for studying the dynamics of the behavior of water-protein systems. (7 refs.)

66063 Spectral-kinetic properties of the delayed fluorescence of complex molecules with inhomogeneously broadened energy levels. S.K.Gorbatsevich, I.M.Gulis, A.I.Komyak, Yu.I.Miksyuk.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.804-8 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.92-7 (July 1982). [received: March 1983]
A study is presented of the manifestation of inhomogeneous broadening of the levels in the spectral and kinetic characteristics of delayed emission from complex molecules, i.e. processes which involve the triplet states. The systems studied were solid films of polyvinyl alcohol containing acridine dyes which exhibit both phosphorescence as well as delayed fluorescence (at room temperature). (18 refs.)

66064 Dependence of selectively excited fine-structure fluorescence spectra of organic molecules on the wavelength of the exciting light. K.N.Solovev, I.V.Stanishevskii, A.S.Starukhin, A.M.Shulga.
Opt. & Spectrosc. (USA), vol.53, no.3, p.230-1 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.389-92 (Sept. 1982). [received: May 1983]
Investigates fine-structure spectra at 4.2K with selective laser excitation for four metalloporphyrins, which by virtue of asymmetry due either to side substituents or attachment of extraligands, have had their twofold degeneracy of the lowest singlet excited level removed, of which polarization measurements provide evidence. The interval S_1-S_2 of the chosen objects of investigation acquired values from 80 to 400 cm^{-1}. It appears to the authors that the basic cause of the nonidentical nature of the intervals S_0-S_1 for the types of center selectively excited in the $S_0 \rightarrow S_2$ path is the difference in orientation of the moments of $S_0 \rightarrow S_1$ electronic transitions of impurity centers having identical intervals S_0-S_2 in relation to the solvent molecules. (5 refs.)

66065 Nuclear-motion randomization and hot-luminescence spectra of complex molecules. V.L.Bogdanov, V.P.Klochkov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.233-4 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.394-6 (Sept. 1982). [received: May 1983]
Reports the results of a study using the hot luminescence (HL) method. The authors have investigated the intramolecular redistribution of vibrational energy Q in complex molecules and the dependence of this phenomenon on the temperature and the solvent. The HL of the perylene molecule for which a value of Q was given has been studied. The concentration of the solutions was $\sim 10^{-5}$ M. HL is observed in the anti-Stokes region of the spectrum when the ν_2 photon is absorbed. The shape of the spectrum essentially depends on the state of the solvent and the temperature. It follows from the data obtained that the rate of establishment of the intramolecular equilibrium distribution in the region of randomization depends on the properties and state of the medium. It increases on transition from a Shpolskii matrix to solid alcohol and to liquids at room temperature. Excitation of all modes for the systems investigated proceeds at rates that are significantly faster than the rates of establishment of an equilibrium distribution. (8 refs.)

33.65 PHOTOELECTRON SPECTRA

66066 The electron angular distribution of different rotational branches in the VUV photoelectron spectrum of H_2. M.-W.Ruf, T.Bregel, H.Hotop (Fachbereich Phys. Univ. Kaiserslautern, Kaiserslautern, Germany).
J. Phys. B (GB), vol.16, no.9, p.1549-64 (14 May 1983).
By high-resolution photoelectron spectrometry using a cooled $H_2(\nu''=0, J''=0,1)$ target beam, the authors have determined the relative intensities of the Q and S rotational branches for several $H_2^+(\nu')$ vibrational states at photon wavelengths of 58.4, 73.6 and 74.4 nm. From results measured at different angles between the direction of the unpolarised photon beam and the momentum of the ejected electrons, they have determined the angular anisotropy parameter β_s for S-branch electrons ($\Delta J=2$ transitions), and find (e.g. for $\nu'=0$) $\beta_s(58.4 \text{ nm})=0.81(17)$, $\beta_s(73.6 \text{ nm})=0.54(16)$ and $\beta_s(74.4 \text{ nm})=0.76(27)$. These data show that at photoelectron energies of 5 eV and 1 eV the contribution due to f-electron waves cannot be ignored. A search for $\Delta J=4$ transitions at 58.4 nm has yielded an upper limit of 0.3% with respect to the $\Delta J=0$ partial cross section. (34 refs.)

66067 Shape resonance phenomena in CO following *K*-shell photoexcitation. C.M.Truesdale, S.H.Southworth, P.H.Kobrin, U.Becker, D.W.Lindle, HG.Kerkhoff, D.A.Shirley (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1265-8 (25 April 1983).
Electron cross sections and asymmetries following photoexcitation of the CO *K* shells were measured directly. Energy analysis of ejected electrons yielded cross sections exhibiting σ shape resonances in the $C(1s)$, $C(KVV)$, and $O(1s)$ channels, and a π resonance in the $C(KVV)$ channel, confirming earlier indirect measurements. Asymmetry measurements showed a σ shape resonance in the $C(1s)$ channel, in good agreement with the predictions of Dehmer and Dill (1977). The $C(KVV)$ π resonance showed nearly isotropic behavior. (16 refs.)

33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

66068 The absorption and circular dichroism bandshapes of chromophore aggregates as studied by a modified Green's function theory. M.Kamiya (Lab. of Phys. Chem., Shizuoka Coll. of Pharmacy, Shizuoka-shi, Japan).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.569-74 (22 April 1983).
A modified Green's function method is applied to calculating the aggregate bandshape whereby a decoupling approximation for vibrationally averaging the Green's function is used to include thermal and static effects as well in terms of the correction shift of the chromophore bandshape. The utility of the method is shown by a sample calculation of the absorption and circular dichroism bandshapes of a model dimer. (12 refs.)

66069 Linear dichroism studies of flavins in stretched poly(vinyl alcohol) films. Molecular orientation and electronic transition moment directions. Y.Matsuoka, B.Norden (Inst. of Phys. Chem., Chalmers Univ. of Technol., Gothenburg, Sweden).
J. Phys. Chem. (USA), vol.87, no.2, p.220-5 (20 Jan. 1983).
Linear dichroism of 3-methyllumiflavin (MLF) and riboflavin (RF) partially oriented in stretched poly(vinyl alcohol) (PVA) film was measured in the 220-530-nm region to determine the directions of the electronic transition moments. IR dichroism was measured in the same stretched films in the region 1900-1500 cm^{-1} to obtain information about the molecular orientation tensor. The four important π-π^* transitions of 3-methyllumiflavin, with absorption at 448, 360, 270, and 225 nm in poly(vinyl alcohol) medium, were found to be polarized at the angles (counterclockwise direction) 50°, 74°, 90°, and 40° with respect to the N_5-N_{10} line. The corresponding transitions of riboflavin, occurring at 448, 365, 270, and 25 nm, were found at the angles 45°, 68°, 76°, and 39°, respectively. (32 refs.)

66070 Lifetime of electronic states of CO_2^+. C.Herran, F.Arqueros, J.Campos (Catedra de Fisica Atomica Experimental, Univ. Complutense, Madrid, Spain).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.244-7 (Feb. 1983).
The radiative lifetimes of the $\tilde{A}^2\Pi_u$ and $\tilde{B}^2\Sigma_u^+$ states of CO_2^+ were measured by means of the delayed coincidence method. Excitation was performed by a pulsed electron beam incident on CO_2. The results of these measurements are 115±5 nsec for the $\tilde{A}^2\Pi_u$ state and 126±3 nsec for the $\tilde{B}^2\Sigma_u^+$ state. (17 refs.)

66071 Direct retrieval of lineshape parameters: absolute line intensities for the ν_2 band of CH_3D. C.Chackerian,Jr., G.Guelachvili (Lab. d'Infrarouge, Univ. de Paris-Sud, Orsay, France).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.316-32 (Feb. 1983).
A nonlinear least-squares technique is applied to the ν_2 band of CH_3D to obtain lineshape parameters (intensity, position, and broadening). Some self-shift parameters are also reported. For the ν_2 band of $^{12}CH_3D$, line intensities with $J'' \leq 15$ and $K'' \leq 7$ are well represented with a squared vibrational transition dipole matrix element and 'Herman-Wallis' factor equal respectively to $(8.798 \pm 0.014) \times 10^{-4}$ $(\text{debye})^2$ and $F(m)=1+(0.0135 \pm 0.0004)$ m. Intensity parameters are also reported for the ν_2 band of $^{13}CH_3D$. Rough estimates are given for 'Herman-Wallis' factors for the *P* branches of the $2\nu_6$ transition of $^{12}CH_3D$. (24 refs.)

66072 Strengths and Lorentz broadening coefficients for spectral lines in the ν_3 and $\nu_2+\nu_4$ bands of $^{12}CH_4$ and $^{13}CH_4$. V.M.Devi, B.Fridovich, G.D.Jones, D.G.S.Snyder (Nat. Earth Satellite Service, NOAA, Washington, DC, USA).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.333-42 (Feb. 1983).
Line strengths and self- and nitrogen-broadened half-widths were measured for spectral lines in the ν_3 and $\nu_2+\nu_4$ bands of $^{12}CH_4$ and $^{13}CH_4$ from 2870-2883 cm^{-1} using a tunable diode laser spectrometer. From measurements made over a temperature range from 215 to 297K, on samples of $^{12}CH_4$ broadened with N_2, the authors deduced that the average temperature coefficients *n*, defined as $b_L^0(T)=b_L^0(T_0)(T/T_0)^{-n}$, of the Lorentz broadening coefficients for the ν_3 and $\nu_2+\nu_4$ bands of $^{12}CH_4$ were 0.97±0.03 and 0.89±0.04, respectively. A smaller increase is observed in line half-width with increasing pressure for *E*-species lines, for both self- and nitrogen-broadening, than for other symmetry species lines over the range of pressures measured, 70 to 100 Torr. (22 refs.)

66073 Collisional broadening of nitrous oxide transition lines in the $\nu_1+2\nu_2$ band by noble gases. A.H.M.Sondag, H.A.van der Liet, G.H.Wegdam (Lab. for Phys. Chem., Univ. of Amsterdam, Amsterdam, Netherlands).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.353-61 (Feb. 1983).
A tunable diode laser is used to measure the foreign gas broadening for several rotational states in the *R* branch of the 12^00-00^00 vibration-rotation band of N_2O. The results indicate that rotational relaxation is the chief pressure broadening mechanism. The resulting cross sections for He and Ne turn out to be almost independent of the rotational quantum number. Ar and Kr, however, show a clear dependency. This seems to contradict the results of the infinite order sudden approximation. (22 refs.)

66074 Theory of impact broadening of the rotational ammonia spectrum. A.I.Petrova, M.R.Cherkasov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.252-6 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.429-34 (Sept. 1982). [received: May 1983]
It is noted that collisional relaxation gives rise to interference between the components of the rotational doublets of the ammonia molecule, which leads to their correlated broadening. The corresponding model is introduced, and computational expressions for the entire set of collisional relaxation parameters are obtained. Specific computations are made for the case of self-broadening. A comparison of the computed values of halfwidths with experimental data is given. (16 refs.)

66075 Algorithm for evaluating Franck-Condon integrals. M.D.Elkin.
Opt. & Spectrosc. (USA), vol.53, no.3, p.335-6 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.566-7 (Sept. 1982). [received: May 1983]
Analysis of molecular electronic-vibrational spectra requires the development of reliable and effective computer methods for evaluating the overlap integrals of the vibrational wave functions. The authors describe an algorithm for evaluating Franck-Condon integrals, which is general and simple in computer implementation. (3 refs.)

66076 $B^1\Pi$-$X^1\Sigma$ and $C^1\Sigma$-$X^1\Sigma$ electron-transition strengths of the SrO molecule. I.A.Svyatkin, L.A.Kuznetsova, YuYa.Kuzyakov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.339-40 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.572-5 (Sept. 1982). [received: May 1983]
Reports a continuation of a study of the electron-transition strengths of molecules of alkaline earth oxides. On the spectrograms the authors observed bands corresponding to the transitions $B^1\Pi$-$X^1\Sigma$ and $C^1\Sigma$-$X^1\Sigma$ of the SrO molecule (λ=300-400 nm) and also two intense groups of bands in the yellow and red regions, which have tentatively been attributed to several singlet and triplet transitions of SrO and two transitions of SrOH. A quantitative analysis could be carried out only in the spectra of the *B*-*X* and *C*-*X* systems. Since these spectra lie in a wavelength region that overlaps the Schumann-Runge system ($B^3\Sigma_u^-$-$X^3\Sigma_g^-$) of oxygen, the authors used mixtures with a little oxygen as possible (O_2:Ar=1:5, 1:9) in an effort to suppress the effect of this oxygen system as much as possible. The calculated intensity of the oxygen absorption lines did not exceed 5-8% of the total intensity for any of the regions studied. (13 refs.)

33.80 PHOTON INTERACTIONS WITH MOLECULES

66077 Manifestations of the optical activity of molecules in the dipole photoeffect. N.A.Cherepkov (A.F. Ioffe Phys.-Tech. Inst., Leningrad, USSR).
J. Phys. B (GB), vol.16, no.9, p.1543-8 (14 May 1983).
The lack of a plane of symmetry in the structure of optically active molecules leads, even in the dipole approximation, to the appearance of five new terms in the angular distribution of photoelectrons with defined spin orientation ejected from unoriented molecules by circularly polarised light. The vector structure of these terms is presented, and the possibility of their detection is discussed. Photoionisation of oriented chiral molecules is also discussed briefly. (15 refs.)

33.80E Autoionization, photoionization, and photodetachment

66078 Photodissociation of partially solvated molecules in beams by the picosecond-jet technique: hydrogen bond breakage. P.M.Felker, A.H.Zewail (Arthur Amos Noyes Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5266-8 (15 April 1983).
The authors report the measurement of photodissociation rates of jet-cooled solute-solvent complexes in various stages of solvation. The observation of fluorescence decays as a function of excess vibrational energy for isoquinoline (IQ), IQ-(methanol)*n*, and IQ-(water)*n* complexes reveals threshold behaviour for the decay rates of 1:1 solute-solvent complexes. The thresholds at ~3 kcal/mol provide new information on the breakage of excited state hydrogen bonds. (7 refs.)

66079 Fe emission yield and photoionization of $Fe(CO)_5$ by vacuum-ultraviolet radiation. D.V.Horak, J.S.Winn (Materials & Molecular Res. Div., Lawrence Berkeley Lab., CA, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.265-71 (20 Jan. 1983).
A crossed vacuum-UV photon-$Fe(CO)_5$ molecular beam experiment was used to study the Fe emission and the $Fe(CO)_5$ photoionization yields induced by vacuum-UV photons in the 9-21-eV range. Fe emission from quintet spin states was observed, and the total 2000-8500-Å Fe fluorescence quantum yield was modeled over the 9-14-eV range by a restricted-degrees-of-freedom statistical dissociation model first used to explain Fe fluorescence produced by metastable rare gas collisions. Over this range, absolute cross sections for dissociation into neutrals, dissociation into fluorescing neutrals, and photoionization were determined. (16 refs.)

66080 Dynamics of photodissociation of HONO at 369 nm: motional anisotropy and internal state distribution of the OH fragment. R.Vasudev, R.N.Zare (Dept. of Chem., Stanford Univ., Stanford, CA, USA), R.N.Dixon.
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.399-402 (15 April 1983).
Anisotropic trnslational and rotational motion is observed in the ground-state hydroxyl radical generated by photolysis of trans-nitrous acid. The OH translational motion, determined from an analysis of Doppler line profiles, shows a sharply peaked velocity distribution with ≈46% of the total available energy (≈10300 cm^{-1}) appearing in OH recoil. The OH internal state distribution, determined from the laser excitation spectrum, is vibrationally and rotationally cold and the two $^2\Pi$ spin-orbit components are not in equilibrium. These results are compared with a simple impulse model for the fragmentation process. (15 refs.)

66081 Direct measurement of CF_3I multiphoton dissociation yield by iodine-laser detection of iodine atoms. I.A.Boriev, E.B.Gordon, A.A.Nadeikin, A.I.Nikitin, V.L.Talrose, A.M.Velichko (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.407-9 (15 April 1983).
The primary yield of CF_3I multiphoton dissociation under CO_2-laser irradiation has been determined by direct monitoring of iodine atoms using a pulsed iodine laser. The primary yield was found to exceed markedly an observed MPD yield obtained from measurement of the CF_3I consumption not only in CF_3I-N_2 but also in CF_3I-O_2 mixtures. (6 refs.)

66082 Vibrational relaxation and dissociation of strongly excited ozone molecules. V.M.Gordienko, M.S.Dzhidzhoev, V.Ya.Panchenko, V.K.Popov, I.M.Sizova, A.P.Sukhorukov, N.N.Ustinovskii, A.V.Chugunov (M.V. Lumonosov State Univ., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1432-7 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2204-11 (Nov. 1982). [received: May 1983]
A theoretical investigation was carried out of the process of thermalization of vibrationally excited ozone. For time intervals corresponding to $pt>\tau_{VV}$, τ_{VT} the calculated result were in satisfactory agreement with the experimental data obtained by an interferometric method. A theoretical analysis was made of the kinetics of dissociation of ozone by infrared radiation pulses subject to allowance for multistage excitation and collisional mechanisms of the filling of the upper vibrational levels of ozone. The dependence of the average number of absorbed photons on the density of the infrared radiation energy flux at different pressures of O_3 and of the buffer gas O_2 was determined by an optoacoustic method. The results obtained were used to estimate the *q* factor of ozone. (24 refs.)

66083 Infrared-microwave two-photon spectroscopy of the ν_2 band of $^{14}NH_3$. P.Shoja-Chaghervand, E.Bjarnov, R.H.Schwendeman (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.287-305 (Feb. 1983).
Transitions in the ν_2 band of $^{14}NH_3$ were recorded by means of an infrared laser microwave two-photon spectrometer. The spectrometer, which uses a minicomputer to step the microwave frequency and record the spectrum, is described. With sample cells outside the laser cavity good lineshapes are obtained, so that the accuracy of frequency measurement was limited by the resettability of the CO_2 or N_2O lasers employed, ~ 0.0002 cm^{-1}. The present data are compared to previously obtained results based on CO_2 or N_2O laser frequencies and to recently reported calculations. Rotational constants derived for the hypothetical inversion-free ground and $\nu_2=1$ states are reported. (28 refs.)

66084 Infrared-microwave two-photon spectroscopy of the ν_2 band of $^{15}NH_3$. P.Shoja-Chaghervand, R.H.Schwendeman (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.306-15 (Feb. 1983).
The frequencies of 60 transitions in the ν_2 vibration-rotation band of $^{15}NH_3$ were measured to an accuracy of ± 0.0002 cm^{-1} by the technique of infrared-microwave two-photon spectroscopy. These frequencies were combined with previous two-photon measurements, with diode laser results, with laser Stark data, and with ground-state inversion frequencies to derive rotational constants for the hypothetical inversion-free ground state and to derive effective rotational constants for the *s* and *a* components of the $\nu_2=1$ state. (17 refs.)

66085 The $\tilde{A}^1A_1$-$\tilde{X}^1A_1$ two-photon fluorescence excitation spectrum of 1,2-difluorobenzene. J.M.Hollas, B.J.Langham, H.Musa, T.Ridley (Dept. of Chem., Univ. of Reading, Reading, England).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.405-19 (Feb. 1983).
The two-photon fluorescence excitation spectrum of 1,2-difluorobenzene was obtained with a tunable dye laser calibrated using a combination of the neon optogalvanic spectrum and etalon fringes. The spectrum consists only of A_1-A_1 bands but the use of linear and circular polarization divides the bands into two types. The 0^0_0 type retains its intensity in circular polarization and, rotationally, shows little or no zero-rank contribution. The 5^1_0 (or 14^1_0) type loses much of its intensity in circular polarization and, rotationally, shows a large zero-rank contribution. These observations all accord with the trace of the two-photon transition tensor being close to zero for the 0^0_0 type and large for the 5^1_0 type, the latter type being involved in vibronic interaction which mixes the $\tilde{A}$ and $\tilde{X}$ states. There is strong evidence for Fermi resonance between the 5^1 and $6^1 10^1$ levels. Parts of the one-photon absorption spectrum have been photographed to aid sequence identification and also to look for the 5^1_0, A_1-A_1 transition. This transition is not observed: nor is there any evidence for intensity stealing by b_2 vibrations. (19 refs.)

66086 Pseudopotential calculations including core-valence correlation: alkali compounds. P.Fuentealba, L.V.Szentpaly, H.Stoll, F.X.Fraschio, H.Preuss (Inst. fur Theoretische Chem., Univ. Stuttgart, Stuttgart, Germany).
THEOCHEM (Netherlands), vol.10, p.213-19 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Semiempirical pseudopotentials including core-polarization account quantitatively for core-valence correlation and give accurate results even for relativistic molecules. The authors discuss the main spectroscopic constants for molecular ions of the type $A'A^+$ and AH^+ (A′,A: Li to Cs) and for the molecules LiH, NaK, LiF. (43 refs.)

66087 RKRV potential energy curves and dissociation energies of SiSe, CuSe, PbSe & MgCl. M.S.Bapat, T.Manisekaran, N.Sreedhara Murthy (Dept. of Phys., Univ. of Mysore, Mysore, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.958-60 (Dec. 1982). [received: April 1983]
The RKRV turning points for the ground states of SiSe, CuSe, PbSe and MgCl have been calculated, and the dissociation energies have been obtained by the curve-fitting procedure using an empirical potential function with the RKRV potential energy curves. The estimated values of dissociation energies are 5.46 ± 0.13, 2.38 ± 0.08, 3.31 ± 0.12 and 2.70 ± 0.06 for SiSe, CuSe, PbSe and MgCl respectively. (13 refs.)

66088 Potential energy curves & dissociation energy of YO molecule. N.B.Ishwar, M.P.Varma, B.L.Jha (Spectroscopy Lab., Indian School of Mines, Dhanbad, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.992-3 (Dec. 1982). [received: April 1983]
The RKRV potential energy curves of $X^2\Sigma^+$, $A^2\Pi_r$ and $B^2\Sigma^+$ electronic states of the astrophysically important gaseous YO molecule have been constructed using the method of S.V.J. Lakshman and T.V. Ramakrishna Rao (J. Phys. B (GB), vol.4, p.269, 1971). The dissociation energy of the molecule evaluated by the method of Lippincott is found to be 6.78 ± 0.006 eV. (25 refs.)

66089 Hypervirial calculations of Morse oscillator matrix elements [comment and reply]. A.Requena, R.Pena, J.Zuniga (Dept. of Phys. Chem., Univ. of Murcia, Murcia, Spain), J.N.Huffaker.
J. Chem. Phys. (USA), vol.78, no.7, p.4792-4 (1 April 1983).
In a recent paper, Huffaker and Tran (ibid., vol.76, p.3838, 1982) propose the use of the standard techniques of the factorization method to obtain formulas for matrix elements of powers of the quantity $y=1-\exp(-aq)$ for bound levels of a Morse oscillator. Expressions for diagonal and off-diagonal matrix elements of y, y^2, y^3, and y^4 were presented, and the above mentioned authors suggest that matrix elements of y^5, y^6,..., etc. can be obtained by matrix multiplication from those for y through y^4, using a truncated Morse basis. The interest of this determination was pointed out by Huffaker and Tran. Requena et al. propose an alternative method to obtain any matrix element of any power of y, in closed form. The procedure is based on the use of the hypervirial relationships, formulated by choosing appropriate operators to generate, in a very simple form, a recursion formula by means of which it is possible to obtain the matrix elements of the Morse oscillator in an efficient and quick way, from those for the first and second power of y. Huffaker responds to Requena et al.'s comment, acknowledging a typographical error and discussing the formulae for the matrix elements. (9 refs.)

66090 Intermolecular attractive forces in triplet excimers: *L*-shaped excimer of naphthalene. B.T.Lim, E.C.Lim (Dept. of Chem., Wayne State Univ. Detroit, MI, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5262-4 (15 April 1983).
The authors present the likely geometry of the naphthalene triplet excimer, which allows deductions to be made about the nature of the intermolecular forces which are responsible for the formation of triplet excimers. In order to more exactly define the conformation of the naphthalene triplet excimer, the authors have compared the emission characteristics of naphthalene, 1-methylnaphthalene, and 1,*n*-di-α-naphthylalkanes with those of the rigid symmetric model compound of the dinaphthylmethane, cis-6*b*, 12*b*-dihydroacenaphth(1,2-α)acenaphthylene^{20} (hereafter referred to as the Agosta dimer). (28 refs.)

66091 The He-O_2 anisotropic van der Waals potential from the interplay of theory and scattering experiments. M.Faubel, K.H.Kohl, J.P.Toennies (Max-Planck-Inst. fur Stromungsforschung Gottingen, Germany), F.A.Gianturco.
J. Chem. Phys. (USA), vol.78, no.9, p.5629-36 (1 May 1983).
The interaction of helium atoms with ground state O_2 molecules is examined over a wide range of internuclear distances that fully sample the extension of the shallow well region. A previous multiproperty study of its spherical part is extended to obtain the shape of its anisotropic behavior accurately by a best-fit procedure which involves very precise state-to-state measurements of rotationally inelastic cross sections and IOSA calculations of total and partial differential cross sections. The final form of the interaction is discussed and analyzed with respect to previous findings for similar systems. (22 refs.)

66092 Correlation of zero-point energy with molecular structure and molecular forces. I. Development of the approximation. T.Oi, T.Ishida (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA).
J. Phys. Chem. (USA), vol.87, no.6, p.1067-73 (17 March 1983).
An approximation formula for the zero-point energy (ZPE) has been developed on the basis of C. Lanczos' τ method (1956), in which the ZPE has been expressed in terms of the traces of positive integral powers of the FG matrix. It requires two approximation parameters, i.e. a normalization reference point in a domain of vibrational eigenvalues and a range for the purpose of expansion. These parameters have been determined for two special cases as well as for general situation at various values of a weighting function parameter. The approximation method has been tested on water, carbon dioxide, formaldehyde, and methane. The relative errors are 3% or less for the molecules examined, and the best choice of the parameters moderately depends on the frequency distribution. (25 refs.)

66093 Constant of the second $O_g{}^+$ ion-pair state of I_2. J.C.D.Brand, A.R.Hoy (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).
J. Mol. Spectrosc. (USA), vol.97, no.2, p.379-86 (Feb. 1983).
The second $O_g{}^+$ ion-pair state of I_2 is characterized using two-stage polarization-labeling spectroscopy. Molecular constants for this state in the range $0 \leq \nu \leq 25$, based on a global least-squares fit of 450 transitions are (in cm^{-1}) $T_e=47025.917$, $\omega_e=104.1804$, $\omega_e x_e=0.21324$, $\omega_e y_e=2.46 \times 10^{-4}$, $B_e=2.08042 \times 10^{-2}$, $\alpha_e=5.728 \times 10^{-5}$, $\gamma_e=5.8 \times 10^{-8}$, and $D_e=3.32 \times 10^{-9}$. The diabatic potential curve correlates with the states $I^-(^1S)+I^+(^3P_0)$ of the separated ions. (16 refs.)

66094 Atomic collisions in the presence of strong radiation fields: an introductory survey. G.P.Arrighini (Istituto di Chimica Fisica, Univ. di Pisa, Pisa, Italy), C.Guidotti.
THEOCHEM (Netherlands), vol.10, p.49-74 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The action of a strong radiation field from a laser source is expected to influence collision processes, frequently to a substantial degree, through the enhancement of channels already accessible and/or the opening of new ones. An introductory excursion in this area is offered, which emphasizes the role of 'dressed' electron-field potential energy surfaces and transitions between them as a key for understanding the occurrence of processes in the domain of a laser assisted chemistry. (68 refs.)

66095 The propensity rules re-examined: evidence for a long-lived complex in alkali diatomic-rare-gas collisions. M.S.Mehde, F.J.M.Al-Imarah, A.J.McCaffery (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.595-8 (22 April 1983).
When $\Delta J=\pm 1$ collision-induced transitions in Π states of excited alkali diatomics are examined over a wide range of pressures several curious phenomena are observed. With the heavier rare gases the authors find that the ± propensities reverse as pressure increases, and the circular polarisation of the parent line first decreases with increasing pressure and then begins to rise, the change-over occurring at roughly the same pressure as the reversal $\Delta J=\pm$ collision propensities. A recently proposed theoretical model involving the formation of a long-lived atom-diatomic collision complex or Feschbach resonance is involved to explain these unusual experimental results. (17 refs.)

66096 Comment on 'recent determinations of potassium ion-rare gas potentials'. F.E.Budenholzer, E.A.Giasalson, A.D.Jorgensen (Dept. of Chem., Univ. of Illinois, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5279-80 (15 April 1983).
In 1977 the present authors reported intermolecular potentials $V(R)$ for the five K^+-rare gas systems determined from molecular beam total cross section measurements. Recently, two other groups have published potentials for these systems. The first study, by Waldam and Gordon (1979) involved theoretical calculations using an electron gas model. The second determination by McDaniel and utilized a direct inversion of ion mobility data, and results were obtained for K^+ with Ar, Kr, and Xe. In some instances, there is considerable disagreement between the electron gas and the mobility results, and it is of interest to compare them with the present authors results obtained by a different method. (10 refs.)

66097 Time-independent energy-sudden transformation. Shi-Liang Ding, R.E.Wyatt (Dept. of Chem., Univ. of Texas, Austin, TX, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5627-42 (1 May 1983).
The time-independent energy sudden (ES) representation is defined through application of the energy shift operator $S=\exp[-(h-\omega_n)\partial/\partial\epsilon]$, where h is the internal (molecular) Hamiltonian. The introduction of S follows from an earlier study by Chang, Eno, and Rabitz (1980) where $\exp[-iht]$, which 'factors out' internal motion, was used to define the time-dependent ES representation. Exact integral equations for the scattering wave function within the ES representation are derived, the leading terms being the approximate ES wave function. Corrections to the ES wave function are nonsingular and involve the generalized potential increment $V=S^{-1}VS-V$, where V is the interaction potential. Boundary conditions and transition amplitudes are discussed, as is the connection between wave functions in the ES and the original representations. (11 refs.)

66098 Termolecular ionic recombination at high ambient gas density. D.R.Bates (Harvard-Smithsonian Center for Astrophys., Harvard Univ., Cambridge, MA, USA).
J. Phys. B (GB), vol.16, no.9, p.L295-7 (14 May 1983).
The importance of diffusion relative to drift in ion-ion recombination is a decreasing function of the separation between the ions (contrary to a common supposition). Langevin's formula for the recombination coefficient is obtained very simply using a physical model which allows for both diffusion and drift. (10 refs.)

66099 Ion-atom collision-induced absorption. D.Rogovin (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA), P.Avizonis, J.Filcoff.
Opt. Lett. (USA), vol.8, no.5, p.268-70 (May 1983).
The authors examine the linear electrodynamics arising from ion-atom collision-induced absorption. For this situation, induced absorption is achieved by means of long-range electrostatic forces, and the resulting spectral lines are relatively intense, symmetrical, and narrow. As a specific application, the authors examine the $^3P_0\rightarrow{}^1S_0$ forbidden transition of Sn, which is induced to absorb by collision with I^-. The resultant lines are of the order of 15 cm^{-1} wide, and the collision-induced absorption coefficient is 0.45%/cm per Torr of Sn and per 0.1 Torr of I^-. (11 refs.)

34.50E Rotational and vibrational energy transfer

66100 Vibrational kinetics of CO_2 during intense excitation of Fermi resonance modes. A.A.Likal'ter (High Temperature Inst., Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.506-11 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.614-20 (July-Aug. 1982). [received: April 1983]
A conservation equation is derived for Fermi resonance mode quanta which allows for the the flux of excitations from a region of quasiequilibrium to a region characterized by a Boltzmann molecular vibrational quantum number distribution. At high vibrational Fermi resonance model temperatures, this excitation flux is decisive in establishing quantum balance. (11 refs.)

66101 Convergence and memory effects in stochastic treatment of collisional energy transfer. A.J.Makowski, C.S.Lin (Dept. of Chem., Univ. of Windsor, Windsor, Ontario, Canada).
J. Chem. Phys. (USA), vol.78, no.7, p.4728-33 (1 April 1983).
Second and fourth order Markovian (M) and non-Markovian (NM) equations were solved analytically for stochastic treatment of collinear collision between two identical diatomic molecules. It is shown that when $\nu/2\omega L\ll 1$ is satisfied the Markovian approximation (omission of memory) is sufficiently valid and all four approximation methods (2M, 4M, 2NM, 4NM) show good agreement with exact semiclassical theory. Convergence of the transition probabilities vs. perturbation expansion of potential is slow and nonmonotonic. However, case by case, non-Markovian approximation gives a faster convergence than the Markovian. (19 refs.)

66102 Pulsed molecular beam study of state-to-state vibrational excitation in $He+I_2$ collisions: energy dependence of the $v=0\rightarrow 1$ cross section. G.Hall, K.Liu, M.J.McAuliffe, C.F.Giese, W.R.Gentry (Chem. Dynamics Lab., Univ. of Minnesota, Minneapolis, MN, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5250-1 (15 April 1983).
Reports measurements of the energy dependence of the state-to-state total cross section for vibrational excitation in a neutral-neutral system, $He+I_2$. These results represent the first published data from a new crossed, pulsed molecular beam apparatus designed for both total and differential cross section measurements. The inelasticially scattered I_2 was detected by laser-induced fluorescence (LIF). (6 refs.)

66103 Temperature dependence of intermolecular vibrational energy transfer in the two-channel cyclopropane-1,1-d_2 system. Neon bath gas. V.V.Krongauz, B.S.Rabinovitch, E.Linkaityte-Weiss (Dept. of Chem., Univ. of Washington, Seattle, WA, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5643-5 (1 May 1983).
The competitive, two-channel cyclopropane-1,1-d_2 isomerization to propylene has been used for the study of the temperature dependence of vibrational energy transfer efficiency. This note reports work with Ne bath gas at 823 and 1050K. The fall-off region was $k/k_\infty\approx 0.01$. The average amount of energy $<\Delta E>$ transferred per collision with Ne from activated cyclopropane-1,1-d_2 molecules declines with temperature rise, from 575 cm^{-1} at 823K to 275 cm^{-1} at 1050K. The relative efficiency of collisions β_w declines from 0.062 at 823K to 0.012 at 1050K. (12 refs.)

66104 Reactions of chemically produced $O_2(^1\Delta)$ with Pb atoms. J.Bachar, S.Rosenwaks (Dept. of Phys., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.526-31 (22 April 1983).
The potential of the chemical $O_2(^1\Delta)$ generator as a means of electronic excitation of metal atoms and oxides is demonstrated in a study of the reactions of $O_2(^1\Delta)$ with Pb. The resonant energy transfer process, $Pb(^3P_0)+O_2(^1\Delta)\rightarrow Pb(^3P_1)+O_2(^3\Sigma)$, is found to be the key for producing excited Pb and PbO. (24 refs.)

66105 Radiative electron capture (REC) as an indicator of the K-vacancy state of highly ionized projectiles in solids: application to stopping power. S.M.Shafroth (Univ. of North Carolina, Chapel Hill, NC, USA), K.Shima, T.Ishihara, T.Mikumo, T.Miyoshi, T.Mamoi, M.Moriyama, H.Ohara, Y.Tagishi, H.Yamaguchi, M.Yamanouchi.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1055-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Radiative electron capture (REC) has been studied at the Tandem Accelerator Center, Tsukuba University. The NEC 12 UD tandem and sputter ion source provided beams of Cl^{q+} ranging from 17+, 16+, 10+, 8+ and 7+ at energies of 120,95 and 80-MeV which were incident on C targets of varying thickness. The object of this work was to extend to higher energies and charge states the REC target thickness studies which had been done at TUNL. The data on REC cross sections, centroid energies and widths vs. target thickness are given and discussed qualitatively. The relevance of such studies to target thickness dependence of stopping power is demonstrated. (10 refs.)

66106 Charge state distributions of 1 to 7 MeV C and Be ions stripped in thin foils. M.Ch. Stoller, R.Suter, G.Himmel, G.Bonani, M.Nessi, W.Wolfli (Lab. fur Kernphys., NETH, Zurich, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1074-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The authors determine the charge state distrubtions of Be and C ions passing through thin C-foils at energies between 1.5 and 7 MeV. Both C and Be are of interest in todays efforts of using accelerators as mass spectrometers for rare radioisotopes (^{14}C and ^{10}Be in this case). The measurements have shown that the charge state distributions measured with carbon ions are independent of the ion mass at equal velocity. The measured fractions agree reasonably well with the model of Marion (1968). The Be results clearly show the disadvantage of using molecular ions in the accelerator. Unfortunately with present sputter ion sources yields of Be^- beams are very low, whereas the use of BeH^- ions, for which the effect of the Coulomb explosion is small, is hampered by technical problems of producing samples and of obtaining reliable beams. (8 refs.)

66107 Unified theory of ion-impact and shake-off contributions to multiple vacancy production. R.L.Becker (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), A.L.Ford, J.F.Reading.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1076-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
In collisions of atoms with a photon, electron, or proton the projectile usually makes at most a single hole; additional vacancies may be weakly produced by 'shake-off' resulting from a sudden change in the Hartree-Fock potential. With projectiles of nuclear charge greater than one the probability for impact ionization of both K shell electrons is increased. For K_α hypersatellites (K^2L^v) the change in the potential is much greater than for the satellites (KL^v), and L-shell shake-off may be expected to be appreciable in light atoms. The authors have extended their independent-Fermi-particle treatment of ion-impact multiple vacancy production to include shake-off. Calculations for He and C ions on neon exhibit large shake-off contributions for K^2L^v and non-negligible ones for KL^v. (5 refs.)

66108 Exploring the Born series with ion-atom collisions. J.F.Reading, A.L.Ford, S.Smith (Dept. of Phys., Texas A&M Univ., College Station, TX, USA), R.L.Becker.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1079-82 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The work of Brandt and his co-workers (1966, 1973, 1974, 1978) focused attention on corrections to the first Born approximation needed to reproduce experimentally measured low energy ionization cross sections. By varying the charge of the target nucleus Z_N and the charge of the projectile, Z_p, Brandt explored the Born series and introduced the concepts of increased binding, polarization, and Coulomb deflection. Another scheme for correcting the Born approximation is due to Glauber. This method has been applied to electron and proton scattering by Franco and his collaborators (1971). The theoretical basis for both these pictures is reviewed in the light of accurate numerical calculations of excitation and ionization. (8 refs.)

66109 Target recoil effects for inner-shell ionization in ion-atom collisions. A.L.Ford, J.F.Reading (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1083-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Calculations are reported that show the effect of target recoil on K-shell ionization in ion-atom collisions. Target recoil effects are significant in low-energy and small impact parameter collisions, for which Coulomb deflection and corrections to the first Born approximation (increased binding) are also quite important. The non-inertial recoil term that arises when the hamiltonian is written in target-centered coordinates has been discussed in the literature already by several authors. The authors' contribution is to include this finite target mass effect in their large basis coupled-state calculations, which then incorporate effects of recoil, Coulomb deflection, and target orbital perturbations and couplings in a consistent and accurate manner. Results for ionization probability as a function of impact parameter are presented and compared to experiment for several collision energies, projectiles (of different mass and charge), and targets. (16 refs.)

66110 Using nuclear resonance excitation to observe united atoms in symmetric ion-atom collisions. J.Feagin (Behlen Lab., Univ. of Nebraska, Lincoln, NE, USA), L.Kocbach.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1086-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The authors consider nuclear resonance excitation as a means to observe the distribution of united-atom orbitals in symmetric ion-atom collisions. They develop this possibility with the application of a two-state adiabatic model to an analysis of a ^8Be nuclear resonance experiment. To test their model, and to provide a more direct determination of the nuclear resonance width, they propose that the ^8Be experiment be repeated with metastable helium targets. (12 refs.)

66111 Lifetimes and fluorescence yields of states produced in heavy ion-atom collisions. C.P.Bhalla (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1093-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Recent theoretical results for few-electron metastable states are presented along with the experimental data. Average fluorescence yields are given for different atomic numbers. (6 refs.)

66112 Observation of $N_2{}^+$ 3914 Å-band emission in collisions of singly- and doubly-charged Ar, Kr and Xe ions with N_2 at keV energies. A.Matsumoto, T.Sano, T.Iwai (Dept. of Liberal Arts, Kansai Medical Univ., Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1173-7 (April 1983).
The $N^+{}_2$ first-negative-band emission ($B^2\Sigma_u{}^+ \rightarrow X^2\Sigma^+{}_g$; $\Delta v=0$) has been observed in collisions of Ar^{q+}, Kr^{q+} and Xe^{q+} ($q=1$ and 2) with N_2 molecules at the collision energies of 2-8 keV. The relative emission cross-sections for the projectile ions are discussed in connection with the exothermicity of the one-electron capture process, $A^{q+}+N_2 \rightarrow A^{(q-1)+}+N_2{}^+(B^2\Sigma^+{}_u)$. (18 refs.)

66113 Ionisation of fast Rydberg ions in collision with target atoms. D.Roschenthaler, H.D.Betz, J.Rothermel (Sektion Phys., Univ. Munchen, Garching, Germany), D.H.Jakubassa-Amundsen.
J. Phys. B (GB), vol.16, no.8, p.L233-7 (28 April 1983).
Rydberg ions with orbital dimensions up to approximately 1000 a_0 are found to traverse thin gas targets fairly undisturbed, indicating relatively small ionisation cross sections σ_i. Theoretical estimates which take into account screening of target nuclei reveal that $\sigma_i(n)$ becomes asymptotically independent of principal quantum number n. (13 refs.)

66114 Radiative decay of lithium-like ions following charge exchange collisions of 3 keV amu^{-1} C^{4+} ions with H_2. S.Bliman (DRFC/SIG, CENG, Grenoble, France), J.J.Bonnet, G.Chauvet, S.Dousson, D.Hitz, B.Jacquot, E.J.Knystautas.
J. Phys. B (GB), vol.16, no.8, p.L243-5 (28 April 1983).
The distribution of captured electrons in the 3.3 keV amu^{-1} $C^{4+}+H_2 \rightarrow C^{3+*}(n,l)+H_2{}^+$ is studied by detection of the subsequent far UV radiation. Strong lines are observed. Assuming that capture to the $n=3$ manifold dominates at this energy, a relative population of the l sublevels which decreases with the value of l is obtained. (11 refs.)

66115 Oscillatory total cross sections in the $(He\text{-}Ne)^+$ collision system: I. Optical study of $He(3^1P)$ exchange excitation (30-2000 eV).. J.P.Grouard, J.L.Montmagnon (Lab. de Phys. de Optique Corpusculaires, Univ. Pierre et Marie Curie, Paris, France).
J. Phys. B (GB), vol.16, no.8, p.1393-508 (28 April 1983).
The relative emission cross section for He 3^1P exchange excitation in He^+ Ne collisions has been measured in the low-energy range (30 eV-2 keV). When the data, including data obtained with a linear polariser, are plotted as a function of inverse impact velocity, a system of at least four different series of Rosenthal-type oscillations is observed. Their origin is discussed within the framework of the diabatic correlation diagram for the $(He\text{-}Ne)^+$ system. (21 refs.)

66116 L X-ray anisotropy and L_3-subshell alignment of heavy atoms induced by ion impact. W.Jitschin, R.Hippler, R.Shanker (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany), H.Kleinpoppen, R.Schuch, H.O.Lutz.
J. Phys. B (GB), vol.16, no.8, p.1417-31 (28 April 1983).
The anisotropy emission of the Ll X-ray line from heavy atoms ($54 \leq Z_2 \leq 92$) has been investigated experimentally for ion impact ($1 \leq Z_1 \leq 79$) in the energy range 0.15 to 10 MeV amu^{-1}. In the case of single ionisation, the collisionally induced alignment of the L_3 subshell can be derived. The data for H and He projectiles are reasonably well described by direct Coulomb ionisation theories. With increasing Z_1, the measured anisotropy becomes considerably smaller than for H impact. No pronounced dependence on the projectile nuclear charge is found although for different projectiles different ionisation mechanisms (direct ionisation, promotion of molecular orbitals) dominate. (44 refs.)

66117 Direct ionisation of the 4fσ molecular orbital in slow ion-atom collisions. U.Wille (Hahn-Meitner-Inst., KFA Berlin GmbH, Berlin, Germany).
J. Phys. B (GB), vol.16, no.9, p.L275-9 (14 May 1983).
The united-atom ionisation model of Briggs (1975) is applied to direct ionisation of the highly promoted 4fσ molecular orbital. The coherence of the amplitudes corresponding to projectile and target nucleus is fully taken into account. For cases in which a first-order treatment is inadequate, a simple non-perturbative generalisation of the Briggs model is proposed and applied. Results of numerical calculations for Ag+Ag and I+Ag collisions are discussed in the light of recent experiments. (17 refs.)

66118 K and L X-ray excitation in very-heavy-ion-atom collisions near K-L level matching. A.Warczak, D.Liesen, D.Maor, P.H.Mokler, W.A.Schonfeldt (GSI Darmstadt, Darmstadt, Germany).
J. Phys. B (GB), vol.16, no.9, p.1575-94 (14 May 1983).
Impact parameter dependences and total cross sections for K and L X-ray production have been measured near K-L level matching conditions at 1.4 MeV/N projectile energy. Comparing different collision systems ($Z_1>Z_2$ and $Z_1<Z_2$ with $Z_1+Z_2 \gtrsim 100$) the features of those processes which contribute to the excitation are discussed within existing models. (43 refs.)

66119 Excitation cross sections of the spectral lines of the doubly charged yttrium ion. A.N.Kuchenev, Yu.M.Smirnov (Moscow Power Inst., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.759-61 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.90-2 (Aug. 1982). [received: April 1983]
The transitions in a doubly charged yttrium ion (direct excitatino with double ionization) has been investigated using the method of intersecting beams with a modulated electron beam. The excitation cross sections for twelve lines of Y III for an energy of the exciting electrons of 50 eV and a monokinetic spread of the electron beam of about 1 eV have been measured. The optical excitation functions for five lines in the electron energy band from the threshold value to 250 eV has been recorded. (3 refs.)

66120 Electron energy spectrum in low-energy collisions of negative ions and atoms. Yu.F.Bydin, Yu.N.Demkov (V.I. Ul'yanov Leningrad Electrotech. Inst., A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).
Sov. Phys.-Usp. (USA), vol.25, no.7, p.453-74 (July 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.137, no.3, p.377-414 (July 1982). [received: April 1983]
The theory for electron detachment in low-energy collisions of negative ions and atoms and experimental methods for studying this detachment are reviewed. Theory and experiment are compared, particularly with regard to the energy spectra of the emitted electrons. The relationship between electron detachment and nonequilibrium processes in plasmas is discussed, as is the relationship between detachment and the occupation of highly excited states of the colliding particles. The typical parameters of the process, the possibility of extracting them from theory and experiment, and the various theoretical methods and models for detachment and ionization are all discussed. The excitation and decay of approximately stationary states (autoionization and autodetachment states) of quasimolecules and also of isolated atoms and negative ions are discussed. Isotopic effects and the corresponding theory are discussed. Information on the behavior of unstable terms of the colliding atomic particles and of the widths of these terms cannot be obtained by other methods, so that this branch of the physics of atomic collisions may be singled out for separate discussion as the 'electron spectroscopy of unstable quasimolecular states'. 34.70 CHARGE TRANSFER

(see also 82.30 Charge transfer reactions)

66121 Solvent motion controls the rate of intramolecular electron transfer in solution. E.M.Kosower, D.Huppert (Dept. of Chem., Tel-Aviv Univ., Ramat-Aviv, Tel-Aviv, Israel).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.433-5 (15 April 1983).
The fluorescence decay times (τ_F) for conversion (by intramolecular electron transfer) of the $S_{1,np}$ state into the $S_{1,ct}$ state of 6-(4-methylphenyl)amino-2-naphthalenesulfon-N,N-dimethylamide (TNSDMA) correlate well with the constant-charge dielectric relaxation times $[\tau'_1=(\epsilon_\infty/\epsilon_S)\tau_1]$ in linear alcohols. Solvent motion thus controls certain intramolecular electron transfers. (15 refs.)

66122 Model calculation of the intrinsic barrier for proton transfer in a carbon acid. H.Z.Cao, M.Allavena, O.Tapia, E.M.Evleth (Centre de Mecanique Ondulatoire Appl., Paris, France).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.458-63 (15 April 1983).
The intrinsic energy barrier for proton transfer in a model carbon acid-base system, $H_3O^+ + CH_2=CH_2$, is calculated. The role of basis sets, correlation energy, and solvation are discussed. The results are analyzed within the context of the use of the Marcus equation to characterize proton-transfer kinetics. (35 refs.)

66123 Electron capture into excited states in collisions of highly charged ions with atoms: a theoretical and experimental challenge. R.K.Janev (Inst. de Physique, Beograd, Yugoslavia).
Comments At. & Mol. Phys. (GB), vol.12, no.5-6, p.277-300 (1983).
The current status of the studies on creation of excited states by charge transfer collisions of multiply charged ions with atoms is discussed. Both theoretical and experimental problems involved in these studies are considered and suggestions are made for resolving some of them. (74 refs.)

66124 Measurement of the hyperfine interaction of free ^{75}As ions in H_2, He, Ne, Kr and Xe buffer environments and estimate of collision cross sections in the eV and meV energy region. L.Armbrecht, K.Schutter, L.Ziegeler, I.Borchert (Phys. Inst., Univ. Gottingen, Gottingen, Germany).
Hyperfine Interactions (Netherlands), vol.13, no.4, p.297-305 (Feb. 1983).
With the time-integral perturbed angular correlation (TIPAC) method the pressure dependence of the perturbation of the 121.1-279.5 keV γ-γ cascade in ^{75}As has been investigated using gaseous $H_2{}^{75}Se$ source in different buffer environments. The obtained attenuation coefficients $G_{22}(\infty)$ in the range of 0.55 to 1.0 were fitted with a theoretical stochastic model. In the region of low density, where the correlation time τ_c is large compared to the lifetime τ of the intermediate level of the nucleus, charge transfer collision cross sections have been evaluated between 8.1×10^{-16} cm^2 for He, 1.3×10^{-14} cm^2 for Xe and 1.8×10^{-14} cm^2 for the molecular H_2 buffer gas. For increasing densities of the buffer gases the correlation time τ_c became small compared to the intermediate lifetime τ. The main effect in this region is the depolarization, and the authors found cross sections between 5.2×10^{-15} cm^2 for He, 8.7×10^{-14} cm^2 for Xe and 1.2×10^{-13} cm^2 for the H_2 buffer gas. (15 refs.)

66125 Comments on the molecular complexes of aromatic amines with dinitrobenzenes. P.M.Qureshi.
J. Phys. Chem. (USA), vol.87, no.2, p.372 (20 Jan. 1983).
The author comments on some conclusions made by E.J. Thorne and R.P. Koob (see J. Phys. Chem., vol.84, p.640, 1980), with regard to the role of hydrogen bonding in charge transfer complexes. (10 refs.)

66126 Angular dependence of the probability for Ni K-shell ionisation induced by backscattered protons. Cheng-Ming Fou, M.V.Kratfel, E.C.Benck (Phys. Dept., Univ. of Delaware, Newark, DE, USA), F.Rosel, D.Trautmann.
J. Phys. B (GB), vol.16, no.8, p.1409-15 (28 April 1983).
The probability of Ni K-shell ionisation induced by 2.0, 1.0 and 0.5 MeV protons scattered into $\theta_P=90°$ and 180° has been measured. The results are in good agreement with the theoretical SCA predictions. (7 refs.)

66127 Electron capture into excited states of hydrogen. C.K.Tan, A.R.Lee (Div. of Theoretical & Space Phys., La Trobe Univ., Bundoora, Victoria, Australia).
J. Phys. B (GB), vol.16, no.8, p.1445-59 (28 April 1983).
A simple extension is made to a recent modified binary-encounter approach to calculate the cross sections of electron capture into excited states of hydrogen for protons incident on atomic hydrogen and helium. The present cross sections of electron capture into the nth principal shell of hydrogen compare satisfactorily with experimental result and appear to exhibit an n^{-3} dependence at high impact energy. The shortcomings of previous classical methods are also discussed. A method is suggested for distinguishing electron capture into the excited substrates $H(nl)$. (55 refs.)

66128 Measurements of charge transfer and $^4He^{2+}$ production in collisions between protons and $^4He^+$ ions. B.Peart, K.Rinn, K.Dolder (Dept. of Atomic Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
J. Phys. B (GB), vol.16, no.8, p.1461-9 (28 April 1983).
A coincidence technique has been developed and used to measure the cross sections for charge transfer between protons and $^4He^+$ ions at centre-of-mass energies between 14 and 67 keV. In addition, the range of the authors' previous measurements of cross sections for $^4He^{2+}$ production was extended to 67 keV. Below 14 keV the molecular state calculations of Winter et al. (1980) and Kimuran and Thorson (1981) agree closely with the measurements and, throughout the whole energy range, the recent calculations by Fritsch and Lin (1982) and Winter (1982) are on average, about 15% larger than the authors' results. The absolute accuracy of the measurements is assessed to be ±12%. (16 refs.)

66129 Molecular-state studies of charge transfer in Li^{3+}-H, Be^{4+}-H and B^{5+}-H collisions. M.Kimura (Dept. of Phys., Univ. of Missouri, Rolla, MO, USA), W.R.Thorson.
J. Phys. B (GB), vol.16, no.8, p.1471-80 (28 April 1983).
The authors have performed molecular-state close-coupling calculations of charge transfer cross sections for collisions of the fully-stripped ions Li^{3+}, Be^{4+} and B^{5+} with H(1s) atoms at low to intermediate projectile energies (1 to 15 keV amu^{-1}). Translation factor effects were included using molecular-state switching functions as in previous studies. Calculations with basis sets of different sizes were done for each system to provide a rough estimate of convergence. The results are compared with other theoretical calculations and with available experiments. (31 refs.)

66130 Inner-shell alignment of atoms in ion-atom collisions. III. Light target atoms. V.V.Sizov, N.M.Kabachnik (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Phys. B (GB), vol.16, no.9, p.1565-74 (14 May 1983).
For pt.II see ibid., vol.14, p.2635, 1981. A systematic analysis of experimental data on the alignment of the L_3 vacancy in light atoms formed in collisions with fast ions has been made. Two vacancy production mechanisms were considered: direct Coulomb ionisation and electron capture. The first Born approximation and the Oppenheimer-Brinkman-Kramers approximation, both employing realistic atomic wavefunctions, were used for the calculation of the alignment due to direct ionisation and electron capture, respectively. The results of the calculations are in good agreement with experimental data. (19 refs.)

66131 Atomic orbital expansion study of electron capture in $H^+ + Li$ and $He^{2+} + Li$ collisions. W.Fritsch (Hahn-Meitner-Inst., KFA Berlin GmbH, Berlin, Germany), C.D.Lin.
J. Phys. B (GB), vol.16, no.9, p.1595-603 (14 May 1983).
A modified two-centre atomic orbital expansion is used in an investigation of electron capture in collisions of H^+ and He^{2+} ions with Li atoms. The calculated total and partial transfer cross sections constitute the first published origin-independent results in the energy range 0.5-20 keV for $H^+ + Li$ and in the range 0.1-2.0 keV amu^{-1} for $He^{2+} + Li$ collisions. Total capture cross sections agree well with experimental data wherever the measurements have led to a consistent picture among themselves. For $He^{2+} + Li$ collisions, low-energy capture cross sections are predicted to be much larger than is indicated by results from two-state molecular orbital calculations without translational factors. (21 refs.)

66132 Low-energy scattering of charged particles. R.O.Barrachina, C.R.Garibotti (Inst. Balseiro, Bariloche, Argentina).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.17, p.583-6 (23 April 1983).
The off-energy-shell T-matrix for two charged particles is studied in the low momentum limit ($k \rightarrow 0$). The T-matrix for a Coulomb interaction (T_C) is usually considered as the limit of the amplitude for a screened potential (T_s) when the screening is removed. The authors show that this statement is not true for small enough energies. For an attractive interaction T_C and T_s differ significantly when $k \rightarrow 0$. T_C behaves as $k^{-1/2}$, while T_s keeps its k^{-1} behaviour even when the screening is turned off. They note that this is an effect which would be observed in ion-atom collisions when one electron is ejected from the atom and captured into a continuum state of the ion. (8 refs.)

66133 Laser-induced charge exchange at thermal energies. V.A.Kartazaev, V.N.Komar.
Opt. & Spectrosc. (USA), vol.53, no.3, p.344-5 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.579-81 (Sept. 1982). [received: May 1983]
The authors consider radiative charge exchange at thermal energies, $A^+ + M + \hbar\omega \rightarrow A + (M^+)^*$, as a transition between terms of a compound system consisting of an initial state ($A^+ + M + \hbar\omega$) and a final state ($A + (M^+)^*$), in the customary approach in descriptions of radiative collisions. By way of an example the authors have calculated the cross section for the Ca^+-Sr system. (11 refs.)

66134 The effect of atomic structure on potential energy crossings of the multicharged ion-hydrogen atom system. I.V.Komarov, A.I.Molotkov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.80-2 (Feb. 1983). In Russian.
The effect of inner electrons of a multicharged ion on potential energy crossings of the Zep system with large internuclear separations is considered. All crossings become pseudocrossings. In the first-order perturbation theory a formula is derived which connects splittings of pseudocrossings with ionic quantum defects and quantum numbers. The role of the ionic core in the general picture of charge transfer is discussed. (3 refs.)

66135 Measurements of the dissociative recombination coefficients of O_2^+, NO^+ and NH_4^+ in the temperature range 200-600K. E.Alge, N.G.Adams, D.Smith (Dept. of Space Res., Univ. of Birmingham, Birmingham, England).
J. Phys. B (GB), vol.16, no.8, p.1433-44 (28 April 1983).
Measurements are presented for α_t, the dissociative recombination coefficients with electrons of O_2^+, NH_4^+ and NO^+ under truly thermalised conditions within the temperature range 200-600K using a flowing afterglow/Langmuir probe apparatus, $\alpha_t(O_2^+)$ is found to vary as $\sim T^{-0.7}$ in close accord with previous pulsed afterglow data for $\alpha_t(O_2^+)$ and $\alpha_e(O_2^+)$ and with values for $\alpha_e(O_2^+)$ inferred from ion trap data. $\alpha_t(NH_4^+)$ is found to vary as $\sim T^{-.06}$. $\alpha_t(NO^+)$ is found to vary as $\sim T^{-0.9}$ which is reasonably consistent with previous pulsed afterglow data for $\alpha_t(NO^+)$. These data are also compared with values of $\alpha_3(NO^+)$ measured in a pulsed afterglow experiment and those derived from ion trap and merged beam cross section data and from atmospheric observations. (32 refs.)

34.80B Elastic scattering of electrons by atoms and molecules

66136 Non-empirical model for the imaginary part of the optical potential for electron scattering. G.Staszewska, D.W.Schwenke, D.Thirumalai, D.G.Truhlar (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA).
J. Phys. B (GB), vol.16, no.9, p.L281-7 (14 May 1983).
The authors propose a new kind of model for absorption of flux from the elastic scattering channel in electron-atom or electron-molecule collisions. It is a non-empirical model so it predicts the absorption cross section as well as the elastic scattering wavefunction and elastic differential cross sections. They have tested the model for electron scattering by He, Ne and Ar at impact energies 30-400 eV. Agreement with experiment is very good for both the absorption cross sections and elastic differential cross sections. (40 refs.)

66137 Relation between the free-free and scattering cross sections and 'two-state resonances' in bremsstrahlung. L.G.D'yachkov, G.A.Kobzev (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR).
J. Phys. B (GB), vol.16, no.9, p.1605-9 (14 May 1983).
The bremsstrahlung cross section (BCS) for electrons scattering on a short-range model potential is expressed in terms of the partial elastic scattering cross sections, $\sigma_1(E)$, for the initial (E_i) and final (E_f) electron energies without the use of the low-frequency approximation. The relation obtained allows a description of the behaviour of BCS close to the scattering resonances. Resonances in the high-frequency limit of bremsstrahlung and 'two-state resonances' (free-free transitions connecting two scattering resonances) are considered. It is shown that in the vicinity of the 'two-state resonance' BCS (considered as a function of the two variables E_i and E_f) behaves as the product of the corresponding partial resonant scattering cross sections $\sigma_{11}(E_i)\sigma_{12}(E_f)$. Resonances in the soft X-ray emission from lanthanum and cerium are discussed. (25 refs.)

66138 Six-state coupled-channel-optical calculation for e-H scattering. I.E.McCarthy, A.T.Stelbovics (Inst. for Atomic Studies, Flinders Univ. of South Australia, Bedford Park, Australia).
J. Phys. B (GB), vol.16, no.9, p.1611-17 (14 May 1983).
The coupled integral equations of the momentum representation are solved for the $n=1,2$ and 3 channels in the e-H system at 54.42 eV. The coupled potential includes polarisation potentials for exciting higher channels from the $n=1$ and 2 channels. Differential cross sections are given for all channels together with angular correlation parameters for the decay of the 2p state. Different approximations are examined for including $n=3$ channels in calculations of scattering data for $n=1$ and 2. (13 refs.)

66139 Total cross section measurements for positron and electron scattering on molecular hydrogen between 8 and 400 eV. A.Deuring, K.Floeder, D.Fromme, W.Raith, A.Schwab, G.Sinapius, P.W.Zitzewitz (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany), J.Krug.
J. Phys. B (GB), vol.16, no.9, p.1633-56 (14 May 1983).
An apparatus for the measurement of positron and electron total cross sections on gases is described. The low-energy positrons are produced by moderating high-energy positrons from β-decay sources. The authors used a ^{11}C positron source, produced at a proton accelerator and, alternatively, a ^{22}Na source, combined with various moderators. For electron measurements the secondary electrons originating from the moderator are used. The beam transport system consists of electrostatic lenses and a weak magnetic lens located in the middle of the gas cell. The discrimination against forward scattering is characterised by a cut-off angle of about 6°. The authors' e^+-H_2 and e^--H_2 data are compared with the results of recent measurements of similar accuracy performed at University College, London, and Wayne State University (Detroit), and with other e^--H_2 data. The agreement is satisfactory. (37 refs.)

66140 Curvilinearity effects in electron diffraction. II. Structure analysis of planar molecules of AB_3 type. A.G.Gershikov (Inst. for Organo-Phys. & Coal Chem., Acad. of Sci., Donetsk, Ukrainian SSR), V.P.Spiridonov, E.Z.Zasorin.
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.1-7 (May 1983).
For pt.I see ibid., vol.75, p.291 (1975). The kinetic model developed in a previous paper (1975) has been extended for the curvilinear bending motion of planar AB_3 type molecules. The curvilinearity contributions to the thermally-averaged distances were estimated and compared with those of stretch anharmonicity and perpendicular amplitude. It is found that the curvilinearity effects are significant and cannot be ignored in precise estimation of r_α (or r_e) parameters from the r_g distances measured by electron diffraction. (36 refs.)

A simple model of a Feshbach resonance ....See Entry 64627

34.80D Atomic excitation and ionization by electron impact

66141 Resonant and nonresonant electron scattering in an inhomogeneous laser field. R.Gayet, H.S.Taylor (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA).
Can. J. Phys. (Canada), vol.61, no.4, p.617-28 (April 1983).
Potential electron scattering by atoms immersed in a laser field is investigated in the case where the laser beam presents a strong transverse macroscopic inhomogeneity, due, for instance, to the need of focusing the laser beam. A reasonable model of inhomogeneity is introduced to study the important case where an isolated Feshbach resonance exists. The nonresonant scattering process with a net number N of photons absorbed or emitted is also studied. In a weak field, the inhomogeneity results in the enhancement of the $N=0$ process to the detriment of the others; in addition the probability of the $N\neq0$ process decreases when $|N|$ increases. The decline is more pronounced in a weak inhomogeneous field than in an homogeneous field whose strength is the central strength of the inhomogeneous field. In intense laser fields the situation depends on the value of the field. Similar conclusions are drawn when only the Feshbach resonance is observed. In that case it is shown that a strong inhomogeneity could be an advantage if intense enough central laser fields may be achieved. It could be of help in the search of Feshbach resonances in electron-atom collisions at energies below the first excitation threshold. (7 refs.)

66142 Excitation of the lowest-lying autoionising level in Cs I. S.N.Tiwary (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
J. Phys. B (GB), vol.16, no.8, p.L247-9 (28 April 1983).
Electron-impact integral cross sections for the excitation of the lowest-lying autoionising level generated due to the inner-shell excitation $5p^6 6s^2S^e \rightarrow 5p^5 6^{22}P^0$ transition in caesium (Cs) atomic system have been calculated within the Glauber approximation (GA) using single configuration Hartree-Fock (HF) wavefunctions for both initial and final states in the low bombarding energy region. Comparison is made with other avaialble results. (17 refs.)

66143 Measurements of complex scattering amplitudes for electron impact excitation of the 3^1D and 3^1P states of helium. H.B.van Linden van den Heuvell, E.M.van Gasteren, J.van Eck, H.G.M.Heideman (Fysisch Lab., Rijksuniv. Utrecht, Utrecht, Netherlands).
J. Phys. B (GB), vol.16, no.9, p.1619-31 (14 May 1983).
In a scattered-electron cascaded-photon coincidence experiment the authors have studied the electron impact excitation of the in=3 singlet states of helium for incident electron energies between 28 and 46 eV and for a scattering angle of 35°. This was done by measuring the angular distribution of the $3^1P \rightarrow 1^1S$ photons (the later resulting from the $3^1D(3^1S) \rightarrow 2^1P \rightarrow 1^1S$ cascade) in coincidence with the $n=3$ scattered electrons, both in the scattering plane and in the plane perpendicular to the direction of the incoming electrons. At an incident electron energy of 45.6 eV they found a small 3^1D contribution to the coincidence peak. The 3^1P results at this energy are in perfect agreement with previously reported experimental data. At an energy of 34.6 eV this is not the case. At this and lower energies they observe, apart from the dominant 3^1P contribution, a significant 3^1D contribution to the coincidence signal. The authors present new experimental data for the orientation and alignment of both excitations at 34.6, 31.5 and 28.5 eV and for the ratios of the cross sections at these energies. (13 refs.)

66144 Measurement of electron-impact excitation cross section of the germanium atom. P.A.Kolosov, Yu.M.Smirnov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.243-5 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.411-14 (Sept. 1982). [received: May 1983]
The description of an experimental arrangement and method is given for measurement of the electron-impact excitation cross section of atomic germanium. The 1900-6000-Å spectral range was investigated, in which 45 spectral lines of germanium were observed. The results of measurements for the excitation cross sections of the atomic germanium lines as well as typical excitation functions are shown. (4 refs.)

66145 Electron impact ionization of Li^+. A.Roy, K.Roy, N.C.Sil (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.63-4 (11 April 1983).
Triple differential cross sections are calculated for electron impact ionization of Li^+. The different parts of the amplitude involving three Coulomb wave functions have been reduced to one-or two-dimensional integrals in real space. (3 refs.)

66146 New directions in low energy electron molecule collision calculations. P.G.Burke (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland), C.J.Noble.
Comments At. & Mol. Phys. (GB), vol.12, no.5-6, p.301-15 (1983).
Recent trends in the ab initio calculation of low energy electron molecule collision cross sections are reviewed. New methods are being developed which it is hoped will allow accurate results to be obtained for electronic excitation cross sections as well as for rotational and vibrational excitation cross sections for complex molecules. (34 refs.)

66147 Fragmentation of μ_4-oxohexa-μ-nitratotetraberyllium, $Be_4O(NO_3)_6$, under electron impact. R.F.Galimzyanov (V.I. Vernadskii Inst. of Geochem., Acad. of Sci., Moscow, USSR).
Polyhedron (GB), vol.1, no.11-12, p.820-2 (1982).
The behviour of $Be_4O(NO_3)_6$ under electron impact is similar to that of its carboxylato analogues, $Be_4O(RCO_2)_6$ where R is H, alkyl or halogenated alkyl. In all these systems, the dissociation of the molecular ions is dominated by steric interactions. The major fragmentations involve the elimination of N_2O_5 or $(RCOO_2)$ and $Be(NO_3)_2$ or $Be(RCO_2)_2$ from the ions $[M\text{-}NO_3]^+$ or $[M\text{-}RCO_2]^+$. The results obtained confirm the structural similarity of the nitrato complex to tetra-nuclear beryllium oxocarboxylates. (8 refs.)

66148 Quantum dynamical model of laser-stimulated isotope separation of adsorbed species: role of anharmonicity, coupling strength, and energy feedback from the heated substrate. J.Lin, T.F.George (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5197-209 (15 April 1983).
A quantum model of a heterogeneous system consisting of a mixture of isotopes adsorbed on a solid surface and subjected to laser radiation is presented. The model system is described by a total Hamiltonian including direct and indirect (surface-phonon-mediated) couplings. The equations of motion are derived in the Heisenberg-Markovian picture in which the many-body effects of the surface phonon modes and the adspecies are reduced to an overall broadening(damping factor) given by the sum of the enerlgy (T_1) and phase (T_2) relaxations. The effects of the dephasing and anharmonicity on the average excitation are investigated. The 'bistability' feature with a red-shifted optimal detuning is discussed in terms of the solution of a cubic equation. A diagonalization procedure is presented in a new basis which reveals the effects of the coupling strength, the frequency difference, and the level width of the isotopes on the total steady-state excitation, which in turn reflects the surface spectrum of the model system. Finally, the isotope selectivity given by the numerical results of the time-integrated excitation is discussed. It is shown that the optimal detuning for a weak coupling strength is further red-shifted for a strong isotopic coupling strength. Finally, energy feedback effects of the bath modes on the excitations of the active modes are investigated by combining a quantum excitation equation and a classical heat diffusion equation. 66149 Fast beam radiofrequency spectroscopy. F.M.Pipkin (Lyman Lab., Harvard Univ., Cambridge, MA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1039-42 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The combination of a fast atom or ion beam derived from a small accelerator with radiofrequency spectroscopy methods provides a powerful method for measuring the fine structure of atomic and molecular systems. The fast beam makes possible measurements in which two separated oscillatory fields are used to obtain resonance lines whose widths are less than the natural line width due to the lifetimes of the states. The separated oscillatory field lines have, in addition, a number of features which make possible measurements with greater precision and less sensitivity to systematic errors. The fast beam also makes accessible multiple photon radiofrequency transitions whose line width is intrinsically narrower than that of the single photon transitions and which offer great potential for high precision measurements. This report focuses on the techniques and their promise. Recent measurements of the fine structure of H and He^+ are used as illustrations. (20 refs.)

66150 Nonlinear fast-beam laser interactions. U.Nielsen, O.Poulsen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1047-50 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
High-resolution spectroscopy performed on fast-moving absorbers has several desirable features. First, in a collinear geometry, the residual Doppler width of the fast atoms is low due to the velocity bunching taking place during acceleration. Second, the velocity of these cooled atoms can easily be changed very precisely. Third, this makes possible Doppler tuning of a laser into resonance with a particular atomic transition. Doppler shifts up to $\simeq$80 Å are present, dependent on the beam energy and the atom used. This, in turn, makes it possible to 'create' completely harmonic three-level atoms, using the relativistic transformation between laboratory and atom rest frame and to perform optical pumping in well defined spatial regions. Applications to velocity control, resonant three-level nonlinear field-atom interactions, high-resolution laser-rf double-resonance spectroscopy, and lifetime determinations are discussed. 66152 Chemical bonding in transition metal magnetic molecules and clusters. J.Keller (Facultad de Quimica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
THEOCHEM (Netherlands), vol.10, p.93-110 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The chemical bonding among transition metal atoms in molecules and clusters is strongly dependent on a balance between bonding energy and intraatomic exchange energies. Molecules and clusters may be magnetic either because of the degeneracy of the uppermost occupied levels or because there is a ground state where one or more of the atoms build a localized moment. The author shows strong evidence of the contribution of the d electrons to the bonding and then, because intraatomic exchange is so strong, of the competition between atomic magnetic moments and chemical bonding. The main examples will be Fe, Ni, Mo, Nb and Ir molecules and clusters. The cluster calculations are for groups of atoms in condensed matter boundary conditions. Multiple scattering and local density techniques are used. (19 refs.)

66153 Conformational analysis of seven-membered cyclic systems. G.Favini (Inst. of Phys. Chem., Univ. of Milan, Milan, Italy).
THEOCHEM (Netherlands), vol.10, p.139-52 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Strain energy and quantum mechanical calculations employed in an attempt to determine the geometries and the conformational energies of seven-membered rings are reviewed. Pseudorotational and interconversion modes are

described for cycloheptene, cycloheptane, oxepane, 1,3-dioxepane and their methyl derivatives. The relative energies of the possible conformations of the three isomers of 1,4-cycloheptadiene (cis-cis, cis-trans and trans-trans) and of the two isomers of 1,3-cycloheptadiene (cis,cis and cis-trans) are discussed. A particular attention is turned to the bicyclo|5.1.0|octanes and bicyclo|5.1.0.|octenes by considering the effects on conformational properties of the seven-membered ring due to the condensation of a small ring (cyclopropane or oxirane). 35.20M Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility

66154 Effect of the relative velocity on the polarizability of a collision homodiatom. L.Galatry, J.Humbert (Lab. de Phys. Moleculaire, Univ. de Besancon, Besancon, France).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.563-8 (22 April 1983).
The van der Waals induced polarizability in a homonuclear diatom is dependent on the relative velocity of the partners. This effect is introduced through Fourier expansion of the time-dependent internuclear distance, in a calculation of the energy of the pair. This calculation is carried out taking into account the nonlinear third-order polarization of the atoms in the interatomic field and in an auxiliary applied external field. The results contain, in the zero relative velocity limit, that of Hunt, Zilles and Bohr (1981). For nonzero relative velocities, a limited expansion with respect to the relative velocity is proposed. The linear term of this expansion suggests the existence of a weak optical activity for a monatomic fluid submitted to a nonuniform flow. (13 refs.)

66155 The dipole moments of some chloro- and bromopentanes. J.G.Berberian (Dept. of Chem., Saint Joseph's Univ., Philadelphia, PA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5269-70 (15 April 1983).
In the course of a study of the molecular dynamics in supercooled liquids in this laboratory, the need arose for the dipole moments of the compounds under investigation in order to correlate dielectric and steady-state shear viscosity data. The compounds investigated are 3-chloropentane (3CP), 3-chloromethylpentane (3CMP), 3-chloro-3-methylpentane (3BMP), and 3-bromo-3-methylpentane (3B3MP). Since some of these compounds have relatively high boiling points and are thermally labile, their dipole moments had to be determined in solution as opposed to vapour phase measurements. Additionally, the rationale for the use of solution dipole moments values in the study of liquids is that they show the relative dipole strengths among the compounds. Benzene was chosen as the solvent in order to maintain consistency with dipole moment data on other compounds. (10 refs.)

66156 A polynomial fitting procedure for the determination of the moments of NMR lines in polymers from the truncated FID. B.Meurer, P.Spegt, G.Weill (Univ. L Pasteur, Strasbourg, France).
J. Phys. E (GB), vol.16, no.5, p.403-7 (May 1983).
A polynomial fitting procedure (POLFIT) has been developed for the direct calculation of second and higher moments of NMR lines from the FID free induction decay in the time domain. Care must be exercised in taking the proper origin at the middle of the pulse and in choosing the degree of the polynomial given the region of the FID submitted to the fitting procedure. It requires a preliminary optimisation, starting from a theoretical curve with a shape similar to the FID under study. Conditions of stability are found which hold for all dipolar solids, particularly polymers. Extension to the polynomial fitting of a quadrupolar half echo requires a new evaluation of the stability parameters for the strongly oscillating signal. (18 refs.)

35.20P Rotation, vibration, and vibration-rotation constants

66157 Molecular constants and thermodynamic properties of some planar XY_3-type molecules. A.Dhanalakshmi, P.Kamala, M.Lalitha (Dept. of Phys., Seethalakshimi Ramaswami Coll., Tamil Nadu, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.830-1 (Oct. 1982). [received: April 1983]
The *L-F* approximation method developed by Pandey et al. [Indian J Pure & Appl. Phys., 14 (1976) 815] has been applied to study the force field of three molecules of the planar XY_3-type and the general valence force constants have been evaluated using the latest assignment of Raman and IR frequencies. The mean amplitudes of vibration and the shrinkage effect of the Y...Y bonds have been evaluated. Coriolis coupling constants have been obtained by the method of Meal and Polo. Using the Coriolis coupling constants and the vibrational frequencies, inertia defect has been evaluated by Morino method. The thermodynamic properties of these molecules have also been calculated. (15 refs.)

66158 3-methyl-3-butenenitrile and 3-bromo-2-methyl-1-propene: normal coordinate calculations based on valence force fields. S.H.Schei (Dept. of Chem., Univ. of Trondheim, Trondheim, Norway).
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.327-30 (1983).
Normal coordinate calculations have been made for the actual conformers of the molecules $CH_2\text{-}C(CH_3)\text{-}CH_2X$, $X=C{\equiv}N$, Br. A valence force field of 37(34) force constants reproduced the 33(30) fundamental frequences for $X=X{\equiv}N(Br)$ to an average deviation of 14(11) CM^{-1}. For 3-brom-2-methyl-1-propene the calculation suggests a reassignment. According to this, the existing experimental data may be reinterpreted as 3-bromo-2-methyl-1-propene having 2 conformers, instead of 3 as suggested earlier. (19 refs.)

36.00 STUDIES OF SPECIAL ATOMS AND MOLECULES

36.10 EXOTIC ATOMS AND MOLECULES (CONTAINING MESONS, MUONS, AND OTHER ABNORMAL PARTICLES)

66160 Radiative corrections to positronium decay. G.S.Adkins (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Ann. Phys. (USA), vol.146, no.1, p.78-128 (March 1983).
A method for calculating radiative corrections to positronium decay is presented that is direct, and allows for a systematic extension applicable to the calculation of corrections beyond the first $[o(\alpha)]$ correction. An expression for the decay amplitude in terms of the Bethe-Salpeter wavefunction is employed. The Bethe-Salpeter wavefunction is evaluated perturbatively in a scheme having a lowest-order bound state equation that is exactly soluble. The decay amplitude is evaluated in Coulomb gauge, without the introduction of a photon mass. One-loop renormalization in Coulomb gauge is shown to be consistent. Using this method the known analytic result for the $o(\alpha)$ correction to the parapositronium decay rate is obtained. The same method is applied to orthopositronium, and the existing theoretical discrepancy in the value of the $o(\alpha)$ correction to the decay rate is resolved. This $o(\alpha)$ correction is obtained with an error which corresponds to an uncertainty in the total rate much smaller than $\alpha^2\Gamma_{LO}$ (where Γ_{LO} is the lowest-order rate). Also, the $o(\alpha)$ correction to the differential decay rate is computed for the first time. (46 refs.)

66161 Positron annihilation in the positronium negative ion. Y.K.Ho (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA).
J. Phys. B (GB), vol.16, no.8, p.1503-9 (28 April 1983).
A theoretical study of positronium negative ions is carried out. Hylleraas-type wavefunctions are employed to describe the system and an improved ground-state energy is reported. In addition, the two-photon annihilation rate and the lifetime against two-photon annihilation are also calculated, as well as the two-photon angular correlation function. (20 refs.)

66162 Two-photon transitions in positronium. A.Quattropani (Inst. de Phys. Theorique, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland), F.Bassani.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1258-60 (25 April 1983).
The transition-probability amplitudes for absorption of two photons in positronium are computed from the 1^3S_1 ground state to the excited states 2^3S_1 and 3^3S_1 as functions of the frequencies of the photons. Sharp resonances are found in correspondence to the intermediate states and transparencies occur between each two resonances and also before the first resonance in the 1^3S_1-3^3S_1 transition. The detailed structure of the transition probability in proximity of the intermediate ^3P states reproduces the excited-state structure of positronium with inclusion of relativistic and radiative corrections. (9 refs.)

66163 On the lifetime of ortho-positronium (O-Ps) in molecular substances. Zhang Man-wei, Zhang Zhi-cheng (Univ. of Sci. & Technol., Hefei, China).
Radiat. Phys. & Chem. (GB), vol.21, no.4, p.367-73 (1983).
Both the lifetime and the intensity of O-Ps are two useful parameters of molecular substances. In this paper only O-Ps lifetime is discussed. It is considered that the O-Ps lifetime in condensed molecular substances depends predominantly on volume-factors and dielectric properties of materials. However, the chemical and paramagnetic quenching of O-Ps by molecules and active radicals in the spur cannot be neglected, and sometimes affect the O-Ps lifetime considerably. A semi-empirical formula for estimation of O-Ps lifetime is obtained. By comparison between the calculated and experimental values of O-Ps lifetime (τ_3), some predictions about chemical properties and positron radiation affects on materials are gained. (21 refs.)

66164 Positronium ion in the modified adiabatic approximation. A.V.Filinskii.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.82-4 (Feb. 1983). In Russian.
Application of the adiabatic approximation to the positronium ion does not provide a bound state. A modified adiabatic approximation taking into account nonadiabatic effects was proposed by T.K. Rebane (1974). By this approach one can obtain the positive value of the binding energy quite easily. (8 refs.)

36.20 MACROMOLECULES AND POLYMER MOLECULES

(for biological macromolecules, see also 87.15; for polymer reactions and polymerization, see 82.35)

66165 Molecular electrostatic potential versus field. Significance for DNA and its constituents.. A.Pullman, B.Pullman, R.Lavery (Inst. de Biologie Phys. Chimique, Lab. de Biochimie Theorique, Paris, France).
THEOCHEM (Netherlands), vol.10, p.85-91 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The studies of the electrostatic properties of molecules and in particular of biomolecules and biopolymers have, until recently, been limited essentially to the exploration of their molecular electrostatic potential (MEP). The authors have extended these studies to the evaluation of the molecular electrostatic field (MEF). It is shown that the different dependence upon distance of these two related properties produces substantial differences in their spatial distribution, particularly prominent in the case of macromolecules, such as the nucleic acids. Thus, while the deepest potentials are found in the grooves of DNA, the highest fields are associated with its phosphate groups. This situation has important consequences for the exploration of the biochemical reactivity of these substances, MEP being particularly appropriate for the study of the interaction with ionic, electrophilic reactants and MEF for the study of the interaction with neutral dipolar species, prominent among which is water. (18 refs.)

66166 Anisotropic rotational diffusion of an α helix and analysis of the internal motion of side chains. H.Hanssum, H.Ruterjans (Inst. fur Biophys. Chem., Univ. Frankfurt, Frankfurt, Germany).
J. Chem. Phys. (USA), vol.78, no.7, p.4687-97 (1 April 1983).
In order to investigate the anisotropic rotational diffusion of the backbone and the side chains of poly-*L*-lysine the ^{13}C spin-lattice and spin-spin relaxation times of all carbon atoms with directly bound H atoms have been obtained at a Larmor frequency of 67.89 MHz. The polypeptide was dissolved in a mixed solvent of 40% methanol and 60% water. In this solvent, at *p*H=11.3, the backbone of poly-*L*-lysine is in the conformation of an α helix with partially charged side chains. The macromolecule was, therefore, regarded as a rigid rod and the rotational diffusion of the backbone was described by two diffusion constants D_1 and D_3 which characterize the rotational diffusion of, and around, the symmetry axis, respectively. The rotational motion of the C^{β} methylene group with respect to the laboratory coordinate system is characterized by the rotational diffusion of the backbone relative to the laboratory system and by superposed rotations around the C^{α}-C^{α} bond relative to the molecular coordinate system. Simulation of the possible internal motions by using a molecular model has shown that only two rotameric positions of the β methylene group are allowed. Consequently, the model of jumps between two allowed rotamers was applied in the evaluation procedure. The corresponding theory of spin-relaxation was evaluated using Wigner rotation matrices. The diffusion constants of $D_1=1.0\times10^5$ s^{-1}, $D_3=3.8\times10^7$ s^{-1}, and the jump rate of $k_1=5.0\times10^7$ s^{-1} were evaluated. The rotations of the $C^{\gamma}H_2$, $C^{\delta}H_2$, and $C^{\epsilon}H_2$ methylene groups have been described with the model of one-dimensional diffusion around the corresponding bonds. (58 refs.)

66167 The influence of protein dynamics on Mossbauer spectra. E.W.Knapp, S.F.Fischer, F.Parak (Dept. of Phys., Tech. Univ. Munchen, Garching, Germany).
J. Chem. Phys. (USA), vol.78, no.7, p.4701-11 (1 April 1983).
Protein dynamics gives rise to characteristic changes in a Mossbauer spectrum. The spectra are analyzed by a minimum of three Brownian oscillator modes accounting for protein specific motion probed by the Mossbauer nucleus. Two of these modes are extremely overdamped; a third mode has a diffusionlike character. The drastic changes of the Mossbauer spectrum with temperature are simulated by an extended version of the Brownian oscillator. With this oscillator the protein is characterized by conformational substates and transition states. The first are responsible for the solidlike, the latter for the liquidlike behavior of the protein. The interplay of transition states and conformational substates is responsible for largely different temperature dependences of the mean square displacements from X-ray and Mossbauer experiments. (42 refs.)

66168 On the ring-to-chain ratios of radii of gyration and sedimentation coefficients of polymers of the freely jointed model: Monte Carlo calculations and the ε method. Y.Chen (Nat. Inst. of Arthritis, Diabetes & Digestive & Kidney Diseases, Nat. Inst. of Health, Bethesda, MD, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5191-6 (15 April 1983).
The configurations of rigid polymers of the freely jointed model (with excluded-volume effect) are generated on a computer using an efficient ring-generation method recently developed by the author (1981). The ring-to-chain ratios of radii of gyration and sedimentation coefficients are calculated using the generated configurations of chains and rings for a number of polymer sizes. The limiting ratios at infinite molecular weight are obtained by extrapolation and compared with those obtained by the ε method of Bloomfield and Zimm (1966), Sharp and Bloomfield (1968) and Yu and Fujita

(Yamakawa, 1971). It is found that all three treatments do not agree with the Monte Carlo results. (22 refs.)

66169 Brownian dynamics simulation of systems with transitions, particularly conformational transitions in chain molecules. E.Helfand (Bell Labs., Murray Hill, NJ, USA).
Physica A (Netherlands), vol.118A, no.1-3, p.123-35 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
Computer simulations are an effective means of probing complex nonlinear phenomena and in particular transitions. Most real systems cannot be simulated in their entirety because of limitations on computer time and storage. One useful simplification is to replace some degrees of freedom by mean field, frictional, and stochastic terms acting on the remaining degrees of freedom. Numerical techniques for solving the resulting stochastic differential equations of motion have been advanced recently. A problem with simulations is to analyze the wealth of data generated. For the study of transitions, hazard analysis has proved to be effective. An example of the above program, which led to new insights, is the study of conformational transition mechanisms in chain molecules. A crank-like counterrotation of parallel, second-neighbor bonds has been shown to be an important feature of such transition processes. (9 refs.)

36.40 ATOMIC AND MOLECULAR CLUSTERS

66170 Magic numbers for argon and nitrogen cluster ions. L.Friedman, R.J.Beuhler (Dept. of Chem., Brookhaven Nat. Lab., Upton, NY, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4669-75 (1 April 1983).
Evidence for the existence of magic numbers for cluster ions of argon atoms and nitrogen molecules has been found with high molecular weight mass spectra of their cluster ions. The observed numbers of 145, 303, 550, and 912 in mass spectra of cluster ions coincides within experimental error limit with the number of particles required for complete shell icosahedra. Failure to observe similar magic number structures in mass spectra of polyatomic molecule cluster ions and differences between polyatomic molecule cluster ion mass spectra and the argon and nitrogen cluster ion spectra are discussed. (13 refs.)

66171 Noncrystalline structure of argon clusters. I. Polyicosahedral structure of Ar_N clusters, $20<N<50$. J.Farges, M.F.de Feraudy, B.Raoult, G.Torchet (Lab. de Phys. des Solides, Univ. de Paris Sud, Orsay, France).
J. Chem. Phys. (USA), vol.78, no.8, p.5067-80 (15 April 1983).
Small argon clusters are produced in a free jet expansion and studied by electron diffraction. Due to their very low proportion in the beam sample in comparison to the monomers, the smallest detectable clusters contain about 20 atoms. When they grow up to some 50 atoms, they present the same noncrystalline structure. This structure is identical to that of solid models constructed during a molecular dynamics calculation by cooling a liquid drop of atoms interacting through a Lennard-Jones potential. Because it is composed of icosahedra of 13 atoms, either joined one to the other either interpenetrating each other, this structure may be called polyicosahedral. The comparison between theoretical and experimental diffraction functions leads to an estimate of the cluster temperature 27±3K and of the proportion of monomers in the beam. The authors discuss the similarity in the radial distribution functions of both PIC models and bulk amorphous materials, and give arguments for the stability of the clusters. (18 refs.)

66172 Electronic structure of H_n^+ and HeH_n^+ clusters. S.Raynor, D.R.Hereschbach (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.289-93 (20 Jan. 1983).
The 'solvation' of a H_3^+ molecule-ion by H_2 molecule(s) and/or a He atom was examined in ab initio electronic structure calculations. Binding energies and geometrical parameters were determined for the ground electronic states of H_n^+ (n=3,5,7,9,11) and HeH_n^+ (n=3,5,7,9) cluster ions. Floating spherical Slater orbitals (FSSO) were employed with full single and double configuration interaction (CI). All of the clusters studied were found to be weakly bound (with respect to removal of 'solvent' species). Inclusion of configuration interaction had a mjaor effect; for $n\geq5$, it increased the energy required to remove an H_2 molecule from H_n^+ by ~35% and that to remove the He atom from HeH_n^+ by ~300-400%. (20 refs.)

40.00 CLASSICAL AREAS OF PHENOMENOLOGY

(inc. applications)

41.00 ELECTRICITY AND MAGNETISM; FIELDS AND CHARGED PARTICLES

(see also 03.50 Maxwell theory: general mathematical aspects)

41.10 CLASSICAL ELECTROMAGNETISM

66173 Mechanical forces acting on capacitor electrodes in the presence of dielectric. K.M.Polivanov.
Elektrichestvo (USSR), no.1, p.1-6 (Jan. 1982). In Russian.
Analysis and examples show that in the presence of polarised dielectrics two augends of ponderomotive forces can always exist (disregarding strictive forces). One is determined by interaction between free charges and the field strength depending on the position of the dielectric and its properties. The other is determined by the pressure exerted by the dielectric on the body in contact with it. The selection of Maxwell tensor representations is discussed. (7 refs.)

66174 On the admissible values of the static magnetic permeability. O.V.Dolgov, D.A.Kirzhnits, V.V.Losyakov (Phys. P.N. Lebedev Inst., Moscow, USSR).
Solid State Commun. (USA), vol.46, no.2, p.147-9 (April 1983).
A systematic analysis of causal properties (dispersion relations) and stability under electrodynamic excitations on isotropic and uniform media is carried out. From here the range of admissible values of the static magnetic permeability is determined. It is shown that the appearance of a diamagnetic spontaneous current is impossible and there is no medium with a negative magnetic permeability. (6 refs.)

41.10D Electrostatics, magnetostatics

66175 Maximum effective charge and confinement radius for the Coulomb condensate for an isolated, charged sphere or cylinder in an electrolyte. M.A.Lampert (Dept. of Electrical Engng. & Computer Sci., Princeton Univ., Princeton, NJ, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.475-8 (15 April 1983).
An absolute upper bound theorem for the Poisson-Boltzmann equation is used to calculate, for an isolated, charged sphere or cylinder in an electrolyte (i) the maximum effective charge which can be seen afar, and (ii) a radius within which the Coulomb condensate, if present, is confined. (6 refs.)

66176 Equilibrium of magnetic liquids, magnetostatic application. J.P.Brancher, O.Sero Guillaume (LEMTA, Nancy, France).
J. Mec. Theor. & Appl. (France), vol.2, no.2, p.265-83 (1983). In French.
Magnetic liquids can be shaped by externally applied, constant magnetic fields. The study of stable equilibria is carried out using a variational principle which leads to local conditions on the free boundary. The results are applied to liquid metals submitted to high frequency magnetic fields. (14 refs.)

66177 Hydrodynamic model of the static phenomena of electromagnetism. R.G.Barrera (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.267-88 (Feb. 1983).
The authors present a hydrodynamical model which correctly describes the whole phenomenology of electrostatics and magnetostatics. Their purpose is to offer a parallel explanation to the usual one based on actions 'at a distance' in order to show the importance of the ideas about the internal mechanisms which rule the physical phenomena in the development of scientific activity. (21 refs.)

66178 A method for the computation of the linearized scalar potential for the magnetostatic field problems. J.H.Bramble, J.E.Pasciak (Dept. of Math., Cornell Univ., Ithaca, NY, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.32-5, vol.5
Reformulates the linearized scalar potential problem in terms of solution operators of standard elliptic boundary value problems on bounded domains with the introduction of spherical harmonics to handle the condition at infinity. The problem is then discretized by replacing these operators with their Galerkin-finite element counterparts and taking finite subspaces of spherical harmonics. The errors and computational properties are discussed. (11 refs.)

66179 Field computation using finite element method. K.M.Shebl, S.A.Farghal, Y.Abed (Mansoura Univ., Mansoura, Egypt).
Seventeenth Universities Power Engineering Conference, Manchester, England, 30 March-1 April 1982 (Manchester, England: Univ. Manchester Inst. Sci. Technol. 1982), 6 pp.
Presents a comprehensive analysis for the electric field intensity and potential distribution in the surrounding space of the axisymmetrical needle-plane electrode, with its strongly divergent electric field. The field near the tip of the needle is investigated thoroughly in terms of needle radius, number of subdivided elements and different boundary conditions. The effect of the needle height on the electric field intensity is discussed. (4 refs.)

41.10F Steady-state electromagnetic fields; electromagnetic induction

66180 Electromagnetic fields in a conducting spheroidal cavity: new integral equations allowing a simplified numerical solution. J.A.Imbeau (Dept. des Sci. Pures, Univ. du Quebec a Chicoutimi, Chicoutimi, Quebec, Canada), B.T.Darling, P.Amiot.
Can. J. Phys. (Canada), vol.61, no.4, p.571-81 (April 1983).
New integral equations (Darling and Imbeau (1980), Imbeau and Darling (1979)) from a generalized Huygens principle allow the calculation of electro-

magnetic fields and resonance frequencies in a conducting spheroidal cavity excited by an elementary Hertz dipole in the cavity. These equations separate into surface integral equations for the fields observed inside the cavity and null surface integral equations. The latter have a regular kernel and this permits the calculation of all the fields on the surface. The ensuing simplification allows an easy calculation of the resonance frequencies with the precision of all 16 significant digits available on an IBM-370 working in double precision. (7 refs.)

66181 Calculation of magnetic eddy fields by the scalar magnetic potential. K.S.Demirchyan, V.L.Chechurin.
Elektrichestvo (USSR), no.1, p.7-14 (Jan. 1982). In Russian.
Expounds a method for calculating magnetic fields on the basis of eddy field 'reduction' to potential fields of magnetic charges. Straight conductors of various cross-sectional shapes and coils creating three-dimensional fields are modelled. Considers introduction of fictitious currents and charges to minimise the space occupied by potential field sources. The method is applicable for calculation of the field in piecewise-uniform and nonlinear media. A quasi-stationary eletromagnetic field is calculated by the scalar magnetic potential. (18 refs.)

66182 Charge distributions in rotating conductors. O.Gron, K.Voyenli (Inst. of Phys., Univ. of Oslo, Oslo, Norway).
Eur. J. Phys. (GB), vol.3, no.4, p.210-14 (1982).
The charge distribution and electromagnetic field in a rotating conductor with a net electric charge under stationary conditions are described by Maxwell's equations and the Lorentz' force equation. The equations are written both in the inertial rest frame of the rotational axis and in the rotating rest frame of the conductor. They are applied to the case of a rotating cylinder. The existence of a spatial charge distribution in a rotating conductor is demonstrated. (42 refs.)

66183 Use of a perfectly conducting sphere to excite the plasmon of a flat surface. I. Calculation of the local field with applications to surface-enhanced spectroscopy. P.K.Aravind, H.Metlu (Dept. of Chem. Univ. of California, Santa Barbara, CA, USA).
J. Phys. Chem. (USA), vol.86, no.26, p.5076-84 (23 Dec. 1982).
The authors study the electromagnetic properties of a system consisting of a perfectly conducting sphere and a dielectric half-sphere driven by a laser. They show that the local field in the space between the sphere and the plane is strongly enhanced, making the system an interesting candidate for surface-enhanced spectroscopy. The dependence of the local field on the frequency and the spatial distribution of the enhancement factor are presented. Possible applications are discussed. (20 refs.)

66184 Energy characteristics of an electromagnetic wave and an external particle in a dispersive medium. V.P.Oleinik.
Kvantovaya Elektron., Kiev (USSR), no.23, p.80-90 (1982). In Russian.
Classical Hamiltonian mechanics is employed to examine the energy characteristics of an electromagnetic field in a transparent dispersive medium. An equation for the balance of energy in the electromagnetic field and in the external particle is obtained together with an expression for the energy of the field and a formula for the Hamiltonian function of interaction of an external particle with the electromagnetic field in the medium. The surface models of the electromagnetic fields are calculated. (11 refs.)

66185 The coherent electromagnetic field in a stochastic dielectric. D.S.Bugnolo (Florida Inst. of Technol., Melbourne, FL, USA).
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.504-6
The results of the Wigner tensor formulation for the coherent component of the electromagnetic field in an isotropic, time-invariant stochastic dielectric, are compared to some previously published results obtained by the parabolic approximation. This is done by way of a first approximation for the diagonal component of the Wigner tensor, valid for the case of weak fluctuations of the medium. (5 refs.)

41.10H Electromagnetic waves: theory

66186 Radiation pressure and 360° scattering diagrams for infinite cylinders. A.Cohen (Dept. of Atmospheric Sci., Hebrew Univ. of Jerusalem, Jerusalem, Israel), A.Gross.
Opt. Lett. (USA), vol.8, no.5, p.253-5 (May 1983).
The general solution for the scattering of electromagnetic radiation by a tilted infinite dielectric cylinder is discussed. Angular scattering curves of 360° for two polarizations are presented for given values of the size parameter and the incident polarization angle. The radiation pressure on tilted cylinders for arbitrary polarization is calculated and shown not necessarily to be within the incident plane. (5 refs.)

66187 Polarization effects in the diffraction of electromagnetic waves: the role of disclinations. J.F.Nye (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.105-32 (8 May 1983).
Three-dimensional diffraction patterns of monochromatic electromagnetic waves contain moving line singularities where the magnitude of the transverse field is zero, and its direction is therefore indeterminate. They are called disclinations, by analogy with the corresponding linear features in liquid crystals. A disclination in a vector wave is a natural generalization of a dislocation in a scalar wave. Where the scalar wave approximation in optics predicts a dislocation, or interference null, the full vector theory reveals a double helix structure: a disclination line in the electric field and another in the magnetic field winding around each other with a spacing of order (wavelength/2π). A perturbing plane wave causes this composite structure itself to become coiled. When there is a 'polarization effect' in the diffraction pattern a disclination in the electric field becomes a moving helix or, more generally, a coiled coil. As it moves it sweeps out a surface on which the polarization is everywhere linear. In optical experiments this observable surface is the most significant effect of disclinations. In general, however, the disclinations constitute elements of structure of the electromagnetic field, and their arrangement thus provides an effective way of describing the three-dimensional geometry of even very complicated diffraction fields, for example of microwaves. (15 refs.)

66188 The rate of random variability in the method of total correlation analysis. G.I.Khudykov.
Radio Eng. & Electron. Phys. (USA), vol.27, no.6, p.72 (June 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.6, p.1138-43 (June 1982). [received: May 1983]
Summary form only given, as follows. The general form of the space-time correlation functions of random wave fields is considered. A relationship between the phase velocities of the waves propagating in a given medium and the velocity of the chaotic variability, which is obtained during the statistical processing of the results of the radio-physical probing of the medium by the method of total correlation analysis, is established. (no refs.)

66189 Natural waves in an azimuthally magnetized bigyrotropic medium. III. V.A.Meshcheryakov, A.E.Mudrov, G.A.Red'kin (V.A. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.628-31 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.52-6 (July 1982). [received: May 1983]
For pt.II see Sov. Phys. J. (USA), vol.22, no.9, p.969-73 (1979) or see Izu. VUZ. Fiz. (USSR), vol.22, no.9, p.54-9 (1979). An asymptotic solution has been obtained for the system of generalized wave functions of an electromagnetic field in an azimuthally bigyrotropic medium in the proximity of an irregular singular point. The characteristic values and exponents have been determined and recurrence formulas have been established for the coefficients of formal series and the solutions found are presented in terms of the partial sums of the decreasing terms of the series. The authors consider the passages to the limit of characteristic particular cases. The results are given of a comparison of the calculation of one asymptotic solution and the corresponding regular solution. Together with the regular solutions, the relations established enable model investigations to be carried out on wave processes in media and oscillatory systems with an azimuthal double gyrotropy over a wide range of their parameters. 66190 Singularities of angular spectral characteristics of the radiation of an electron moving along the arc of a circle. V.G.Bagrov, G.K.Razina, N.N.Sirota, N.I.Fedosov (Inst. of High-Current Electronics, Acad. of Sci., USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.648-51 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.72-6 (July 1982). [received: May 1983]
A detailed analysis is given of the angular distribution of low-frequency domain of the radiation spectrum of an electron moving over a circular arc. (7 refs.)

66191 Interaction of a helical nonsymmetric wave with a fast cyclotron wave in an electron beam. D.V.Gorozhanin, B.I.Ivanov, M.I.Kapchinskii.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1339-42 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2177-82 (Nov. 1982). [received: May 1983]
The interaction of nonsymmetric waves ($m=\pm 1$) in a helical resonator with fast cyclotron waves in an electron beam is studied experimentally and theoretically. A theoretical explanation is given for the observed dependence of the interaction of the magnetic field orientation in terms of the beam gyration in the magnetic field and the azimuthal anisotropy of the resonator. As the beam velocity is increased, the locations of the cyclotron resonances change in accordance with the Doppler equation; the upper resonant frequency ($\Omega=\omega+k_2 G\nu$) becomes smaller in absolute value than the lower frequency $\Omega=\omega-k_2\nu$, where Ω is the cyclotron frequency, Ω and k_z are the frequency and wave number, and ν is the beam velocity. (see also 07.80 Electron and ion microscopy, 07.77 Beam handling equipment)

66192 Thermal axially symmetric charged-particle beams in the paraxial region. A.Svoboda (Faculty of Maths. & Phys., Charles Univ., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.401-28 (1983).
An elementary solution of the Vlasov kinetic equation is found (in the paraxial approximation), the use of which enables the author to construct the distribution function of a charged-particle beam generated by an arbitrary source. This method is applied to a thermal electron beam originating from a planar cathode with a Maxwellian emission, generalized relations for the axial component of current density are given (by including the whole phase space), and it is shown that they include as special cases the well-known current density limits investigated by Pierce (1939) and Ash (1964). The pressure tensor of the thermal electron beam is expressed explicitly, by the use of which the transversal and axial effective temperatures at any point of the paraxial region are introduced. The distribution function of a given electron beam behind an aperture is found and the behaviour of the axial component of current density in this region is investigated. It is demonstrated that the author's theory is valid for beams the perveances of which fulfil the inequality $P\ll 6.6\times 10^{-5}$ A/V$^{3/2}$. (20 refs.)

66193 Beam evolution in the field of unipotential lenses. S.Marghitu, C.Oproiu (Inst. Central de Fizica, IFTAR, Bucuresti, Rumania), R.Crametiuc.
Stud. & Cercet. Fiz. (Rumania), vol.34, no.10, p.972-81 (1982). In Rumanian.
A method for computer calculation of particle trajectory in electrostatic lenses with rotational symmetry is presented. This method was applied in the analysis of several three-electrode 'einzel' lenses susceptible to be utilized in direct accelerators. Evolution of a beam of known emittance through a particular lens geometry is also presented; the computer calculation uses as initial condition a number of points on the phase contour in object space. (7 refs.)

66194 A generalized formula of the third order electrical deflection aberration coefficients and their relation with the raster pattern. Ding Shou-Qian (Dept. of Phys., Nankai Univ., China).
Acta Phys. Sin. (China), vol.32, no.2, p.145-55 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
This paper deals with the generalization of the theory of third order aberrations of an electrical deflection system under the situation as the electron beam is originally immersed in an electric field. The formulae of third order electrical deflection aberration coefficients in an arbitrary plane have been derived. It can be applied to either sequential deflection systems or superimposed deflection yokes. By means of mathematical manoeuvres, the formulae are simplified and made easy for calculation. In order to obtain high precision, the first and second order derivatives of the field $E_0(z)$ have been eliminated. (10 refs.)

66195 Spin polarized electrons. H.C.Siegmann (Lab. fur Festkorperphys., ETH, Zurich, Switzerland).
Europhys. News (Switzerland), vol.14, no.2, p.9-12 (Feb. 1983).
Discusses methods of producing and measuring a spin-polarized electron beam. (7 refs.)

66196 A contribution to the study of electron diffraction fringes at the edge of a screen using energy filtering and field emission. M.Denizart, B.Jouffrey, S.Roques, F.Sonier, J.Trinquier (Lab. d'Optique Electronique du CNRS, Toulouse, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.5, p.329-31 (7 Feb. 1983). In French.
In energy-filtered defocused images, a bright fringe has been observed on each side of the edge of a screen. (15 refs.)

66197 Mathematical modeling of the relaxation of a powerful electron beam in a strong sinusoidal magnetic field, taking radiation into account. B.V.Alekseev, V.M.Krutilina, A.S.Litvinovich, G.V.Nesterov (S. Ordzhonikidze Moscow Aviation Inst., Moscow, USSR).
High Temp. (USA), vol.20, no.4, p.501-5 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.609-13 (July-Aug. 1982). [received: April 1983]
Numerical calculations are made of the relaxation of a powerful (0.6 MW) electron beam in air, in a strong solenoidal magnetic field. A combined code is developed, including the Monte Carlo method for calculating the evolution of the beam, the method of characteristics for calculating the divergence of the radiant flux, and the Pismen-Rockford method for calculating the air temperature. The configuration and region of beam relaxation, the heat liberation, the bremsstrahlung intensity, the electron concentration in the beam, and the temperature field of the medium are obtained. (10 refs.)

66198 Magnetic field analysis for electron beam deflector using a boundary integral method. K.Kuroda (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).
Optik (Germany), vol.64, no.2, p.125-31 (May 1983).
Describes a method for analyzing 3-dimensional magnetic fields for electron deflectors. In the basic formulation, the normal component flux density on the magnetic material surfaces is given in terms of unknown values. Computations were carried out for magnetic materials combined with cosine-distributed coils that were formed in rotationally symmetrical shapes. With this particular combination, inherent 3-dimensional problems can be reduced to 1-dimensional ones. Computation was possible with only 1×10^{-2} to 1×10^{-3} errors, within 8 to 95 seconds, and by employing a memory size of 256 kBytes. This method will be particularly useful for problems of such symmetry, especially for those with open boundaries. (9 refs.)

66199 On the solution of integral equations arising in electron optical field computations. E.Kasper (Lehrstuhl fur Theoretische Elektronenphys., Univ. Tubingen, Tubingen, Germany).
Optik (Germany), vol.64, no.2, p.157-69 (May 1983).
A simple and very accurate algorithm is developed for the iterative numerical solution of one-dimensional integral equations of Fredholm's type. Such equations are often to be solved in electron optical boundary value problems. The integrand is no longer treated as a piecewise constant function but is approximated by a smooth quadratic spline function. Further a simple summation formula is developed for the integration over logarithmic singularities. With only moderate demand for memory the relative computation error is 10^{-5} or less. (17 refs.)

66200 Dispersion properties and aberration coefficients of electrostatic cylindrical mirrors. V.M.Kel'man, S.P.Karetskaya, N.Yu.Saichenko, L.F.Fedulina (Inst. of Nuclear Phys., Acad. of Sci., Alma-Ata, Kazakh SSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1318-21 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2140-5 (Nov. 1982). [received: May 1983]
The electron-optical parameters of two- and three-electrode electrostatic cylindrical mirrors are calculated for electrodes having the form of parallel plates. Conditions are determined under which the mirrors produce a sigmatic image. It is shown that the dispersion under these conditions is considerable and that the aberration in three-electrode systems may be very small, so that such systems are particularly well suited for use as energy analyzers. (13 refs.)

66201 Electrostatic charged particle analyzer with three coaxial cylindrical electrodes. III. A three-stage analyzer with general ring-ring focusing. K.A.Men'shikov ('Quantum' Sci. & Industrial Union, Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1379-83 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2245-52 (Nov. 1982). [received: May 1983]
For pt.II see ibid., vol.27, no.10, p.1268-71 (1982). The properties of a three-cylinder mirror analyzer are described for the general case when the electron-optical source and image are rings coaxial with the cylinders. It is shown that the three-cylinder mirror analyzer gives fourth-order focusing, and that if only third-order focusing is required the input angle of the principal beam trajectory may be chosen almost arbitrarily. In the second-order focusing mode, the focal length (which is determined solely by the electrode potentials) can be varied. (9 refs.)

66202 Gaussian beam ray-equivalent modeling and optical design. R.Herloski, S.Marshall, R.Antos (Joseph C. Wilson Center for Technol., Xerox Corp., Webster, NY, USA).
Appl. Opt. (USA), vol.22, no.8, p.116-74 (15 April 1983).
It is shown that the propagation and transformation of a simply astigmatic Gaussian beam by an optical system with a characteristic ABCD matrix can be modeled by relatively simple equations whose terms consist solely of the heights and slopes of two paraxial rays. These equations are derived from the ABCD law of Gaussian beam transformation. They can be used in conjunction with a conventional automatic optical design program to design and optimize Gaussian beam optical systems. Several design examples are given using the CODE-V optical design package. (15 refs.)

66203 Diffraction analysis of rotationally symmetric optical systems using computer-generated aberration polynomials. S.C.Tam, G.D.W.Lewis, S.Doric, D.Heshmaty-Manesh (Blackett Lab., Imperial Coll., London, England).
Appl. Opt. (USA), vol.22, no.8, p.1181-7 (15 April 1983).
A ray trace scheme for the automatic generation of optical aberration polynomials to arbitrary orders pioneered by T.B. Andersen is successfully applied to the diffraction analysis of rotationally symmetric optical systems on a desktop computer. The diffraction-based optical transfer functions at various field positions are computed using the relatively new Winograd Fourier transform algorithm. The coding includes aspherical and reflective surfaces. (17 refs.)

66204 Calculation of refractive indices using Buchdahl's chromatic coordinate. P.N.Robb, R.I.Mercado (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).
Appl. Opt. (USA), vol.22, no.8, p.1198-215 (15 April 1983).
In this paper the authors have completed an error analysis of the Buchdahl glass model for 813 glasses available from five manufacturers. A quadratic model has a standard deviation of 0.00002 and a maximum absolute error of 0.0001 in the visible spectral region. A cubic model has a standard deviation of 0.00005 and a maximum absolute error of 0.00026 over the full spectral region from 0.365 to 1.014 μm. A table giving the Buchdahl fitting coefficients for all the glasses, as well as the standard deviation and maximum error for each glass, is included for the quadratic model. The results indicate that the Buchdahl model is ideally suited for theoretical studies of refracting optical systems. (11 refs.)

66205 Gaussian brackets and their application to paraxial theory. II. Paraxial theory in terms of generalized Gaussian constants. K.Tanaka (Canon Res. Center, Canon Inc., Tokyo, Japan).
Optik (Germany), vol.64, no.2, p.89-111 (May 1983).
For pt.I see ibid., vol.64, pt.1, p.13 (1983). Reconstructs the formulation of paraxial theory in terms of Gaussian brackets together with some novel formulae, and presents some examples of application to analyses of optical systems. (25 refs.)

66206 Diffraction of light by a perfectly conducting biaxial periodic surface. A.Wirgin (Lab. de Mecanique Theorique, Univ. Paris VI, Paris, France).
Opt. Commun. (Netherlands), vol.45, no.4, p.221-5 (15 April 1983).
The Rayleigh theory is numerically implemented for a crossed sinusoidal grating. It is shown that the scattering pattern of such a structure can be very sensitive to the polarization of a normally-incident plane wave when the surface periodicities are of the order of the wavelength. (26 refs.)

66207 Periodic spatial coherence function resulting from acoustooptic interaction in the Bragg diffraction region. Y.Ohtsuka, Y.Imai (Dept. of Engng. Sci., Hokkaido Univ., Hokkaido, Japan).
Opt. Commun. (Netherlands), vol.45, no.4, p.226-30 (15 April 1983).
A tentative description is given of the scheme for generating a periodic coherence function that results from the acoustooptic interaction in the optical Bragg diffraction region. The resultant coherence function varies with a period of one acoustic wavelength, as well as periodically with an increase in the acoustic power level. Its modulus and phase are computed and discussed. (13 refs.)

66208 Diffraction theory of the defocused-diaphram method. T.P.Kosoburd, F.A.Markus.
Opt. & Spectrosc. (USA), vol.53, no.3, p.330-2 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.559-61 (Sept. 1982). [received: May 1983]
The authors examine the intensity distribution in the observation plane of a schlieren instrument with a periodic structure as a defocused diaphragm, taking diffraction effects at the diaphragm into account and ignoring refraction in the object. (3 refs.)

66209 Young's interference fringes with narrow-band light. E.Wolf (Schlumberger-Doll Res., Ridgefield, CT, USA).
Opt. Lett. (USA), vol.8, no.5, p.250-2 (May 1983).
The changes in the interference pattern in Young's interference experiment, produced by placing two identical narrow-band filters in front of the pinholes, are analyzed. It is shown theoretically that, in general, the fringes will not become sharp (i.e. their maximum visibility will not tend to unity) even when the filters have arbitrarily narrow passbands. The analysis brings out a rela-

tionship between the complex degree of coherence in the space-time and the space-frequency domains. When the passbands of the filters are narrow enough, the filtered light is found to be cross-spectrally pure. (6 refs.)

66210 Light scattering efficiency of dielectric spheres. C.Singh, R.N.Singh (Phys. Dept., Indian Inst. of Technol., New Delhi, India).
Opt. Appl. (Poland), vol.12, no.2, p.219-29 (1982).
A theoretical study of individual and collective contributions of electric and magnetic multipoles to light scattering efficiency of dielectric spheres is presented. (5 refs.)

66211 Diffraction of light by a bigrating: Surface polariton resonances and electric field enhancements. N.E.Glass, A.A.Maradudin (Dept. of Phys., Univ. of California, Irvine, CA, USA), V.Celli.
Phys. Rev. B (USA), vol.27, no.8, p.5150-3 (15 April 1983).
The authors present a theory of the diffraction of light of arbitrary polarization incident on a doubly periodic dielectric grating. They use Rayleigh's method together with the vectorial equivalent of Kirchoff's integral. The amplitudes of the diffracted spectral orders are calculated for a sinusoidal bigrating and for a square lattice of hemiellipsoids on a flat surface, for Ag. The enhancement of the electric field on and near the surface is calculated and is found to reach values of about 300. (16 refs.)

66212 Significance of the caustic curves in optics. O.C.Nunez, J.P.Contreras, A.Rodriguez (Inst. Nacional de Astrofisica, Optica y Electronica, Puebla, Mexico), A.C.Davila.
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.245-58 (Feb. 1983).
The concept and a simplified formulation of the so-called caustic curves are introduced. It is assumed that the caustic curve is produced by a conic wavefront coming from an optical system or component. (9 refs.)

66213 Light refraction by an excited isotropic dispersing medium. B.A.Veklenko (Moscow Energy Inst., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.746-8 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.74-8 (Aug. 1982). [received: April 1983]
It is shown that a photon incident from a vacuum on a dispersing transparent isotropic medium undergoes double refraction if part of the molecules of the medium are in an excited state. The intensities of the refracted rays are estimated. (4 refs.)

66214 Calculation of ray paths in the principal plane of a uniaxial crystal. M.G.Serbulenko.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.487-9 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.18-19 (Aug. 1982). [received: April 1983]
An algorithm for calculating the ray paths in the principal plane of a uniaxial crystal having plane nonparallel boundaries is formulated on the basis of the principle of the conservation of the tangential components of the wave normals and the methods of analytical geometry. For the most part the algorithm does not employ trigonometric functions; this speeds up the calculation on a computer and increases its accuracy. (5 refs.)

66215 Diffraction of Gaussian beam by a smooth convex object. M.I.Yavor.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.84-8 (Feb. 1983). In Russian.
The asymptotics of the field of a Gaussian beam diffracted by a smooth convex object in a two-dimensional inhomogeneous medium has been obtained. It is assumed that the central ray of the Gaussian beam passes close to the object boundary, touches it or is reflected at the angle close to $\pi/2$. (7 refs.)

42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

66216 The statistical properties of polarized laser speckle. Wang Naiquan, Zhang Hong-jun, E.Yun (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.1, p.124-32 (Jan. 1983). In Chinese. English translation in; *Chin. J. Phys. (USA)*
The statistical properties of polarized laser speckle is discussed. An exact probability density function is integrated intensity of partially polarized laser speckle is obtained. The authors study by the experiment how the probability density function of integrated intensity of polarized laser speckle varies with the area of detector aperture and mean intensity. (8 refs.)

66217 The mean square error of the multiplicative model for speckle noise. Qin Ke-Cheng (Dept. of Phys., Peking Univ., Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.267-72 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The mean square error of the multiplicative model for speckle noise in coherent imaging is derived. The author obtains the condition under which the multiplicative model is valid, that is: the model only when the details of the object can be completely resolved by the imaging system. (9 refs.)

66218 Light scattering by large spheroids in the Physical Optics Approximation: numerical comparison with other approximate and exact results. J.C.Ravey, P.Mazeron (Lab. de Biophys. Moleculaire, Univ. de Nancy I, Vandoeuvre Les Nancy, France).
J. Opt. (France), vol.14, no.1, p.29-41 (Jan.-Feb. 1983).
Physical Optics Approximation is used to compute scattering efficiency factors forward- and back-scattering intensities, angular distributions of intensity and depolarization by large dielectric or absorbing spheroids. The results are compared with those obtained by exact theories or other approximate calculations. If the radius of curvature at any point of the illuminated part of the scatterer is greater than about a few wavelengths, that approximation is generally the best one and in good agreement with the exact theories. This curvature requirement depends on the size of the spheroid but also on its orientation with respect to the incident light direction. (21 refs.)

66219 On further development of the layer decomposition method applied to wave propagation in inhomogeneous media. P.Croce (Inst. d'Optique, Centre Univ. d'Orsay, Orsay, France).
J. Opt. (France), vol.14, no.1, p.49-55 (Jan.-Feb. 1983). In French.
The basic equation yielding the radiance scattered from a plane layer, as formulated in previous papers, is determined again by using changes in the tangential components of both electric and magnetic fields. Hence it is possible to extend the layer decomposition method to wave propagation in inhomogeneous media having a rough cylindrical or spherical symmetry. For a very simple case a programme has been written to test practical potentialities of the method. (5 refs.)

66220 Non-Gaussian image plane speckle: measurements from diffusers of known statistics. B.M.Levine, J.C.Dainty (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA).
Opt. Commun. (Netherlands), vol.45, no.4, p.252-7 (15 April 1983).
The second and higher moments of intensity in non-Gaussian image plane speckle patterns have been measured for deep phase screen diffusers. The diffusers were specially fabricated to have a Gaussian distribution of phase with a standard deviation in the range 6-9 rad and a Gaussian phase autocorrelation function of width ≈ 80 μm. Measurements of the second moment are in good agreement with the theoretical predictions of Jakeman and McWhirter (see Appl. Phys., vol.B26, p.125, 1981). (22 refs.)

66221 Wave-field statistics in scattering by a system of particles. A.G.Borovoi, A.V.Ivonin.
Opt. & Spectrosc. (USA), vol.53, no.3, p.329-30 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.557-9 (Sept. 1982). [received: May 1983]
The optical field scattered by a system of some large number N of randomly positioned particles is usually assumed to be a random Gaussian field. The assertion is based on the central-limit theorem ($N \rightarrow \infty$) of probability theory for the sum of independent random quantities. The authors show that such fields are not always Gaussian, and offer some criteria for transforming them into a Gaussian field. In particular, the transition to a Gaussian field in certain cases depends on the number of particles not throughout the illuminated region but only in some part of it. The authors note that these results are in accordance with the results on the statistics of fields that are propagating in turbulent media or behind random phase screens and of the fields reflected from rough surfaces. (5 refs.)

66222 Correction of angular displacements of optical beams. O.N.Emaleev, V.P.Lukin (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1470-4 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2264-71 (Nov. 1982). [received: May 1983]
One of the simplest algorithms for adaptive correction (correction of a random tilt of a wavefront) is considered in the case of a wide optical beam when a point reference source is used. An analysis is made of various algorithms for the determination of a random tilt. A calculation is made of the distribution of the average intensity of the corrected field. The results are given of an experiment carried out over a near-ground path. The problem of correlation of random tilts of a phase front and of high-frequency phase fluctuations is discussed. (20 refs.)

66223 Depolarized light scattering from large particles. B.A.Storonkin.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.91-3 (Feb. 1983). In Russian.
Dynamic light scattering from large optically anisotropic particles in external field is investigated. The depolarized components of spectral intensities of scattered light are obtained in various values of external field. (4 refs.)

42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

66224 Application of Weigert effect to the pseudocoloration of a black and white signal. S.Debrus, M.P.Henriot, M.May (Inst. d'Optique., Univ. Pierre et Marie Curie, Paris, France).
Opt. Commun. (Netherlands), vol.45, no.4, p.241-3 (15 April 1983).
Proposes a method to transform the grey levels of a black and white transparency into different colours. The transparency to be processed, illuminated by a beam of linearly polarized white light, is twice recorded on a photographic silver-chloride emulsion. The direction of the light vector is rotated through $\pi/2$ between the exposures. The resulting plate is characterized by a spatially varying anisotropy. The main point is that the wavelength λ_B and λ_D, respectively corresponding to the cancellation of birefringence and dichroism,

are functions of the irradiance of the signal and of the successive exposure times. The plate is then illuminated in white light and observed between two polarizers P and A. It reconstructs an achromatic image of T when the respective axes of P and A are mutually perpendicular. A rotation of A from its setting crossed with P generates a colour distribution on the plate. (5 refs.)

66225 **Colour image enhancement by white light spatial filtering.** J.Santamaria, A.Plaza, J.Bescos (Inst. de Optica, Madrid, Spain).
Opt. Commun. (Netherlands), vol.45, no.4, p.244-51 (15 April 1983).
Colour enhancement of transparencies with degraded colours is obtained by attenuation of the zero order component of the white light spatial spectrum. The filtering is performed in two ways, directly and sequentially, and the efficiency of the enhancement is estimated through the measurement of the colour difference for several pairs of colours of the object. The method is described in detail and some colour results are presented. (14 refs.)

66226 **Quality of image transmission by light-scattering layers with different particle packing.** V.P.Dik, A.P.Ivanov, V.A.Loiko.
Opt. & Spectrosc. (USA), vol.53, no.3, p.301-4 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.512-16 (Sept. 1982). [received: May 1983]
Experimental study is done on the modulation-transfer function of a layer of dispersive medium for two kinds of particle packing: extremely dilute and dense. It is shown that cooperative phenomena appear for dense particle packing that leads to both deterioration and enhancement of image transmission. The bands of spatial frequencies and weighting of the dispersed substance considered here are determined at which enhancement of the contrast transfer is observed and the amount of variation of the modulation transfer coefficient is studied. As explanation is given of certain special features of image transmission by densely packed systems. (8 refs.)

66227 **Apodization of a passive coherent optical system for improving the image of the edge of a half-plane.** M.Ya.Mints, E.D.Prilepskii.
Opt. & Spectrosc. (USA), vol.53, no.3, p.311-14 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.529-34 (Sept. 1982). [received: May 1983]
Problems of apodizing a coherent passive optical system are considered to improve the image of the edge of a half-plane. The solutions obtained for the pupil function allow one to achieve an appreciable damping of intensity oscillations while retaining sufficient contrast in the image of the edge of a coherent object. (14 refs.)

66228 **Real-time edge enhancement in four-wave mixing with photorefractive BGO crystals.** Y.H.Ja (Telecom Australia Res. Labs., Clayton North, Australia).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.269-73 (May 1983).
Reports the edge enhancement using four-wave mixing (FWM) in a reflection geometry with highly sensitive photo-refractive $Bi_{12}GeO_{20}$ (BGO) crystals. (10 refs.)

66229 **Dilute uniformly redundant sequences for use in coded-aperture imaging.** W.J.Wild (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Opt. Lett. (USA), vol.8, no.5, p.247-9 (May 1983).
A class of binary sequences with ideal autocorrelation properties is given for several lengths. These sequences possess the property that their periodic autocorrelation sidelobes are a constant unity; they represent a class of codes that are both uniformly redundant and nonredundant. Application to coded-aperture imaging is discussed. (15 refs.)

66230 **Diffraction images of two dimensional elliptical objects.** A.Chandra, R.N.Singh, K.Singh (Phys. Dept., Indian Inst. of Technol., New Delhi, India).
Opt. Appl. (Poland), vol.12, no.2, p.243-52 (1982).
Presents a theoretical study of the diffraction images of elliptical objects formed by ideal systems having circular and angular apertures. The object illumination is assumed to be incoherent. Intensity distribution in the images has been evaluated by using the Fourier transformation approach. Results have been presented in the form of graphs along two directions in the image plane. (30 refs.)

66231 **The phase problem in object reconstruction and interferometry.** H.A.Ferwerda (Dept. of Appl. Phys., State Univ. of Groningen, Groningen, Netherlands).
Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.ThA1/1-4
Methods of phase retrieval from modulus data in one and two dimensions are reviewed in the context of object reconstruction and interferometry (including speckle). Interference microscopy is also considered. (13 refs.)

66232 **Phase retrieval for functions with sufficiently disconnected support.** T.R.Crimmins, J.R.Fienup (Environmental Res. Inst. of Michigan, Ann Arbor, MI, USA).
Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.ThA3/1-4
It is shown that the phase retrieval problem almost always has a solution unique among functions with disconnected supports satisfying a certain common separation condition. (5 refs.)

66233 **Omnidirectional viewing: the fish-eye lens problem.** N.Alvertos, E.L.Hall (Electrical Engng. Dept., Univ. of Tennessee, Knoxville, TN, USA), R.L.Anderson.
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.174-9
A fish-eye lens image can include information covering a 2π steradian field of view. These types of images appear with an unavoidable inherent distortion which can be corrected with image processing techniques. A method for geometric restoration of such distorted images is derived and its resolution is examined. After the final geometric restoration the image can be further improved by applying deblurring techniques. Examples of 'distorted' and 'undistorted' images are presented to clarify the results of the method described. (9 refs.)

42.40 HOLOGRAPHY

(for acoustic holography, see 43.63)

66234 **Holographic interferometer for testing aspheric molds and molded parts.** S.D.Fantone (Optical Engng. Dept., Polaroid Corp., Cambridge, MA, USA).
Appl. Opt. (USA), vol.22, no.8, p.1121, 1126 (15 April 1983).
Describes a holographic interferometer which allows the testing of plastic aspheric surfaces against a standard derived from the mold insert. (no refs.)

66235 **Holography in engineering design.** C.Wykes (Dept. of Mech. Engng., Loughborough Univ. of Technol., Loughborough, England).
Engineering (GB), vol.223, no.4, p.262-5 (April 1983).
Optical techniques, such as holography, are becoming increasingly important in engineering design and measurement. As they are non-contacting, non-instrusive and allow large-scale views of surface displacements they have several advantages over mechanical systems such as strain gauges and accelerometers. The theory and applications are presented. (no refs.)

66236 **Diffraction of a light wave by a volumetric hologram in an anisotropic medium.** V.M.Serdyuk, A.P.Khapalyuk.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.836-9 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.132-6 (July 1982). [received: March 1983]
Considers the general laws governing the diffraction of light at volumetric holograms in anisotropic media. The structure of the dielectric-permittivity tensor and the electrooptical-coefficient tensor are not given in specific form, and the results obtained are applicable to various crystals, both uniaxial and biaxial. (8 refs.)

66237 **Dynamic holograms on free carriers in semiconductors.** A.A.Borshch, M.S.Brodin, V.I.Volkov, I.L.Romanenko.
Kvantovaya Elektron., Kiev (USSR), no.23, p.22-9 (1982). In Russian.
Surveys experimental work on the recording of dynamic phase holographic gratings in a wide range of semiconductors. On the basis of an analysis of the mechanisms of recording and erasure of holograms it is shown that there are certain restrictions superimposed on the efficiency and high-speed response of holograms on non-equilibrium free carriers. The authors examine various approaches to increasing the speed and diffraction efficiency of dynamic holograms in semiconductor crystals. (28 refs.)

66238 **The diffraction efficiency of holographic gratings made out of the photosensitive system As_2Se_3-As_2S_3-Ag.** M.T.Kostyshin, K.S.Mustafin, P.F.Romanenko, V.A.Seleznev.
Kvantovaya Elektron., Kiev (USSR), no.23, p.29-33 (1982). In Russian.
The basic characteristics of the As_2Se_3-As_2S_3-Ag system and also the results of experiments to raise the diffraction efficiency of holographic gratings recorded in this material are presented. It is shown that if low output power lasers are used to record gratings it is possible to achieve a diffraction efficiency of the order of 40% for polarised light and 34% for natural light. (10 refs.)

66239 **Possibility of discrete recording of information by a holographic method in the Fresnel diffraction zone.** S.N.Mensov, Yu.N.Zakharov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.307-11 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.522-8 (Sept. 1982). [received: May 1983]
The method of holographic recording of complex objects is used as an example to treat the question of the effect of spatial discretization of wave fields in the Fresnel diffraction zone on the quality of the image reconstructed from it. Recommendations are given for obtaining undistorted images in schemes with discrete recording of Fresnel holograms. (5 refs.)

66240 **Holography, coherent light amplification and optical phase conjugation with photorefractive materials.** P.Gunter (Lab. of Solid State Phys., Swiss Federal Inst. of Technol., ETH, Zurich, Switzerland).
Phys. Rep. (Netherlands), vol.93, no.4, p.199-299 (Dec. 1982). [received: April 1983]
The paper presents a review of photorefractive effects in electrooptic materials and their applications. Materials properties giving rise to increased photosensitivities are discussed and compared with experimental data for a series of newer materials. The formation of volume holograms in these crystals, and accompanying optical effects such as beam coupling and phase conjugation are discussed. Theoretical results derived from charge transport parameters are compared with the author's original data obtained in 'dynamic holography' experiments with $Bi_{12}GeO_{20}$, $Bi_{12}SiO_{20}$ and $KNbO_3$:Fe^{2+}. The optimum parameters for applications such as volume hologram storage, coherent light amplification, optical phase conjugation, etc., have been determined, and possible applications are discussed. (174 refs.)

66241 Holographic recording on board the Salyut-6 space station. N.M.Ganzherli, S.B.Gurevich, V.V.Kovalenok, B.Konstantinov, M.Cordero, I.A.Maurer, S.Mesa, R.Oms, S.A.Pisarevskaya, V.Rivera, M.Rivero, B.F.Ryadinskii, V.P.Savinykh, Yu.P.Semenov, M.S.Cheberyak, D.F.Chernykh (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1348-51 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2192-7 (Nov. 1982). [received: May 1983]
A test object, a three-dimensional body, and a dissolving crystal were recorded using the GA-1 holographic instrument specially designed for use in space. It is found that crystals dissolve more slowly under low-gravity conditions than they do on Earth (by a factor of $\sim$20). It is shown that the details of the outer surface of a viewport in the space craft can be recorded holographically. Holography can be used in control and test experiments in space. (2 refs.)

66242 Holographic image transmission in a closed TV system. S.P.Vorob'ev.
Tekh. Kino & Telev. (USSR), no.4, p.31-3 (April 1983). In Russian.
The conditions of distortionless holographic image transmission of document pages via a TV channel are considered. It is shown that for holographic image transmission, the bandwidth of 5-20 MHz is required. (11 refs.)

66243 Preliminary optical inspection of holographic images synthesized by using phototransparencies. N.K.Ignat'ev.
Tekh. Kino & Telev. (USSR), no.4, p.33-4 (April 1983). In Russian.
Describes a method of preliminary optical inspection of *3D* holographic images synthesized by using a set of phototransparencies. Inspection is carried out by viewing a sequence of specially oriented transparencies through a sequence of the same number of lenses with specially chosen focal lengths. Major data on the optical diagram are given. (2 refs.)

42.50 QUANTUM OPTICS

66244 Semiclassical many-mode Floquet theory. T.-S.Ho, S.-I.Chu, J.V.Tietz (Dept. of Chem., Univ. of Kansas, Lawrence, KS, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.464-71 (15 April 1983).
It is shown that the single-mode Floquet formalism of Shirley (1965) can be extended to a generalized many-mode Floquet theory, yielding a practical non-perturbative technique for the semiclassical treatment of the interaction of a quantum system with several monochromatic oscillating fields. The theory is illustrated by a detailed study of the population dynamics of a three-level system drive by two monochromatic radiation fields. (17 refs.)

66245 The rotating-wave approximation in bound-free transitions. J.Javanainen (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).
J. Phys. B (GB), vol.16, no.8, p.1343-61 (28 April 1983).
The author solves the Schrodinger equation in terms of continued fractions for a system exhibiting light-induced bound-free transitions over an energy gap, without making the rotating-wave approximation. He describes the evolution of the bound state and the photoelectron spectrum by investigating the analytic properties of the Fourier transforms of the probability amplitudes. The main consequence of non-RWA transitions is a Bloch-Siegert shift of the continuum threshod, which may be comparable to RWA dynamic level shifts. At high intensities the counter-rotating wave also influences the evolution of the bound state, and gives rise to multiphoton transitions competing with RWA multiphoton transitions with an odd number of photons, but these effects are probably hard to isolate experimentally. (22 refs.)

66246 Sidebands in cooperative resonance fluorescence in collections of *N* three-level atoms in strong excitation laser fields. C.C.Sung, C.M.Bowden (Us Army Missile Lab., US Army Missile Command, Redstone Arsenal, AL, USA).
Opt. Commun. (Netherlands), vol.45, no.4, p.273-7 (15 April 1983).
It is shown that, in addition to an Autler-Townes doublet, the resonance fluorescence spectrum of *N* three-level atoms consists of sidebands separated by three pump Rabi frequencies and much reduced in intensity to the symmetrically-located central doublet. The sidebands are due to cooperative atomic interaction. (18 refs.)

66247 Superrradiance: an essay on the theory of collective spontaneous emission. M.Gross, S.Haroche (Lab. de Phys., Ecole Normale Superieure, Paris, France).
Phys. Rep. (Netherlands), vol.93, no.5, p.301-96 (Dec. 1982). [received: April 1983]
This essay presents a theoretical description of the superradiance phenomenon, in which both the quantal and the classical aspects are discussed. Starting from the simple two-level atom-small sample Dicke model the authors successively introduce various complications inherent to a realistic superradiance experiment: effects of Van der Waals interaction between the atoms, propagation and diffraction of the electromagnetc field in the sample and finally the effects related to atomic level degeneracy or near degeneracy. They recall how to calculate the field radiated by a superradiant system in a single experiment and how to determine, for a series of identically prepared superradiant samples, the large shot to shot fluctuations of the emitted light properties. The presentation tries to unify various points of view and formalisms developed in previous works and to introduce simply and progressively the basic physical concepts relevant to the superradiance phenomenon. (98 refs.)

66248 Theory of the spectrum of the quantised light field. J.D.Cresser (Max-Planck-Inst. fur Quantenoptik, Garching, Germany).
Phys. Rep. (Netherlands), vol.94, no.2, p.47-110 (Jan. 1983).
The formal classical concepts of spectrum, well-founded as part of the theory of stochastic processes, has been applied extensively to the analysis of the properties of classical light fields. In the case of quantum mechanical light fields, the concept of spectrum has not been so well defined, and approaches of considerable diversity have been used to develop various quantum definitions. A review is given of the various ways in which the quantum definitions have been formulated, and a comparison with the classical stochastic theory presented, with the emphasis on the role of the statistical ensemble in formulating the classical definitions. Arguments are presented which suggest that the formal classical approach cannot in fact be followed in the quantum regime, so that the various quantum definitions cannot in general be intepreted in the same way as in the classical case. However, by adopting an operational point of view based on the use of a two level atom as a field detector (the Scully-Lamb-Glauber model), it is possible to formulate a definition of the quantised field which admits a satisfactory physical interpretation but which also, in an operational sense, puts the quantum and classical definitions on an equal footing. This definition is analysed in detail in the quantum case, in particular in the case of the light field being coupled to its sources. (92 refs.)

42.52 MASERS

66249 Dynamics of multimode electron masers. L.G.Blyakhman, G.S.Nusinovich.
Radio Eng. & Electron. Phys. (USA), vol.27, no.5, p.137-44 (May 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.5, p.996-1004 (May 1982). [received: April 1983]
The energy and phase interactions of modes in multimode masers are investigated. If the self-excitation threshold of the oscillator is exceeded by a small amount and modes close to the natural frequencies are involved, then the primary nonlinear effect in the mode interaction is their competition, leading to the establishment of one-mode oscillations. When the beam current exceeds the starting values by a larger amount, a mode with a low starting current turns out to be in a position to maintain, because of the dispersion of the electron-beam nonlinearity, the oscillations of a higher frequency mode, whose increment may be positive or negative. As shown for the example of a gyrotron, the establishment of a mutual mode synchronization regime is possible, because of this effect, in an oscillator with three modes that are considerably separated in frequency (on the scale of the cyclotron-resonance bandwidth). (17 refs.)

42.55 LASING PROCESSES

42.55B General theory of lasing action

66250 Thermodynamics of daylight-pumped lasers. C.B.Roxlo, E.Yablonovitch (Exxon Res. & Engng. Co., Linden, NJ, USA).
Opt. Lett. (USA), vol.8, no.5, p.271-3 (May 1983).
The authors cast the problem of very-low-threshold, daylight-pumped lasers in a general thermodynamic framework. The authors calculate that the requirements to reach threshold are that the Stokes shift of such a laser be greater than 13.3kT and that the absorption ratio of the pump/emission band and the geometrical aspect ratio both be greater than exp (13.3). The authors describe some luminescent material systems that might be able to satisfy these rigid requirements. (9 refs.)

66251 Gas laser with a phase anisotropy in an axial magnetic field for arbitrary relative excitation of the active medium. A.Ch.Izmailov (Engng. Phys. Inst., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1411-15 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2172-8 (Nov. 1982). [received: May 1983]
A theoretical analysis is made of the characteristics of a single-and two-mode gas laser with an anisotropic resonator in an axial magnetostatic field with arbitrary relative excitation of the active medium for an atomic transition with total level momenta of 0 and 1. Using an example of a homogeneously broadened spectral line, it is shown that the results of calculations made to within terms cubic with respect to the electric field give a correct qualitative description of the characteristics of two-mode lasing. (10 refs.)

66252 Natural fluctuations in a multimode standing-wave laser. V.R.Mironenko, V.I.Yudson (Inst. of Spectroscopy, Acad. of Sci., Troitsk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1452-7 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2234-43 (Nov. 1982). [received: May 1983]
It is shown theoretically that the relative fluctuations in the numbers of photons in individual modes of a multimode standing-wave laser with a homogeneously broadened gain profile is extremely sensitive to the degree of filling of the resonator with the active medium. If this medium fills the whole resonator, the spatial effects result in strong suppression of fluctuations in the individual modes. In the opposite case of a thin medium the statistical properties of a multimode standing-wave laser are close to those of a travelling-wave laser. The conclusions reached are used in an analysis of the quantitative discrepancy between the results of published experimental studies of the statistics of multimode lasing. (18 refs.)

42.55D CO_2 lasers

66253 Runaway self-absorption in multikilowatt CO_2 lasers. A.S.Kaye, D.L.Naylor (UKAEA Culham Lab., Abingdon, England).
Appl. Phys. Lett. (USA), vol.42, no.8, p.641-2 (15 April 1983).
Runaway self-absorption within a CO_2 laser cavity, recently reported at high pressure, has also been observed in a low pressure (50 mbar), multikilowatt CW CO_2 laser. A numerical model of the laser discharge is used to simulate the runaway absorption and gives results consistent with experiment. Runaway absorption is readily suppressed by eliminating regions of stagnant gas within the cavity. (3 refs.)

42.55F Inert gas lasers

66254 Heavy ion beam pumped He-Ar laser. A.Ulrich, H.Bohn, P.Kienle, G.J.Perlow (Dept. of Phys., Tech. Univ. Munchen, Garching, Germany).
Appl. Phys. Lett. (USA), vol.42, no.9, p.782-4 (1 May 1983).
A 100-MeV ^{32}S beam was used to pump a He-Ar gas laser. Laser action of the 1.79-μm line was observed above a threshold of 33-W beam power input. The light conversion efficiency is about 1×10^{-4} with a (88%)He-(1%)Ar gas mixture at 200-mbar pressure and 132-W input power. (4 refs.)

66255 Plamsa oscillations in an ion argon laser. I.E.Sakharov, S.V.Shatalin (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1363-6 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2218-23 (Nov. 1982). [received: May 1983]
Experimental results are reported concerning plasma instability in an ion argon laser. This instability, which was discovered in earlier work, limits the extent to which the gain can be increased by raising the electron temperature. The plasma instability is of the current cutoff type and is initiated by thermal instability resulting in linear pinching. In systems with a cold field emission cathode, beams of 'runaway' electrons may play an important role. (13 refs.)

42.55H Lasing action in other gas lasers

66256 Theoretical evaluation of the rare-gas diluent effects for an electron-beam-excited XeCl laser. F.Kannari, A.Suda, M.Obara, T.Fujioka (Dept. of Electrical Engng., Keio Univ., Yokohama, Japan).
Appl. Phys. Lett. (USA), vol.42, no.9, p.766-8 (1 May 1983).
The effect of various rare-gas diluents on the operating performance of the *e*-beam-excited XeCl laser is theoretically analyzed. The analysis of the XeCl* pumping process and the extraction process could solve the dependence of the intrinsic efficiency, small-signal gain, and absorption on the rare-gas diluent. As a result, there is no appreciable difference in the intrinsic efficiency between the Ar-based and the Ne-based mixtures. Selecting the optimum excitation parameters, the highest intrinsic efficiency of 5% is achieved for both diluents. Although the highest small-signal gain is achieved without a diluent gas, the extraction efficiency is reduced and the intrinsic efficiency is small due to the large amount of three-body collisional quenching. (11 refs.)

66257 A high-power, narrow linewidth XeCl* oscillator. O.L.Bourne, A.J.Alcock (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Canada).
Appl. Phys. Lett. (USA), vol.42, no.9, p.777-9 (1 May 1983).
A narrow linewidth ($\Delta\lambda$0.0004 Å) modular dye laser system has been constructed and used to investigate the gain characteristics of a XeCl* oscillator. When operated as a free-running oscillator lasing occurred simultaneously on the $B_{\nu=0}\rightarrow X_{\nu=1}$ and $B_{\nu=0}\rightarrow X_{\nu=2}$ transitions. The injection of 20 μJ of UV radiation from the dye chain was sufficient to confine the entire output to either one of these two transitions. A measured linewidth of 0.00004 Å was obtained at average power levels of up to 5 W. (18 refs.)

66258 FIR NH_3 cascade laser excited by a Q-switch laser. J.W.Won, G.D.Willenberg (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Appl. Phys. B (Germany), vol.B31, no.1, p.5-8 (May 1983).
Short FIR laser pulses of high repetition rate are obtained by pumping NH_3 with the pulses of a passively Q-switched IR laser. The two cascade laser transitions observed show coupled relaxation oscillations. The pulse shapes and delay times are qualitatively in agreement with a four-level rate-equation model. (17 refs.)

66259 Preionization kinetics of an X-ray preionized XeCl gas discharge laser. H.Shields (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada), A.J.Alcock, R.S.Taylor.
Appl. Phys. B (Germany), vol.B31, no.1, p.27-35 (May 1983).
The influence of preionization conditions on the performance of a XeCl gas discharge laser preionized by a short, high intensity X-ray pulse, has been studied. The laser output energy and optical pulse temporal characteristics have been used to determine the roles of initial electron density and of electron attachment to HCl and to impurities. Although the short pulse preionization technique functions well for XeCl when the laser voltage pulse has a short risetime ($\lesssim$20 ns), it is less well suited to XeCl lasers using slowly rising voltage pulses (>50 ns), or to F_2 containing gas mixtures (KrF and XeF lasers). (27 refs.)

66260 Effect of striations on the output characteristics of a He-Cd laser. V.A.Vaskov, S.A.Gonchukov, E.V.Kurbatov, E.D.Protsenko.
Opt. & Spectrosc. (USA), vol.53, no.3, p.320-1 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.544-6 (Sept. 1982). [received: May 1983]
The most likely mechanism for the effect of striations on the characteristics of the He-Cd laser is an additional two-step excitation of the working levels by fast electrons that appear when striations are crossed. The authors studied the waves in the plasma and their effect on the level populations and laser output within a narrow frequency interval, tunable over the entire range in which waves exist. By taking this approach they were able to study waves separately in the region in which striations exist and in which combinations of striations exist, and in addition were able to determine the roles played by these regions in the effect on the characteristics of the cataphoresis laser. It is concluded that an additional two-step excitation of levels by fast electrons occurs only when there are striation beats in the positive column of the discharge. The apparent reason for this effect is a substantial angular alignment of the electron velocities with the phase velocities of the waves in the plasma. (8 refs.)

66261 Excitation of laser transitions in parametallic gas mixtures using reaction products from nuclear reactions. A.B.Dmitriev, V.S.Il'yashenko, A.I.Mis'kevich, B.S.Salamakha.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1373-4 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2235-7 (Nov. 1982). [received: May 1983]
Luminescence is studied at high pressure in parametallic gas mixtures excited by products from neutron nuclear reactions. The use of ^{3}He-Cd, ^{3}He-Hg, and ^{3}He-Cs mixtures as active laser media pumped by nuclear reactions is considered. Quasicontinuous lasing in a ^{3}He-Cd mixture excited by a stream of neutrons is reported. (8 refs.)

42.55K Chemical lasers

(see also 82.40T Chemiluminescence and chemical laser kinetics)

66262 Enhanced HgBr($B^2\Sigma^+\rightarrow X^2\Sigma^+$) emission at low pressures. W.P.Lapatovich, G.R.Gibbs, J.M.Proud (GTE Labs., Inc., Waltham, MA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.792-4 (1 May 1983).
Additives of N_2 and I_2 vapour in diffuse $HgBr_2$ discharges have been observed to produce a large enhancement of radiated power due to $B^2\Sigma^+\rightarrow X^2\Sigma^+$ transitions at low pressures. The integrated power in the spectral range between 374 and 543 nm was recorded by means of an optical multichannel analyzer system. Optimization of the $B\rightarrow X$ radiation was investigated, and absolute efficiency was determined over a range of $|E|/N$. (13 refs.)

66263 Effects of optical irregularities in the active medium on angular divergence of a beam in a CW supersonic DF-CO_2 chemical laser. N.A.Konoplev, A.A.Stepanov, V.A.Shcheglov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1370-3 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2229-34 (Nov. 1982). [received: May 1983]
The effects of optical irregularities in the active medium caused by gas dynamic expansion on the divergence of the output light are studied by treating the example of a supersonic DF-CO_2 chemical laser in the amplification mode with a cylindrical nozzle unit and radial gas pumping. Direct calculations using the diffraction equations indicate that laser light divergence becomes much worse when such optical irregularities are present. Ways for reducing beam divergence under these conditions are discussed. (10 refs.)

42.55M Lasing action in liquids and organic dyes

66264 Laser dye stability. IX. Effects of a Pyrex UV filter and cover gases. A.N.Fletcher (Dept. of Res., Naval Weapons Center, China Lake, CA, USA).
Appl. Phys. B (Germany), vol.B31, no.1, p.19-26 (May 1983).
A figure-of-merit (FOM) consisting of the initial laser slope efficiency times the dye lifetime constant is used to compare the effect of a Pyrex light filter and the cover gas upon the output characteristics of six laser dye solutions. The FOM is found to improve using the Pyrex filter from 2-fold (coumarin 102 under air) up to 3800-fold (rhodamine 6 G under argon). In most cases, the use of argon in place of air for a coumarin dye not only improves the laser output, but also increases the lifetime constant. In order to measure long-lived dye solutions, a separate output-monitored linear flashlamp was used to degrade the solutions. The lifetime constants of the dye LD-490 measured by using the coaxial laser flashlamp was found to be comparable with, but lower than, the constants obtained from using the linear dye-degradation flashlamp. (24 refs.)

66265 Lasing characteristics of deoxygenated solutions of laser dyes. M.M.Asimov, V.N.Gavrilenko, A.N.Rubinov.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.769-73 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.49-54 (July 1982). [received: March 1983]
Values are presented of the molecular constants which regulate the populating (P_{32}) and deactivation (P_{21}) of the T_1 state of some laser dyes in oxygenated and degassed ethanol solutions. The removal of O_2 was achieved either by cyclic freezing with evacuation to an air pressure of $\sim10^{-3}$ torr or by saturating the solutions with helium for 30-40 min when it was impossible to work with sealed cuvettes. The spectroscopic parameters of the triplet state of the dye molecules were determined on a laser spectrophotometer. (20 refs.)

66266 Theoretical and experimental investigation of electronically excited states, luminescence properties, and lasing capability of pyrene and its phenylethynyl derivatives. O.K.Bazyl', G.V.Maier, T.N.Kopylova, V.I.Danilova.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.794-9 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.80-6 (July 1982). [received: March 1983]
The lasing action of the complex organic molecules has been investigated with the application of the theoretical methods of quantum chemistry, since such an approach makes it possible to establish the relationship between the lasing capability of molecules and their structure. (20 refs.)

66267 Photon conservation in flashlamp pumped dye lasers. R.H.Knipe (Res. Dept. Naval Weapons Center, China Lake, CA, USA).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.275-8 (May 1983).
A general representation of the laser output per pulse of the flashlamp is deduced from an equivalence between molecules populating the upper state of the lasing transition and coherent photons populating the active cavity modes. This representation is used to derive approximate expressions relating the slope efficiency and threshold to the losses associated with the laser system. (6 refs.)

66268 Nonlinear stochastic processes driven by colored noise: application to dye-laser statistics. S.N.Dixit, P.S.Sahni (Corporate Res.-Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1273-6 (25 April 1983).
The role of multiplicative colored noise on the photon statistics of the dye-laser output is investigated. This model explains consistently the recent experimental results by Short, Mandel, and Roy (1982). (10 refs.)

66269 Coumarin 6 as the active medium of a dye vapor laser with wide-band optical pumping and specific characteristics of such lasers. K.K.Trusov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1425-8 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2192-7 (Nov. 1982). [received: May 1983]
An experimental investigation was made of the efficiency of conversion of flashlamp pump radiation to fluorescence of coumarin 6 at a buffer gas pressure of 0-1 MPa. The lasing dynamics of the flashlamp-pumped vapor of this compound was also studied. It was found that the fluorescence quantum efficiency averaged over the absorption spectrum, which characterized the pump conversion efficiency, was $\langle\eta\rangle \leq 03$ at a buffer gas pressure of 0-1 MPa. Dependence of $\langle\eta\rangle$ and the rate constant for optical bleaching of the dye on the buffer gas pressure were determined. A comparative analysis of the lasing dynamics of coumarin 6 in vapors and in an ether solution showed that the gas phase had a higher lasing threshold (18-20 times higher) and a larger increment of loss growth in the spectral range of lasing (four times higher). It also has a shorter maximum lasing duration ($t_{max} \approx 500$ nsec). (9 refs.)

42.55P Lasing action in semiconductors with junctions

66270 On the linewidth enhancement factor α in semiconductor injection lasers. K.Vahala, L.C.Chiu, S.Margalit, A.Yariv (California Inst. of Technol., Pasadena, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.631-3 (15 April 1983).
A simple model for the linewidth enhancement factor α and its frequency dependence in semiconductor lasers is presented. Calculations based on this model are in reasonable agreement with experimental results. (12 refs.)

66271 Phase-locked (GaAl)As laser emitting 1.5 W CW per mirror. D.R.Scifres, R.D.Burnham, C.Lindstrom, W.Streifer, T.L.Paoli (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.645-7 (15 April 1983).
A phase-locked multiple quantum well (GaAl)As injection laser is demonstrated to emit over 1.5 W/mirror (>3 W total) CW output power at ~8350 Å with a maximum power conversion efficiency of 17.4%. (15 refs.)

66272 Twin-channel substrate-mesa-guide injection lasers fabricated by organometallic vapor phase epitaxy. D.E.Ackley, G.Hom (Hewlett-Packard Labs., Palo Alto, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.653-5 (15 April 1983).
An easily fabricated high-power index-guided laser, the twin-channel substrate-mesa-guide (TCSM) laser, has been developed for applications in recording, printing, and communications. The TCSM laser is fabricated by one-step organometallic vapor phase epitaxy (OMVPE) on photolithographically patterned and etched substrates. Linear output characteristics were observed to 40 mW CW with corresponding operation in zero order lateral and transverse modes and no astigmatism. Stable single longitudinal mode oscillation also resulted from the strong refractive index guiding produced by the nonplanar structure. (8 refs.)

66273 Photopumped low threshold $Al_{x''}Ga_{1-x''}As$-$Al_{x'}Ga_{1-x'}As$-$Al_xGa_{1-x}As$ ($x'' \sim 0.85$, $4ix' \sim 0.3$, $x=0$) single quantum well lasers. M.D.Camras, N.Holonyak,Jr., M.A.Nixon (Materials Res. Lab., Univ. of Illinois, Urbana, IL, USA), R.D.Burnham, W.Streifer, D.R.Scifres, T.L.Paoli, C.Lindstrom.
Appl. Phys. Lett. (USA), vol.42, no.9, p.761-3 (1 May 1983).
Data are presented showing that it is possible to photopump and operate a quantum well heterostructure laser at equivalent current densities (J_{eq}) as low as 70 A/cm^2. Continuous 300-K laser operation of a single 60-Å GaAs ($x=0$) quantum well the center of a ~0.12-μm-thick $x' \sim 0.30$ $Al_{x'}Ga_{1-x'}As$ waveguide (and carrier reservoir), which is confined by $x'' \sim 0.85 Al_{x''}Ga_{1-x''}As$ layers, is demonstrated at $I_{eq} \sim 0.4$ mA (168 W/cm^2, $J_{eq} \sim 70$ A/cm^2). These quantum well heterostructures are grown by organometallic vapor phase epitaxy. (14 refs.)

66274 High-frequency impedance of proton-bombarded injection lasers. B.W.Hakki, W.R.Holbrook, C.A.Gaw (Bell Labs., Murray Hill, NJ, USA).
Bell Syst. Tech. J. (USA), vol.62, no.2, pt.1, p.463-75 (Feb. 1983).
Experimental and theoretical results are given of an investigation of the capacitance behavior with frequency of GaAs injection lasers. It is shown that, for shallow-bombarded stripe geometry lasers, the zero-bias capacitance decreases rapidly beyond a certain frequency. This is interpreted in terms of confinement of the low-level radio frequency current under the stripe at high frequencies. Comparison of the experimental results with the analytically derived expressions provides a measure of the material resistivity adjoining the active region. This inferred material resistivity is shown to be in good agreement with results obtained by more direct measurements. Finally, the general conclusions are also applicable to other optoelectronic devices operating at high frequency, such as light-emitting diodes. (25 refs.)

66275 Feedback-induced noise in index guided semiconductor lasers and its reduction by modulation. K.Stubkjaer, M.B.Small (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Electron. Lett. (GB), vol.19, no.10, p.388-9 (12 May 1983).
The authors report a reduction in feedback noise of 15 to 20 dB by direct modulation of the laser with a 265 mA modulation current. The reduction is almost independent of modulation frequency in the frequency range from 50 MHz to 200 MHz, but depends on the external cavity length. The external cavity lengths considered are 5 to 15 cm. (7 refs.)

66276 Carrier transport in stripe-geometry $Ga_{1-x}Al_xAs$ double heterostructure diode lasers and broad area heterojunctions. A.Zemel, H.W.Willemsen, K.D.Anderson, F.R.Shepherd (Bell-Northern Res., Ottawa, Ontario, Canada).
J. Appl. Phys. (USA), vol.54, no.4, p.1981-7 (April 1983).
The current-voltage characteristics of stripe-geometry double heterostructure diode lasers and broad area heterojunctions of $Ga_{1-x}Al_xAs$ prepared by liquid-phase epitaxy have been extensively studied as a function of temperature and diode area to perimeter ratio. For stripe-geometry lasers, current-voltage measurements were made up to the lasing threshold (~10^4 A/cm^2). The carrier transport mechanisms in different ranges of current densities were identified and interpreted on the basis of existing models for *p-n* junctions. It is found that 2-kT current in combination with a tunneling current of the form $I\alpha \exp(T/T_0)\exp(AV)$ where T_0 and A are constants essentially independent of temperature, are the major contributions to the diode current at low forward bias. The 2-kT current is most probably due to surface recombination occurring at the junction perimeter and the tunneling current is most probably related to defects generated in the diode depletion region during epitaxial growth and/or sample processing. At medium forward bias, pure 1-kT current limited by the rate at which electrons can diffuse in the narrow gap *p*-type semiconductor is dominant. In the laser devices 2-kT current consistent with high injection conditions, is found at current densities near threshold. To the best of the authors' knowledge, this is the first time high injection behavior has been recognized and demonstrated in diode laser devices. (15 refs.)

66277 Astigmatism and spontaneous emission factor of laser diodes with parabolic gain. T.Mamine (Semiconductor Res. Dept., SONY Corp., Atsugi-shi, Japan).
J. Appl. Phys. (USA), vol.54, no.4, p.2103-5 (April 1983).
An explicit relation between the astigmatism and the spontaneous emission factor of gain guiding lasers has been derived with the assumption that the grain profile can be approximated to be a parabola or that the lowest order mode in the cavity is approximately Gaussian. The maximum value of the spontaneous emission factor is shown to be $\sqrt{2}$ if index guiding is dominant. Beyond $K=\sqrt{2}$, where gain guiding is dominant in this region, the astigmatism decreases with the spontaneous emission factor. It is also shown that the spontaneous emission factor of the gain guiding lasers does not much exceed ten and this conclusion has been confirmed experimentally for those whose stripe widths are larger than 4 μm. (8 refs.)

66278 A decisive state for laser diodes.
Mes. Regul. Autom. (France), vol.48, no.3, p.61-2 (7 March 1983). In French.
A new method of gas-phase growth of double-heterojunction GaAlAs, developed by the Thomson CSF central research laboratory, is described. It yields laser diodes with very low threshold and power consumption. The method should also permit epitaxy on to an InP substrate for the GaInAsP alloy base of 1.2 to 1.6 micron laser diodes. A threshold current density as low as 120 A/cm^2 for an optical cavity length of 1.8 mm is claimed. The 1000 Å thickness of the carrier recombination associated with conventional LPE is reduced to 60 Å with the aid of an epitaxial gas of organometallic compounds at reduced pressure. Excellent prospects for mass production by this method are foreseen. The use of proton implantation to produce a locally insulating region around the 5-micron active zone is explained diagrammatically. (no refs.) *M.B.D.*

66279 A classification scheme for the light-current (L/I) characteristics of a two photon mode semiconductor laser. S.J.Chua (Electrical Engng. Dept., Nat. Univ. of Singapore, Kent Ridge, Singapore).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.231-40 (May 1983).
The behaviour of a semiconductor laser in which two photon modes exist above threshold is analysed using the rate equations. The author classifies the different qualitative behaviour of mode competition by using a single parameter γ. The simplified analysis, neglecting electronic diffusion is sufficient to explain the experimental L/I characteristics of weak and strong polarization in semiconductor lasers which were previously treated theoretically using a power distribution model. (10 refs.)

66280 Chirp in picosecond film lasers and pulse compression by linear dispersion in optical fibers. J.M.Weisenfeld, J.Stone (Bell Labs., Holmdel, NJ, USA).
Opt. Lett. (USA), vol.8, no.5, p.262-4 (May 1983).
Time-averaged and time-resolved spectra of single-mode, optically pumped, ultrashort-cavity semiconductor film lasers have been studied in detail. The time-averaged spectra are broad (3-17 nm). Time-resolved spectra show that the lasing wavelength increases (chirps) during the picosecond-time-scale duration of the pulse. This chirp is due to free-carrier plasma effects on the refractive index of the highly excited semiconductor (<10^{20} carriers/cm^3). Film-laser pulses are compressed by a factor of 2 in an 8-m length of single-mode optical fiber because of the linear group-velocity dispersion of the fiber, producing a pulse of 3.7-psec duration at 1.264 μm. (19 refs.)

66281 Analysis of factors influencing the threshold current of $Pb_{1-x}Sn_xSe$ injection heterolasers. L.P.Bychkova, O.I.Davarashvili, P.G.Eliseev, M.I.Saginuri, R.I.Chikovani, A.P.Shotov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1391-7 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2140-50 (Nov. 1982). [received: May 1983]
An analysis is made of the factors which influence the threshold current in $PbSe/Pb_{1-x}Sn_xSe$ injection heterolasers. These factors include the waveguide structure, electron confinement, inhomogeneity of the distribution of the gain across the thickness, nonradiative recombination at the heterojunctions and in the bulk, and temperature. The conditions are identified under which anomalies can be expected in the temperature dependence of the threshold current because of the influence of free carriers on the refractive index. The results agree with the experimental values of the threshold current density for a surface recombination velocity of ~2×10^5 cm/sec and an internal quantum efficiency of ≤0.1. (18 refs.)

42.55R Lasing action in other solids
(inc. solid Raman lasers)

66282 **Laser oscillation at 3.53 μm from Fe^{2+} in n-InP:Fe.** P.B.Klein, J.E.Furneaux, R.L.Henry (Naval Res. Lab., Washington, DC, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.638-40 (15 April 1983).
Using pulsed optical excitation ($h\nu > E_g$), the authors have observed laser oscillations at 3.53 μm from the internal d-shell transitions of Fe^{2+} in n-type InP:Fe. The semiconducting nature of the InP host plays an important role in the pumping of the Fe^{2+} excited state, which occurs via the capture of a conduction-band electron by Fe^{3+} created during the exciting pulse. (8 refs.)

66283 **Amplification in a solid-state gamma-ray laser.** V.I.Vysotskii, V.I.Vorontsov.
Kvantovaya Elektron., Kiev (USSR), no.23, p.3-8 (1982). In Russian.
The authors examine the mutual influences of excited and unexcited nuclei on the resonance reaction cross section ratio. It is shown that as a consequence of the difference between the magnetic moments of the ground- and excited-state nuclei there occurs a displacement and broadening of the resonance transition line. For an ordered lattice such an effect leads to the resonance gamma-ray absorption cross section changing by a factor of 10-1000 or more for a given amplification cross section. The possibility of applying such an effect in a non-threshold gamma-ray laser is discussed. (8 refs.)

66284 **Concerning the mechanism of laser generation, the thickness of the active layer, the effects of natural resonances and the nature of the M and P-bands in CdS emission spectra during excitation by a nitrogen laser.** A.A.Kipen', N.I.Yanushevskii, N.I.Vitrikhovskii.
Kvantovaya Elektron., Kiev (USSR), no.23, p.9-22 (1982). In Russian.
Investigates the emission spectra (spontaneous and stimulated, including the generation regime) and the amplification spectra of CdS (at temperatures of 4.2-420K) during excitation by a nitrogen laser, taking into account the influence of the natural cavity resonator of the specimen on its recombination spectra at high excitation levels. It is concluded that the dominant mechanism giving rise to laser generation in the CdS is radiative electron-electron inelastic scattering. The thickness of the active layer is evaluated for a wide range of excitation levels. A new point of view is expressed on the nature of the most characteristic bands arising in the radiation of strongly excited single crystals of CdS. (33 refs.)

66285 **Development of colour centre lasers for spectroscopy applications.** G.Baldacchini, G.P.Gallerano (ENEA Frascati, Roma, Italy), D.Censi, M.Tonelli, P.Violino, U.M.Grassano, M.Meucci, A.Scacco.
Rev. Phys. Appl. (France), vol.18, no.5, p.301-6 (May 1983).
The description of two home-built colour centre lasers is presented. Technical details of the solutions are given with special concern to the production of the F_A(II) centres in KCl:Li crystals. The fluorescence properties of these centres are briefly investigated and an example of application to molecular spectroscopy is shown. (29 refs.)

66286 **Selective pulsed pumping of the active elements of a powerful neodymium laser.** N.G.Basov, N.E.Bykovskii, V.V.Ivanov, V.I.Kozlovskii, A.S.Nasibov, Yu.V.Senatskii, G.V.Sklizkov.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.47-52 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.54-9 (1982).
Considers the possibility of selective pumping of the active elements of a powerful neodymium laser by the radiation of semiconducting structures excited by short electron pulses. (11 refs.)

42.55T Free electron lasers

66287 **Free-electron lasers and their applications.** P.Dobiasch (Max-Planck-Inst. fur Quantenoptik, Garching, Germany), K.L.Hohla, P.Meystre.
Opt. & Lasers Eng. (GB), vol.4, no.2, p.91-119 (1983).
Reviews the classical theory of the free-electron laser and discusses possible applications in laser fusion, laser-induced chemistry, biochemistry, and solid-state physics. The possibility of using optical wigglers to reach the VUV and soft X-ray regimes is also analysed. (25 refs.)

66288 **Model of the Cerenkov laser.** J.Soln (Harry Diamond Labs., US Army Electronics Res. & Dev. Command, Adelphi, MD, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2036-40 (April 1983).
A model of the (wigglerless) Cerenkov laser through the S matrix approach is given. Here the classical electron current due to electrons with straight trajectories interacts with a quantized radiation field in a refractive medium of finite extent. The multiphoton distribution function gives the mean photon multiplicity which in turn yields the gain at a given frequency. The imposition of the quantum recoil yields the full 'quantum mechanical' gain from which the usual 'classical' gain follows. In an example where the radiation wavelength is 2.5 mm and the refractive index 1.8, estimate the maximum gain to be about 20%; this suggests that the Cerenkov laser may be an effective radiation source. The effect of the finite interaction time of the gain calculation and a new, possible quantum, effect of residual photons are also discussed. (8 refs.)

66289 **Highly nonlinear theory of the free electron (Compton) laser. Exact equations.** V.A.Zhurakhovskiy.
Radio Eng. & Electron. Phys. (USA), vol.27, no.5, p.108-13 (May 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.5, p.965-71 (May 1982). [received: April 1983]
A specialized system of differential equations of state is formulated for the relativistic electrons of a provisionally rectilinear beam, subject to the resonant action of a group of transverse elliptically polarized high-intensity waves in the presence of a supplementary longitudinal electromagnetic field. This system is an exact physical model of a multiwave magnetically focused free electron (Compton) laser under large-signal conditions. The entire variety of resonances for such a device are analyzed qualitatively, and it is shown, ultimately, that a large frequency conversion coefficient and a high efficiency are alternative regimes. (18 refs.)

66290 **Highly nonlinear theory of the free-electron (Compton) laser. Average equations.** V.A.Zhurakhovskiy.
Radio Eng. & Electron. Phys. (USA), vol.27, no.5, p.114-19 (May 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.5, p.972-8 (May 1982). [received: April 1983]
A smoothed system of differential equations of state of the relativistic electrons of a provisionally rectilinear beam, underlying the resonance action of a group of transverse elliptically polarized high-intensity waves in the presence of an additional longitudinal electromagnetic field, is obtained in a second approximation of the averaging method for several rapidly rotating phases, extended to an abnormally large range of variation of the independent variable of the order of the inverse square of the small parameter. This system is an adequate mathematical model of a multiwave magnetically focused free-electron (Compton) laser in large-signal modes of operation. (2 refs.)

Parametric interaction and backward wave oscillation in stimulated Compton scattering .... See Entry 66331

42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

66291 **Measurement of laser beam divergence.** J.Falk (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Appl. Opt. (USA), vol.22, no.8, p.1131-2 (15 April 1983).
Demonstrates a simple technique that can determine beam divergence for even a single shot of a pulsed laser. The divergence determined is the far-field divergence even if the measurement is made in the laser's near field. Divergence is recorded by propagating the laser beam through a birefringent crystal placed between a polarizer-analyzer pair. The input polarizer is set to pass light polarized at ~45° to the crystal's ordinary axis so that light propagates with approximately equal amplitudes of ordinary and extraordinary polarizations. (10 refs.)

66292 **Heat load limits in laser mirrors with a cooled porous backing.** V.V.Kharitonov, A.A.Plakseev (Moscow Engng. Phys. Inst., Moscow, USSR).
High Temp. (USA), vol.20, no.4, p.594-9 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.712-17 (July-Aug. 1982). [received: April 1983]
A simple model is proposed for the analysis of the thermal state of laser mirrors with porous cooling. The maximum possible heat fluxes that can be removed in the porous structure without boiling of the coolant are estimated. It is shown that for water flowing at high velocity through a finely dispersed porous medium the heat fluxes removed can be well in excess of 10 MW/m^2. (4 refs.)

Experimental investigation of the characteristics of a planar surface discharge .... See Entry 66774

42.60B Design of specific laser systems

66293 **Demonstration of multilevel multichannel optical frequency shift keying (FSK) with cleaved-coupled-cavity (C^3) semiconductor lasers.** W.T.Tsang, N.A.Olsson, R.A.Logan (Bell Labs., Murray Hill, NJ, USA), R.A.Linke.
Electron. Lett. (GB), vol.19, no.9, p.341-3 (28 April 1983).
Reports the first demonstration of multilevel multichannel (4-level, 2-channel) optical frequency shift keying (FSK) using a newly developed cleaved-coupled-cavity (C^3) GaInAsP semconductor laser operating at ~1.3 μm. This is made possible because of the very large frequency tuning rate (~10 Å/mA) and frequency tuning range (~150 Å) achievable with these new lasers. In addition, such a laser is also shown to operate in a highly stable single-longitudinal model even under high-speed direct frequency modulation. (6 refs.)

66294 **Manufacturing the laser tube [for measurement system].** R.H.Grote (Hewlett-Packard Co., Palo Alto, CA, USA).
Hewlett-Packard J. (USA), vol.34, no.4, p.17-18 (April 1983).
Describes the manufacture of a He-Ne laser for Hewlett-Packard's HP 5528A Laser Measurement System. It is shown how careful design of the manufacturing process was used to control the quality of this product. (no refs.)

66295 **Mechanical design features of the laser head.** C.R.Steinmetz (Hewlett-Packard Co., Palo Alto, CA, USA).
Hewlett-Packard J. (USA), vol.34, no.4, p.19-20 (April 1983).
Describes the design of mechanical parts for the laser head of Hewlett-Packard's HP 5528A Laser Measurement System. Emphasis was on low-cost parts for most components and fabrication processes were selected with this in mind. Another major consideration was easy replacement and repair in the field. (no refs.)

66296 **A quadruple transmission line nitrogen laser.** P.Persephonis, B.Giannetas, R.Rigopoulos (Lab. de Phys. II, Univ. de Patras, Patras, Greece).
Rev. Phys. Appl. (France), vol.18, no.5, p.295-300 (May 1983).
Theoretical considerations on the advantages of a quadruple parallel-plate transmission line nitrogen laser comparatively to a double transmission line one are given. Experimental verification shows that from a double line N_2 laser to a quadruple one, an increase of the peak power and energy per pulse about 50% and 70% respectively exists. A common spark-gap is used. Experimental curves show the peak power increase versus pressure and repetition rate. The quadruple transmission line can be used in any other TE N_2 laser and other discharge gas lasers. (20 refs.)

66297 The application of 'organometallic' technology to the growth of GaAs/GaAlAs laser structures. M.Baldy, S.D.Hersee, P.Assenat (Lab. Central de Recherches, Thomson-CSF, Orsay, France).
Rev. Tech. Thomson-CSF (France), vol.15, no.1, p.5-37 (March 1983). In French.
Describes the means used to optimize the technique of organometallic growth of GaAs/GaAlAs lasers emitting at a wavelength of 0.85 μm. It is shown that it is possible to obtain good laser structures in reproducible fashion and with satisfactory uniformity. Furthermore, using a new structure (the 'GRIN SCH'), it proved possible to achieve the lowest threshold current density ever reported for a semiconductor laser -121 A cm^{-2} for a 1800 μm-long chip. (11 refs.)

66298 Carbon dioxide laser with sequential transitions and a composite resonator. V.P.Avtonomov, V.N.Bel'tyugov, A.A.Kuznetsov, V.N.Ochkin, N.N.Sobolev, M.V.Spiridonov, Yu.V.Troitskii, Yu.B.Udalov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1400-2 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2155-9 (Nov. 1982). [received: May 1983]
An analysis is made of the problem of selection of sequential transitions ($00^0\nu_3 \rightarrow [10^0\nu_3\text{-}1, 02^0\nu_3\text{-}1]$) in CO_2 lasers. A new method is proposed in which sequential transitions are selected using a composite resonator formed by a diffraction grating and a diffraction reflecting interferometer. In contrast to a CO_2 laser with a heated cell, the use of a composite resonator makes it possible to construct a more compact sequential CO_2 laser and to ensure rapid switching of lasing between the main and sequential transitions. Measurements are reported of the gain for the main and sequential transitions and of the populations of the CO_2 molecular levels. (13 refs.)

66299 Characteristics of a pulsed chemical laser utilizing an H_2-F_2 mixture and initiated by radiation from an XeCl excimer laser. E.B.Gordon, V.I.Matyushenko, V.D.Sizov.
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1420-4 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2186-92 (Nov. 1982). [received: May 1983]
A study was made of the influence of the active mixture composition on the energy and temporal characteristics of an HF laser, for various diluents (He, Kr, Xe, N_2, SF_6). An efficiency of 1500%, measured relative to the ultraviolet initiation energy deposited in the mixture, was achieved utilizing an $F_2{:}O_2{:}H_2{:}SF_6=7.5{:}0.75{:}2.5{:}3.5$ mixture at $p=110$ Torr. The specific output energy increased in proportion both to the initiation energy (i.e. keeping the efficiency constant) and to the concentration of the fuel mixture (for a given initiation energy). An output energy of 38 J/liter was achieved for an $F_2{:}O_2{:}H_2{:}SF_6=25{:}2.5{:}2.5{:}20$ mixture ($p=0.5$ atm) with a concentration of atoms created by the ultraviolet radiation of $[F]_0 \sim 2\times10^{16}\ \mathrm{cm}^{-3}$. (9 refs.)

66300 Investigation of CW operation of a GaAs laser pumped by an electron beam. V.I.Kozlovskii, A.S.Nasibov, P.V.Reznikov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1437-40 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2211-16 (Nov. 1982). [received: May 1983]
An experimental investigation was made of the dependences of the power and threshold characteristic of an electron-beam-pumped CW GaAs laser on the concentration and nature of the dopant, thickness of the semiconductor plate, reflection coefficient of the mirrors, diameter of the electron beam, and cryostat temperature. An output power of 20 mW was recorded and the output radiation was found to have a divergence of less than 10° and a spectral width not exceeding 1 nm. (9 refs.)

66301 Influence of Lorentz broadening on the stability of monomode ring lasers. P.Mandel (Service de Chim. Phys., Univ. Libre de Bruxelles, Bruxelles, Belgium).
Opt. Commun. (Netherlands), vol.45, no.4, p.269-72 (15 April 1983).
The author carries out a linear stability analysis of the stationary solutions describing in the frame of the semiclassical theory a Lorentz broadened single running mode in a ring laser. The author looks for the conditions of destabilisation via a Hopf bifurcation and proves that it can occur only in a bad cavity. The threshold intensity is very high when homogeneous broadening dominates, it is of the order of a few saturation intensities when homogeneous and inhomogeneous widths are comparable and it tends to zero as the inhomogeneous width increases well beyond the homogeneous width. 42.60F Laser beam modulation

66302 High-speed direct single-frequency modulation with large tuning rate and frequency excursion in cleaved-coupled-cavity semiconductor lasers. W.T.Tsang, N.A.Olsson, R.A.Logan (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.650-2 (15 April 1983).
The authors report a new mechanism of direct frequency modulation, the cavity-mode enhanced frequency modulation (CME-FM), using the newly developed cleaved-coupled-cavity (C^3) semiconductor laser. In this operation, one of the diode of the C^3 laser was operated as a laser, while the other diode was operated as a frequency modulator. It was shown that a very large frequency excursion of 150 Å and frequency tuning rate of 10 Å/mA have been obtained with a C^3 GaInAsP crescent laser operating at 1.3 μm. Time-resolved spectral and spectral-resolved pulse response measurements also showed that such C^3 lasers operated in highly stable single-longitudinal mode at all times even under high-speed direct frequency modulation. In addition to the important application as the optical source in FM optical communication systems, the present CME-FM C^3 laser can also be used as the optical source in wavelength-division multiplexing systems. Further, it opens the possibility of ultrahigh capacity multilevel optical FM information transmission systems. (16 refs.)

66303 Generation of a series of narrow-band huge pulses in a laser with an electrooptical shutter. A.V.Agashkov, Yu.F.Morgun.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.763-8 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.42-8 (July 1982). [received: March 1983]
The possibility of the generation of a series of narrow-band huge pulses in a neodymium laser is demonstrated. An electrooptical shutter with photoelectric control was used to modulate the Q-factor of the laser. (12 refs.)

66304 Analysis of mode locking by synchronous pumping of a gain medium with long decay time. Z.A.Yasa (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Opt. Lett. (USA), vol.8, no.5, p.277-9 (May 1983).
Analytical expressions are given to describe the pulse characteristics and the mode-locking regime for the synchronously pumped laser with a radiative lifetime≥cavity round-trip time. (6 refs.)

42.60H Optical problems related to properties and interactions of laser beams

66305 Gas-lens effect and cavity design of some frequency-stabilized He-Ne lasers. P.Cerez (Lab. de l'Horloge Atomique, Univ. de Paris-Sud, Orsay, France), R.Felder.
Appl. Opt. (USA), vol.22, no.8, p.1251-6 (15 April 1983).
It is shown that there exists an optical cavity length which should minimize the frequency shifts induced by lenslike effects in intracavity saturated absorption lasers. Ideas are developed which provide a satisfactory explanation for the dispersion in modulation shifts observed in some recent laser intercomparisons. (19 refs.)

66306 Amplification and measurement of single 1.6-3.5 ps pulses generated by a distributed feedback dye laser. G.Szabo, Z.Bor (Dept. of Experimental Phys., Jozsef Attila Tudomanyegyetem Univ., Szeged, Hungary), A.Muller.
Appl. Phys. B (Germany), vol.B31, no.1, p.1-4 (May 1983).
The authors have shown that distributed feedback dye lasers are capable of generating single transform-limited pulses of 1.6-3.5 ps duration when pumped by a mode-locked Nd:YAG laser. A short-pulse amplifier has been constructed in which the level of amplified spontaneous emission could be kept below 10^{-3} by properly taking into account the polarization anisotropy of the gain and by precise timing of the pump pulses. A sensitive autocorrelator is also described which allows one to measure pulse duration in a single shot. (16 refs.)

66307 Comparison between the $^{127}I_2$ stabilized He-Ne lasers at 633 nm and 612 nm of the BIPM and the IMGC. F.Bertinetto (Istituto di Metrologia G. Colonnetti, Torino, Italy), P.Cordiale, G.B.Picotto, J.-M.Chartier, R.Felder, M.G.Glaser.
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.72-6 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
In November 1981, a comparison between BIPM ('Bureau International des Poids et Mesures') and IMGC ('Istituto di Metrologia G. Colonnetti') He-Ne lasers stabilized to saturated absorption lines of $^{127}I_2$, at the wavelengths $\lambda=633$ nm, and $\lambda=612$ nm has been made at the BIPM. At 633 nm, a repeatability and a reproducibility within $+1\times10^{-11}.\nu$ have been obtained. At 612 nm, a repeatability within a few $10^{-11}.\nu$ only for one laser and a reproducibility of $\pm2\times10^{-10}.\nu$ have been obtained. (10 refs.)

66308 International intercomparison of laser power measurements in the visible region. M.Endo, T.Honda (Electrotech. Lab., Sakuramura, Ibaraki, Japan).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.77-81 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Describes results of the international intercomparison of He-Ne and Ar-ion laser power measurements. The intercomparison measurements were of He-Ne laser power of 3 mW at the wavelength of 633 nm and Ar-ion laser power of 200 mW at 488 nm and 515 nm. The participating laboratories coincided within deviation from the average of 0.6 percent at 633 nm, 0.8 percent at 488 nm, and 0.9 percent at 515 nm. (3 refs.)

66309 Results of international comparisons using methane-stabilized He-Ne lasers at 3.39 μm and iodine-stabilized He-Ne lasers at 633 nm. J.-M.Chartier (Bur. Internat. des Poids et Mesures, Sevres, France).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.81-3 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
The results of international comparisons of methane-stabilized He-Ne lasers at $\lambda=3.39$ μm and iodine-stabilized He-Ne lasers at 633 nm, made by heat frequency techniques, between Bureau International des Poids et Mesures (BIPM) and eleven national laboratories are presented. Generally, the measured frequency differences were inside $\pm 4\times 10^{-11}$; but greater frequency differences were observed with some iodine cells (probably as a result of contamination) or when the output power of one laser was two or three times greater than the power of the other laser. (20 refs.)

66310 Dye laser spectrum narrowing by 'double pulse' flashlamp pumping. M.N.Nenchev, A.Y.Gisbrekht (Inst. of Electronics, Bulgarian Acad. of Sci., Sofia, Bulgaria).
Opt. Commun. (Netherlands), vol.45, no.4, p.266-8 (15 April 1983).
A novel simmple 'two-step lasing' technique for flashlamp dye laser spectrum narrowing is proposed. The laser spectrum is locked by double pulse pumping at the preliminary narrowed prepulse emission. As an example the waveguide flashlamp pumped dye laser is discussed. (18 refs.)

66311 Significance of intra-cavity power density in synchronous mode-locking of CW-dye lasers. J.Kluge, D.Wiechert, D.von der Linde (Univ. Gesamthochschule-Essen, Essen, Germany).
Opt. Commun. (Netherlands), vol.45, no.4, p.278-80 (15 April 1983).
It is shown that there is a well-defined relation between the intra-cavity power density and the temporal structure of ultrashort light pulses generated by a synchronously pumped CW dye laser. To obtain pulses of good quality with high output power the beam cross-section in the lasing medium must be large, because the best performance is achieved at low power density. (10 refs.)

66312 Laser fluctuation studies in intensity dependent absorption of light. V.Harwalkar, H.Bohidar, S.Chopra (Phys. Dept., Indian Inst. of Technol., New Delhi, India).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.241-5 (May 1983).
The interaction of a laser with an intensity-dependent absorber has been analysed for discrete regions of operations of the laser. It is shown that the beam is thermally defocused due to absorption for the values of intensity under consideration. The fluctuation properties have been analysed by evaluating $\langle I\rangle$, $\langle I^2\rangle$ and $\langle(\Delta I)^2\rangle/\langle I\rangle^2$. (9 refs.)

66313 Estimation of the minimum laser linewidth achievable with a grazing-grating configuration. E.Armandillo (CNEN, Casaccia, Italy), G.Guiliani.
Opt. Lett. (USA), vol.8, no.5, p.274-6 (May 1983).
The influence of beam divergence on second-order grating dispersion terms is found and discussed. It is shown that divergence in the plane normal to the plane of incidence sets the lowest limit of the achievable linewidth. By using a double-grating configuration to achieve both spectral narrowing and tuning, one can obtain a laser linewidth down to ≈0.01 Å in a discharge-pumped XeF laser. (12 refs.)

66314 Modal analysis of separate-confinement heterojunction lasers with inhomogeneous cladding layers. W.Striefer, R.D.Burnham, D.R.Scifres (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA).
Opt. Lett. (USA), vol.8, no.5, p.283-5 (May 1983).
Separate-confinement heterostructure lasers with thin active regions are analyzed. For four different interior-cladding-region refractive-index spatial variations, i.e. step, triangular, parabolic, and inverted parabolic, waveguide modes are calculated and thresholds are compared. Based on optical considerations alone, the step-index profile has the lowest threshold; however, for optimum cladding thicknesses the differences are not great. (14 refs.)

66315 Diffraction splitting of frequencies in a ring laser with a misaligned quadratically homogeneous active element. A.Ya.Birman, A.F.Savushkin, V.A.Solomatin, E.N.Tropkin.
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1465-9 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2256-64 (Nov. 1982). [received: May 1983]
The diffraction splitting of frequencies of the opposite waves in a ring laser with a quadratically inhomogeneous active element is calculated for the case of weak diffraction. The dependences of the frequency splitting on the mode index, length of the active element, and its position along the resonator axis are determined. A study is made of the influence of misalignment of a quadratically inhomogeneous active element on the diffraction effects in ring lasers with resonators containing even and odd numbers of mirrors. 66316 Regularizing the solution of the laser sounding equation of atmospheric aerosols by means of a stabilizing functional. S.I.Kavkyanov, N.N.Momerov, V.I.Tsanev (Inst. of Electronics, Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.12, p.1661-3 (1982). (4 refs.)

66317 Laser optical components for machine tool and other calibrations. R.R.Baldwin, L.E.Truhe, D.C.Woodruff (Hewlett-Packard Co., Palo Alto, CA, USA).
Hewlett-Packard J. (USA), vol.34, no.4, p.14-16, 18, 20-2 (April 1983).
Describes optical components to be used with Hewlett-Packard's HP 5528A Laser Measurement System for calibrating machine tools and other things. Included are: the linear interferometer; angular optics; the straightness interferometer; the post, height adjuster and base for optics positioning; a levelling plate mount for the turning mirror; a straightness accessory kit; optical square; flatness mirror; tripod-to-laser adaptor plate. Computer modelling of the system is also described. (2 refs.)

66318 The accuracy of distance measurements with laser pulse. E.Popescu, N.D.Grosu, Gh.Stoenescu, L.Teodorescu (Inst. de Fizica si Tehnologia Aparatelor cu Radiatii, Bucuresti, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.34, no.9, p.871-85 (1982). In Rumanian.
Describes the properties of pulsed laser range-finders, which are affected by the receiver pulse shape. The effect of atmospheric scintillation on the accuracy of an optical pulsed range-finder as well as on the probability of its detection is examined. This analysis has been made assuming that photoemission of the detectors is described by Poisson statistics. The decrease in the strength of returned pulse, the distortion and the time delay of the electrical pulse after photoelectric conversion, and the resolution of the time interval counter, as well as the fluctuation of the atmospheric index of refraction can be limitation factors of the accuracy of optical pulsed measurements. Methods for improving measurement accuracy are discussed. (18 refs.)

66319 Optimal regime for forming topological patterns when processing films with laser radiation. V.P.Veiko, I.M.Karpman, M.N.Libenson, E.B.Yakovlev (Inst. of Precision Mech. & Optics, Leningrad, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1408-11 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2167-72 (Nov. 1982). [received: May 1983]
The results are given of an experimental investigation of the physical and technological laws governing the formation of individual precision components in thin films, and of the synthesis of these pattern components using the contour-projection method. A study was made of the influence on the quality of the synthesized pattern of the degree of overlapping of the neighboring components. The results of the experiments were used to establish the fundamental limitations of this method. A method is proposed for selecting the optimal processing regime. (9 refs.)

42.65 NONLINEAR OPTICS

66320 Nonlinear optical coupling between radiation and confined modes. G.M.Carter, Y.J.Chen (GTE Labs. Inc., Waltham, MA, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.643-5 (15 April 1983).
Equations are developed which describe the coupling between radiation and confined (guided wave or surface plasmon) modes in the presence of an intensity-dependent index of refraction. Solutions are presented for three numerical examples and comparisons are made with asymptotic solutions. The authors find that under certain conditions, the addition of the nonlinear index drastically alters the coupling and gives rise to the possibility of optical switching. Experimental parameters for optimizing such switching are discussed. (11 refs.)

66321 Blocking oscillation of optical bistable devices using DC drift phenomena of $LiNbO_3$ waveguide. J.Yumoto, H.Yajima, S.Ishihara, Y.Sekiguchi, K.Yamaya (Electrotech. Lab., Ibaraki, Japan), M.Nakajima.
Appl. Phys. Lett. (USA), vol.42, no.9, p.780-2 (1 May 1983).
Graphical solutions and experimental results of the blocking oscillation of the guided-wave optical bistable devices using DC drift phenomena of $LinbO_3$ are reported. The frequency of the oscillation can be varied in the range from 0.1 to 100 Hz by changing bias voltage and input light level. (8 refs.)

66322 Two-photon optical multistability theory. Li Fu-li (Dept. of Phys., Univ. of Sci. & Technol. of China, Hefei, China).
Acta Phys. Sin. (China), vol.32, no.1, p.71-83 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The theory of the optical multistability by two-photon resonant interaction is investigated. The nonlinear medium inside a Fabry-Perot cavity is in two-photon resonance with the laser beam. The two-photon equation of state including dynamical Stark shift and relaxation parameters is obtained and studied under mean-field approximation. The equations for both Fabry-Perot cavity and ring cavity take basically the same form. The physics mechanisms resulting in optical multistability are also studied. It has been shown that the combined effects of Kerr switching and saturation absorption switching can lead to two-photon optical double-bistability, tristability as well as bistability. Furthermore, the criterion conditions under which double-bistability or tristability can occur are given and discussed. Finally, the phase-conjugated reflectivity by two-photon four-wave mixing is also shown to exhibit multistability as well as hysteresis. (9 refs.)

66323 Reading and writing of photochemical holes using GaAlAs-diode lasers. P.Pokrowsky, W.E.Moerner, F.Chu, G.C.Bjorklund (IBM Res. Lab., San Jose, CA, USA).
Opt. Lett. (USA), vol.8, no.5, p.280-2 (May 1983).
A current-tuned GaAlAs-diode laser is utilized both to burn and to detect narrow photochemical holes in the inhomogeneously broadened 833-nm zero-phonon line of the R' color center in LiF. Applications for reading and writing data into frequency-domain optical memories based on photochemical hole burning are discussed. (10 refs.)

66324 Optically bistable switching of a semiconductor resonator with a 30 ps pulse. S.D.Smith, C.T.Seaton, M.E.Prise, W.J.Firth, F.Tooley, C.R.Pidgeon (Phys. Dept., Heriot-Watt Univ., Edinburgh, Scotland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.413-15 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors report the bistable switching of a 200 μm thick InSb Fabry-Perot resonator, using a single 30 ps switched-out pulse from a Nd:YAG mode-locked laser. The device has been made to act as an 'optical memory', and, by splitting and delaying one part of the pulse, as an optical AND gate. (5 refs.)

66325 Optical bistability observed in amorphous semiconductor films. J.Hajto, I.Janossy (Central Res. Inst. for Phys., Budapest, Hungary).
Philos. Mag. B (GB), vol.47, no.4, p.347-66 (April 1983).
The optical properties of amorphous self-supporting $GeSe_2$ films show strong non-linear behaviour under the influence of relatively low-intensity CW laser irradiation. Discontinuities, bistability and, in special circumstances, oscillation in the optical properties have been found. The importance of thermal effects is experimentally proved. A theoretical model is constructed which explains some of the experimental findings. Evidence is presented, however, that, as well as thermal effects, photostructural changes also play an important role in the bistability and oscillatory phenomena. (19 refs.)

66326 Optical bistable circuits. F.Hoff.
Slaboproudy Obz. (Czechoslovakia), vol.44, no.3, p.145-7 (March 1983). In Czech.
Typical characteristics of optical bistable systems (OBS) are presented. The operation of a dispersive Fabry-Perot resonator is examined and the principle of a hybrid OBS system with an electrooptical crystal placed in the Fabry-Perot resonator is examined. OBS systems without an electrooptical feedback which require the use of nonlinear optical material are then dealt with. The principles of two types of nonlinearity—reactive and absorption—are discussed. Applications of OBS as switching devices for fully optical circuits are considered. (1 ref.) *E.D.*

66327 Optical radiation filtration with nondegenerate four-photon interaction. V.V.Ivakhnik (Kuibyshev State Univ., Kuibyshev, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.765-7 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.97-9 (Aug. 1982). [received: April 1983]
The effects of frequency shift between incident and reflected waves, conversion efficiency, and positive feedback coefficient on quality of wave-front rotation are studied for the nondegenerate four-photon interaction. (6 refs.)

42.65B General theory

66328 Boundary-value problems in nonlinear optics of resonant media. V.I.Rupasov, V.I.Yudson (Inst. of Spectroscopy, Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1415-19 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2179-86 (Nov. 1982). [received: May 1983]
A study is made of the problem of transmission of light pulses by a boundary of a nonlinear medium under conditions of coherent interaction with matter. It is shown that in the case of a semiinfinite nonlinear medium the reflection coefficient is governed by the linear characteristics of the media in contact so that the boundary-value problem reduces to the Cauchy problem. In another case, when a nonlinear medium is a thin film at the interface between two linear media, it is found that such a film is an almost perfect mirror reflecting weak pulses but it becomes transparent to pulses of sufficiently high intensity and the mirror then modulates the amplitude of such pulses. (8 refs.)

42.65C Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation

66329 Application of the inverse scattering transform method to SBBS in an inhomogeneous medium: the Zakharov-Manakov solution. R.H.Enns (Dept. of Engng. Phys., Australian Nat. Univ., Canberra, Australia).
Can. J. Phys. (Canada), vol.61, no.4, p.604-11 (April 1983).
The inverse scattering transform method has been applied to the stimulated Brillouin backscattering (SBBS) interaction in a weakly spatially inhomogeneous medium. Specifically, the Zakharov-Manakov problem has been solved for examples of both an amplifier and a generator experimental setup yielding the complete spatial and temporal evolution of the light pulses involved. The structure of the resulting pulse shapes is discussed and the results compared with those in the literature. (15 refs.)

66330 Time oscillations of the amplification coefficient during induced Raman scattering of light in the polarised and non-polarised regime. F.N.Marchevskii, L.L.Strizhevskii, V.P.Feshchenko, Yu.V.Kholodenko.
Kvantovaya Elektron., Kiev (USSR), no.23, p.44-8 (1982). In Russian.
Theoretically investigates the possibility of an optical nutation effect developing during non-stationary Raman scattering of light at polaritons. The conditions under which the nutation effect causes time oscillations in the amplification coefficient are examined. The characteristic time dependence of the amplification coefficient for wave and frequency detuning is investigated. (9 refs.)

66331 Parametric interaction and backward wave oscillation in stimulated Compton scattering. A.Gover (Faculty of Engng., Tel-Aviv Univ., Tel-Aviv, Israel).
Opt. Commun. (Netherlands), vol.45, no.4, p.281-4 (15 April 1983).
Stimulated Compton-Raman scattering and free electron lasers are formulated as parametric (four-photon) or three-wave interaction processes. Manley-Rowe relations and depletable pump equations are derived for both free electron lasers and optical klystron schemes. A process of backward wave oscillation is predicted when a pump radiation field is back scattered off a codirectionally propagating e beam with frequency down conversion. A practicable experiment in the optical regime is proposed to demonstrate this effect. (15 refs.)

66332 Three-frequency Raman-amplification source (theory). N.E.Kornienko, A.M.Steba, V.L.Strizhevskii.
Opt. & Spectrosc. (USA), vol.53, no.3, p.336-7 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.568-9 (Sept. 1982). [received: May 1983]
Derives a theory for the steady-state generation and amplification of Stokes and anti-Stokes waves in gaseous media with Raman and parametric processes, saturation effects, and a possible difference between the Raman polarizabilities of the Stokes and anti-Stokes waves (χ_s and χ_a, respectively; the difference may be caused, particularly, by single-photon quasi-resonances or interacting waves). The authors assume that the pump wave and the Stokes wave ω_s (for the anti-Stokes waves ω_a) are applied to the entrance to the nonlinear medium [either inverted ($n<0$) or noninverted ($n>0$)]. (1 ref.)

66333 Effect of the spectral width of a two-photon pump on parametric frequency upconversion in metal vapor. A.V.Aleksandrov, S.A.Pleshanov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.337-9 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.570-2 (Sept. 1982). [received: May 1983]
The authors are interested in how the efficiency of the four-photon parametric frequency conversion of the signal ω_1 into the sum frequency $\omega_2=2\omega_p+\omega_1$ depends on the spectral width of the two-photon pump ω_p. To obtain theoretical estimates in the case of a broadband pump the authors use an averaging method based on successive approximations in terms of small parameters. (6 refs.)

66334 Line shape of anti-Stokes stimulated Raman scattering in organic dye solutions. V.I.Petrov, Ya.S.Bobovich.
Opt. & Spectrosc. (USA), vol.53, no.3, p.342-3 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.577-9 (Sept. 1982). [received: May 1983]
Using a solution of the polymethine dye 3,3′-diethylthiatricarbo-cyaniniodide (DTTC) in dimethylformamide (DMF), the authors demonstrate that the interference mechanism is important in shaping the resonant stimulated Raman scattering (RSRS) lines even in the case of different secondary emission centres. The interference of these two processes for light conversion is, therefore, a rather general property of molecules in an intense coherent light field. (7 refs.)

66335 Intracavity generation of second harmonics and sum frequencies in $LiIO_3$ crystal in an infrared He-Ne laser. F.Kaczmarek, A.Jendrzejczak (Quantum Electronics Lab., A. Mickiewicz Univ., Poznan, Poland).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.187-91 (May 1983).
Several second harmonics and sum frequencies were generated in a phase-matched $LiIO_3$ crystal placed within an optical cavity of a high-power He-Ne infrared laser operated at 1.15 μm. (12 refs.)

66336 Propagation in media with Raman-type nonlinearity: polarization states of the waves and gains. G.Rivoire, C.Deslancs, J.L.Ferrier, J.Gazengel, N.Phu Xuan (Lab. d'Optique des Fluides, Angers, France).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.209-16 (May 1983).
The simultaneous propagation of laser and Raman waves through nonlinear media is theoretically studied using the nonlinear third-order susceptibility tensor formalism. Polarization states and gains with linearly, circularly and elliptically exciting polarizations are calculated. The theoretical expressions are compared with experimental results in the absence of self focusing. The perturbations due to self focusing near the stimulated Raman scattering thresholds are studied and conclusions concerning the anisotropy of the Kerr constant are obtained. (12 refs.)

66337 Squeezed states in second-harmonic generation. L.A.Lugiato, G.Strini (Istituto di Fisica, Milano, Italy), F.De Martini.
Opt. Lett. (USA), vol.8, no.5, p.256-8 (May 1983).
The authors consider the process of second-harmonic generation with the nonlinear crystal placed in a resonant cavity. Both the fundamental and the second-harmonic mode are shown to exhibit squeezing. An analysis is made for general values of the ratio between the damping constants of the two modes. The authors suggest that second-harmonic generation is the most suitable system to use for an experimental observation of the squeezing effect. (14 refs.)

66338 Generation of continuous-wave radiation near 243 nm by sum-frequency mixing in an external ring cavity. B.Couilalaud, L.A.Bloomfield, T.W.Hansch (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
Opt. Lett. (USA), vol.8, no.5, p.259-61 (May 1983).
The authors have generated up to 1 mW of single-mode CW ultraviolet radiation between 243 and 247 nm by mixing the outputs of an ultraviolet argon-ion laser at 363.8 nm and a red LD700 dye laser in ammonium dihydrogen phosphate. The dye-laser intensity within the crystal is enhanced by using an actively locked passive ring cavity. Wavelengths near 243.1 nm are of particular interest for the high-resolution two-photon spectroscopy of atomic hydrogen. (6 refs.)

66339 Nonlinear generation of the guided mode in an anisotropic thin-film optical waveguide. E.Weinert-Raczka (Inst. of Phys., Tech. Univ. of Szczecin, Szczecin, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.195-203 (1982).
Describes nonlinear generation of the guided mode utilizing phase matching among the two radiation modes of frequencies ω_1 and ω_2 and the guided mode generated of the frequency $\omega_3=\omega_1-\omega_2$. The situation described is restricted to weak harmonic generation, the pump power depletion being neglected. (9 refs.)

66340 Non-local aspects of second harmonic generation at a metal surface. P.Apell (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).
Phys. Scr. (Sweden), vol.27, no.3, p.211-16 (March 1983).
A general non-local expression for the second harmonic generated current in a metal is derived within an explicit spatially dependent quadratic response formalism. In the limit of an instantaneous response earlier hydrodynamical results are corroborated. Surface sensitivity and spatial extension of the induced current are discussed. Gauge invariance is used to express the second harmonic current only of the electric and magnetic fields instead of the gauge-dependent potentials A and θ. (37 refs.)

66341 Investigation of electronic stimulated Raman scattering of excimer laser radiation by metal atoms. V.S.Verkhovskii, V.M.Klimkin, V.E.Prokop'ev, V.F.Tarasenko, V.G.Sokovikov, A.I.Fedorov (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1397-400 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2151-5 (Nov. 1982). [received: May 1983]
An experimental investigation was made of stimulated Raman scattering (STRS) of excimer laser radiation in barium, thulium, and europium vapors. The energy of XeF* laser radiation (λ=351 nm) converted to the yellow range (585 nm) in barium vapor was 6 mJ and the conversion efficiency was ~39%. The spectral composition of the converted radiation is governed by the STRS, by four-wave parametric processes, and also by lasing due to the natural barium transition. Selection of the pump frequencies is required to concentrate the converted radiation at a single frequency and to reduce its divergence. Stimulated Raman scattering of XeCl* laser radiation (λ=308 nm) was achieved in thulium vapor at λ=422 nm. In europium vapor in quasiresonance with the $6s^2\ {}^8S_{1/2}{}^0$-$5d^2\ {}^{10}P_{11/2}{}^0$ forbidden transition, stimulated emission was obtained due to the natural $5d^2\ {}^{10}P_{11/2}{}^0$-$6s6p\ {}^{10}P_{11/2}$ and $5d^2\ {}^{10}P_{11/2}{}^0$-$6s6p\ {}^{10}P_{3/2}$ transitions. (9 refs.)

66342 Intracavity second harmonic excitation under the action of an external signal on a Q-switched solid-state ring laser. G.V.Krivoshchekov, V.I.Samarin (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1440-3 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2216-20 (Nov. 1982). [received: May 1983]
A theoretical analysis is made of the energy parameters of the second harmonic under conditions of intracavity excitation in a *Q*-switched ring laser. It is shown that the proposed laser system is potentially useful under the action of an external signal which ensures unidirectional extraction of the harmonic. (10 refs.)

42.65F Phase conjugation

66343 Comments on Shakir's 'zero-area optical pulse processing by degenerate four-wave mixing'. B.R.Suydam, R.A.Fisher (Univ. of California, Los Alamos Nat. Lab., Los Alamos, NM, USA).
Opt. Commun. (Netherlands), vol.45, no.4, p.285-7 (15 April 1983).
The authors disagree with one of the contentions of Shakir's paper (see ibid., vol.40, p.151, 1981), namely that a zero-area pulse can be generated by an unstable phase conjugator. The authors find, on the contrary, that any unstable conjugator would, if the pumps were not depleted, generate a conjugate wave of infinite area. The authors show by counterexample that the response generated by Shakir's technique is noncausal if the conjugator is unstable. (4 refs.)

66344 Study of dynamical effect using phase conjugation of light waves. M.I.Stockmann (Inst. of Automation Electrometry, Siberian Branch of the USSR Acad. of Sci., Novosibirsk, USSR).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.430-3 (4 April 1983).
New effects are predicted which appear at the phase conjugation of a light wave transmitted through a dynamical optical system (nonstationary medium). The theory of these effects is developed and their relation with the dynamical form factor of the system is established. The predicted effects may be used as a basis of a new optical method for studying fast processes in matter which does not require either short light pulses or fast photodetectors. (9 refs.)

66345 Level crossing effect in degenerate four-wave mixing. Fu Pangming, Mi Xin (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.1, p.133-8 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
Third-order nonlinear susceptibility $\chi^{(3)}$ $(-\omega;\ \omega,\ \omega,\ -\omega)$ is calculated in nearly-degenerate quasi-two-level system by perturbation method. The authors have studied the level crossing effect in degenerate four-wave mixing and compared it with the level crossing effect in resonance fluorescence. The possibility of using level crossing effect in degenerate four-wave mixing to measure the relaxation rate of upper and lower state is pointed out. (8 refs.)

66346 Current state of experimental studies of resonance media by the photon-echo method. V.V.Samartsev (Kazan Physicotech. Inst., Acad. of Sci., Kazan, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.524-37 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.100-12 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
Examines the phenomenon of photon echo and its applications. Particular attention is devoted to the current state of experimental studies of resonant media (mostly activated crystals) by this and other optical transition phenomena with characteristic time constants τ_e that are smaller than or comparable with the longitudinal (T_1) and irreversible transverse (T_2) relaxation times. In addition to the photon echo, these phenomena include free induction, self-induced transparency, and nutation. The analogs of some of these phenomena are well-known in radio-frequency spectroscopy, where they have been found to be very promising from the standpoint of spectroscopic and technological applications. (74 refs.)

66347 Coherent phenomena during the interaction between light pulses and resonance media. E.A.Manykin, S.O.Elyutin, S.M.Zakharov, V.N.Likhachev, A.I.Maimistov (Moscow Engng. Phys. Inst., Moscow, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.538-56 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.113-29 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
The study of coherent processes occurring during the interaction between ultrashort light pulses and resonant media is now an extensive and rapidly advancing branch of nonlinear optics. The problems surveyed by the authors constitute only a part of this branch of physics. The phenomenon of the photon echo of complex shape, coherent processes during two-photon resonance, and the derivation of rigorous analytic results by the inverse scattering method have a relatively short history but now form an independent field of study. Progress has been achieved in this area as a result of the systematic inclusion of inhomogeneous broadening and nonlinear propagation effects in the analysis of the evolution of ultrashort pulses in the medium, both in space and in time. (87 refs.)

66348 Light echo in gases. A.I.Alekseev, A.M.Basharov (Moscow Engng. Phys. Inst., Moscow, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.557-73 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.130-44 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
Discusses echo spectrometry in gaseous media, concentrating attention on those investigations that have been generally accepted or advanced promising proposals. Photon echo is the spontaneous coherent emission by atoms after the excitation of a resonant medium by a sequence of two or more exciting pulses of light. The photon echo in gases is often found to have a different appearance as compared with solids. This is connected with the thermal motion of the atoms, the degeneracy of the energy levels, and atomic collisions. The use of the photon echo in gaseous media appears to be particularly promising. The authors demonstrate the advantages of using the photon echo in nonlinear laser spectroscopy. (56 refs.)

66349 Light-induced gratings of coherent superposition states of atoms. E.I.Shtyrkov (Kazan Physicotech. Inst., Kazan, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.579-85 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.149-54 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
It is possible to induce spatial gratings by electromagnetic fields that are separated in time by an interval much greater than their duration, which essentially excludes direct interference between these fields. The formation of gratings in a resonant medium under such conditions is among the so-called transient quantum phenomena because it is based on the interference between coherent atomic superposition states produced in such a way that an ensemble of atoms that has been subjected to coherent and resonant excitation has a phase memory for the excitation coherence. The different properties of transients such as nutation, photon echo, coherent transmission, and scattering of light, and so on in relation to the direction and time of appearance of coherent responses are due to the properties of the dynamic spatial gratings of coherent states which modulate all the parameters of the medium. (18 refs.)

66350 Two-photon self-induced transparency and diffraction phenomena. V.D.Gora, A.P.Sukhorukov, T.Shlegel (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.593-9 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.162-7 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
Reports the results of a numerical study of self-induced transparency (SIT) under the conditions of two-photon resonance. The authors studied the space-time evolution of light packets and have found the conditions for coherent self-focusing that must be satisfied by the beam width, the pulse length, the detuning from resonance, and the pulse area on the beam axis. They have also investigated the dynamic stark effect as well as the self-focusing and the defocusing of short light pulses under adiabatic conditions. (22 refs.)

66351 Reversed photon echo in ruby. V.A.Zuikov, V.V.Samartsev, R.G.Usmanov (Kazan Physicotech. Inst., Kazan, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.600-3 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.168-71 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
Reports an investigation of a new optical coherent response, namely, the reversed photon echo (RPE) which substantially extends spectroscopic and technological applications of the photon echo technique. The medium under investigation was ruby (${}^4A_2$-${}^2E(\bar{E})$ transition) with chromium ion concentration of 0.05 wt.%. The measurements were performed at 2.2K. (14 refs.)

66352 Light-beam scanning and coherent transient processes. R.A.Vlasov, E.V.Doktorov, V.S.Kuz'min (Inst. of Phys., Acad. of Sci., USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.604-8 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.172-6 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
The examples of self-induced transparency (SIT) and photon echo are used to examine coherent transient processes produced with scanned beams. In addition to translational scanning, the authors also examine conical scanning and analyze possible applications of the latter in studies of the narrowing of lines broadened by dipole-dipole interactions. (10 refs.)

66353 Self-induced transparency with the participation of excitons and biexcitons in semiconductors. S.A.Moskalenko, P.I.Khadzhi, A.Kh.Rotaru, E.S.Kiseleva (Inst. of Appl. Phys., Acad. of Sci., Moldavian SSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.609-13 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.177-81 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
Notes some of the features of nonlinear coherent interaction between light and excitons. The starting point for the theoretical analysis of self-induced transparency (SIT) in the exciton part of the spectrum is the set of nonlinear equations for the amplitude *a* of the exciton wave and the wave equation for the vector potential A^+. From the equations for the envelopes, the authors deduce, by introducing additional physical conditions, the shape of the field and exciton pulses, the amplitude, the time distribution, the velocity and area of pulses, and also the dispersion relation for the carrier wave $\omega(k)$. These properties appear when only the exciton-exciton interaction is taken into account. (6 refs.)

66354 A classical model of the photon echo. V.P.Chebotayev, B.Ya.Dubetsky (Inst. of Thermophys., Acad. of Sci., Novosibirsk, USSR).
Appl. Phys. B (Germany), vol.B31, no.1, p.45-52 (May 1983).
An observation and the theory of a nonlinear response in the ensemble of nonlinear classical oscillators excited by two field pulses—similar to the phenomenon of a photon echo in optics—are reported. It has been shown that an echo arises in any ensemble with an inhomogeneously broadened line regardless of the type of interaction with a field (classical or quantum). New peculiarities appear during the determinate distribution of frequencies in the ensemble. On the one hand, an echo pulse is observed with a relatively small (about 100) number of oscillators N, on the other, new pulses spaced at a distance that is proportional to N arise in the nonlinear response. (4 refs.)

66355 Experimental test of the optical Bloch equations for solids. R.G.DeVoe, R.G.Brewer (IBM Res. Lab., San Jose, CA, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1269-72 (25 April 1983).
This paper provides the first experimental test of the Bloch equations for an optical transition in a low-temperature impurity-ion solid, $Pr^{3+}:LaF_3$, where the condition $T_1 \gg T_2$ applies. Intensity-dependent optical free-induction-decay measurements are performed by use of an ultrastable CW dye laser (linewidth, 300 Hz) and reveal an $\exp(-2T/T_2)$ decay law at low Rabi frequency (χ), as predicted by the Bloch equations, and an $\exp(-\chi t)$ decay at high χ, which violates the Bloch prediction but agrees with Redfield's characterization (1955) of NMR saturation in solids. (16 refs.)

66356 Optical bleaching in tellurium. L.S.Dubinskaya, A.D.Galetskaya, I.I.Farbshtein (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1536-41 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2709-18 (Sept. 1982). [received: April 1983]
Optical bleaching in tellurium was investigated at 20 and 90K near the fundamental absorption edge, which is subject to the Urbach rule if pumping in by a helium-neon laser. An approximate expression is obtained for bleaching with an interband transition, which gives a fairly accurate description of both the amount of bleaching and the dependences of the effect on frequency, temperature, and sample thickness. Analysis of the results leads to the conclusion that the Urbach blurring of the absorption edge is due to static defects of the dislocation type. Estimates are made of the surface and bulk recombination velocities of nonequilibrium carriers in tellurium with quadratic recombination. (19 refs.)

66357 Theory of the self-induced transparency of surface and waveguide solutions. V.M.Agranovich, V.I.Rupasov, V.Ya.Chernyak (Inst. of Spectroscopy, Acad. of Sci., Troitsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1693-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2992-9 (Oct. 1982). [received: April 1983]
A theory of the self-induced transparency of surface electromagnetic waves and waveguide solutions which are in resonance with oscillations is developed for a transition layer. The transition layer is described using a model of a two-dimensional gas of two-level systems. A surface (waveguide) soliton solution [surface (waveguide) 2π pulse] is obtained and the dependences of the duration of such a soliton pulse on the permittivities of the media in contact and on the properties of the transition layer are discussed. The polarization of a transition layer normal to the interface is considered. The behavior of a surface soliton under the conditions when the surface density of two-level systems in a transition layer varies along the interface of the two media is studied. (5 refs.)

66358 Anti-reflection coatings for electro-optic elements made out of KH_2PO_4, GaAs and CdTe crystals. I.E.Kacher, Yu.Yu.Firtsak, N.I.Dovgoshei.
Kvantovaya Elektron., Kiev (USSR), no.23, p.101-4 (1982). In Russian.
The authors have developed two-layer antireflection coatings based on the chalcogenide films Ge-As(Sb)-S(Se) and the fluorides CaF_2, MgF_2, BaF_2 and PbF_2 for electro-optic elements used in the near-IR. The best combinations of coatings are chosen and the reflection spectra of the coated elements are calculated. The proposed coatings have high chemical stability and optical strength. (12 refs.)

66359 Rutherford backscattering evidence for solid phase laser annealing of Corning 7059 glass and ZnO thinfilsm. S.Dutta, H.E.Jackson (Dept. of Phys., Univ. of Cincinnati, Cincinnati, OH, USA), J.T.Boyd, C.W.White.
J. Appl. Phys. (USA), vol.54, no.4, p.2125-6 (April 1983).
Rutherford backscattering meaurements have been made on ZnO and Corning 7059 glass optical waveguides before and after laser annealing to investigate whether melting is associated with the dramatic improvement in scattering loss which occurs after laser annealing. These measurements indicate that no redistribution of impurities takes place during annealing. The authors conclude that no melting occurs and that the annealing occurs in the solid phase. (5 refs.)

66360 Chalcogenide glasses—promising materials for quantum electronics. I. Interaction and structure of glasses in the As-S system. V.V.Khiminets.
Kvantovaya Elektron., Kiev (USSR), no.23, p.64-80 (1982). In Russian.
Systematically classifies a large amount of work on interaction and glassification in the As-S system. The structure of glassy and crystalline compounds and alloys which are promising for use in quantum electronic devices and optical information processing is discussed. (55 refs.)

66361 Detection of platinum atoms in optical glasses by a light scattering method. S.Gebala (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland), J.Sarzynski.
Opt. Appl. (Poland), vol.12, no.2, p.257-60 (1982).
Pt^0 in glass evokes an increased absorption within the whole visible range, which causes the glass to grow grey. This effect follows from the light scattering and depends on the sizes and concentrations of the molecules. Pt^0 is a good nucleator and easily creates heterogeneous dispersive colloidal particles responsible for the scattering of light. Under these circumstances the authors deal with the colloidal scattering and colloidal change in glass colour. The measurement results of the light transmission, the scattered light intensity and the coefficient of the polarized scattered light for the glasses melted in ceramic and platinum crucibles are presented. The results have been obtained by using comparative methods. To prepare the glasses for examination a part of the glass melted in ceramic was next remelted in a platinum crucible and then both parts were annealed. (5 refs.)

66362 Future lenses for 16-mm cinematograph projectors. K.D.Sharma (Instrument Design Dev. Centre, Indian Inst. of Technol., New Delhi, India).
Appl. Opt. (USA), vol.22, no.8, p.1188-91 (15 April 1983).
Designs of two-lens systems for use as 16-mm cinematograph projector objectives have been developed at a focal length of 50 mm and relative apertures of $f/1.4$ and $f/1.2$, respectively. The 50-mm $f/1.4$ system is comprised of five elements, and the 50-mm $f/1.2$ system is comprised of six elements. The proposed designs are not based on any known configuration, but their forms are arrived at from a hybrid approach combining the good points of some of the better known systems. The proposed systems are capable of giving extremely good performance, which has not been possible so far in the lenses of the same complexity in current use. (4 refs.)

66363 Evaluation of wave aberrations of objectives. III. Analysis of lateral shearing interferograms. Experimental results. B.Dubik (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.151-63 (1982).
For pt.II see ibid., vol.11, no.3, p.425-30 (1981). A setup to test the objective is presented in which lateral shearing interferograms are produced. The method for analysis of the obtained interferograms as well as the block scheme of the programme calculating the objective wave aberrations are given. The experimental and numerical results are presented in tables and graphs. (5 refs.)

66364 Chromatic aberration of a system of holographic lenses produced on non-plane surfaces. A.Kijek (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.173-8 (1982).
The dependence determining the chromatic aberrations of a system of an arbitrary number of holographic lenses produced on the rotationally symmetric surfaces of second degree has been derived. A method of designing an achromatic system of holographic lenses is presented. (5 refs.)

66365 Numerical analysis of the aberration for selected examples of holographic lenses on non-plane substrates. A.Kijek (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.179-87 (1982).
The applicability of the formulae describing the coefficients of third order aberration in analysis of aberration values is shown for chosen examples of holographic lenses produced on non-plane substrates. The influence of particular parameters of the holographic system on the real value of aberration is

shown. The relation describing the sphero-chromatic aberration is derived and its exemplified values calculated. (6 refs.)

66366 Testing the quality of the operating surface of a parabolic devitrified glass astronomical mirror. D.T.Puryaev, V.A.Gorshkov, O.N.Fomin, V.G.Lysenko.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.475-8 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.7-9 (Aug. 1982). [received: April 1983]
A method is described for certifying a 2.6-m diameter parabolic devitrified glass mirror in a vertical testing scheme by means of an IKAP-2 interferometer having a universal compensator in the measuring arm. The vertical testing scheme is given along with the schematic of the interferometer, an interferogram and topographical map of the operating surface of the mirror. (4 refs.)

66367 Calculation of Fresnel optical lens elements. Yu.K.Vifanskii.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.490-3 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.19-23 (Aug. 1982). [received: April 1983]
A method is presented for calculating the construction parameters of Fresnel optical lens elements, which determine their basic optical characteristics, for an arbitrary position of the source and its image with respect to the optical axis of the system and an arbitrary inclination of the element to the optical axis. The lens elements are calculated for viewing instrument. The optical characteristics of the instrument having such lens elements match the calculation data. A three-dimensional space perception is achieved when viewing is done with two eyes. (5 refs.)

66368 Universal measuring tube for testing telescope systems. M.A.Ostrovskaya, O.A.Pronina.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.496-9 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.25-8 (Aug. 1982). [received: April 1983]
The construction of the IFK-7 measuring tube, designed for measuring the optical characteristics and geometrical aberrations of telescopic systems and also for evaluating the quality of the image produced by these systems, is described. A method is given for calculating the components of the optical system of a measuring tube having improved optical characteristics. (2 refs.)

66369 A monocular camera based measurement system using the thin lens approximation. M.E.Hinkey, R.M.Inigo (School of Engng. & Appl. Sci., Univ. of Virginia, Charlottesville, VA, USA).
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.180-4
The growing industrial trend towards automation requires reliable and accurate measurement processes. The use of a monocular TV camera system and the thin lens approximation is an alternative to be considered for some applications. This paper shows one simple implementation of this approach to two-dimensional measurement. (7 refs.)

66370 Specification and tolerancing of reflective test systems for IR and visible use. D.A.Byrd, J.H.Ward.
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.185
Summary form only given, as follows. The increased use of infrared lasers, thermal imaging systems and infrared instrumentation has renewed interest in simple reflective systems. This paper describes four such systems: a) spherical collimators; b) parabolic collimators; c) Dall-Kirkham telescopes; d) Schwartzchild microscope objectives. Reflective systems have found use in a variety of test and alignment, system integration, boresight, resolution, MTF and MRTD measurements, and laser beam divergence and power measurements. Reflective components offer several advantages. They can be accurately tested and aligned with visible light insuring good performance throughout the near and mid infrared wavelength region. They have good transmission over wide band widths; and large apertures often exceeding 12 inches are practical. The main disadvantage is field of view. This restriction can be worked with by understanding the limitations of each type of system. The authors discuss the geometric limitations of each class of systems, comparing them to each other as well as to the ideal theoretically diffraction limited system. Applications of each type are described. The effect of random surface errors is related to system image spot size. Optical surface tolerances are illustrated by examples of interferograms, spot sizes and system specifications. (no refs.)

66371 Proposal of electro-optical switching and memory devices utilizing doping and undoping processes of conducting polymers. K.Yoshino, K.Kaneto, Y.Inuishi (Faculty of Engng., Osaka Univ., Suita, Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L157-8 (March 1983).
New optical switching and memory elements utilizing the spectral change of conducting polymers by electrochemical doping and undoping are proposed. (12 refs.)

66372 Use of focused light beams in schlieren instruments for studying randomly inhomogeneous media. M.B.Kashevnik, Yu.I.Kopilevich.
Opt. & Spectrosc. (USA), vol.53, no.3, p.314-17 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.535-40 (Sept. 1982). [received: May 1983]
The application of focused light beams in schlieren instruments with photoelectric recording used in studies of turbulent media is considered theoretically. The effect of wavefront curvature of the initial beam on the sensitivity and resolution of the instruments with different types of schlieren stops is analyzed. It is shown that the optimum selection of beam curvature can substantially improve the information potentials of the instruments with even transmission functions of the schlieren stops. (8 refs.)

66373 Magneto-optical bistable device. I.M.Popescu, A.G.Podoleanu, P.E.Sterian (Dept. de Phys., Inst. Polytech. de Bucarest, Bucarest, Rumania).
Rev. Phys. Appl. (France), vol.18, no.5, p.313-15 (May 1983). In French.
The authors present a mixed magneto-optical bistable device, realized in the active cavity of a laser by applying an axial magnetic field, the field being driven electronically by means of a feedback loop. (8 refs.)

66374 Background rejection in schlieren visualization. P.B.Nagy (Appl. Biophys. Lab., Tech. Univ. Budapest, Budapest, Hungary).
Ultrasonics (GB), vol.21, no.3, p.107-8 (May 1983).
It was recently suggested that an image orthicon could be used as a two-dimensional array of lock-in amplifiers. This technique enables rejection of extraneous optical signals from images of periodic phenomena, and the suitability of the method to improve schlieren images of ultrasonic beams is verified by experimental results. (7 refs.)

66375 Boresighting collimators using laser unequal path interferometry. R.B.Sartain (Martin Marietta Aerospace, Orlando, FL, USA), C.E.Halford, W.T.Smith, C.W.Bray.
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.169-73
A technique is presented for boresighting two separate collimators by using a laser unequal path interferometer. The analysis indicates that the accuracy of the technique approaches ten microradians with an approximate resolution of less than ten microradians. Experimental evidence is presented to support the analysis. (4 refs.)

66376 Composite thin-foil bandpass filter for EUV astronomy: titanium-antimony-titanium. P.Jelinsky, C.Martin, R.Kimble, S.Bowyer (Space Sci. Lab., Univ. of California, Berkeley, CA, USA), G.Steele.
Appl. Opt. (USA), vol.22, no.8, p.1227-31 (15 April 1983).
Thin metallic foils of antimony and titanium have been investigated in an attempt to develop an EUV filter with a bandpass from 350 to 550 Å. A composite filter has been developed composed of antimony sandwiched between two titanium foils. The transmissions of sample composite foils and of pure titanium foils from 130 to 1216 Å are presented. The absorption coefficients of antimony and titanium and the effect of titanium oxide on the transmission are derived. The composite filter has been found to be quite stable and mechanically rugged. Among other uses, the filter shows substantial promise for EUV astronomy. (11 refs.)

66377 Discussion of the relative efficiency in the vacuum ultraviolet of diffraction gratings with laminar, sinusoidal, and triangular grooves. J.M.Lerner (Instruments SA Inc., Metuchen, NJ, USA), J.Flamand, A.Thevenon, M.Neviere.
Opt. Eng. (USA), vol.22, no.2, p.220-3 (March-April 1983).
A study was conducted using electromagnetic theory to determine the parameters necessary to optimize laminar groove gratings for use in the vacuum ultraviolet. This study predicted that the absolute efficiency of correctly optimized laminar and sinusoidal groove gratings should be about the same, and that triangular groove gratings should show higher efficiency. For the example calculated, it was shown that when compared to a triangular groove grating, laminar grooves should show far superior higher order attenuation at wavelengths around blaze and be better or equal up to about twice the blaze wavelength. From then on, the triangular profile is better. Actual results measured showed good correlation with predicted values. (8 refs.)

66378 **Broadband guided-wave optical frequency translator using an electro-optical Bragg array.** R.H.Kingston, R.A.Becker, F.J.Leonberger (Lincoln Lab., MIT, Lexington, MA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.759-61 (1 May 1983).
The authors describe a new type of optical frequency translator which utilizes Bragg diffraction from a traveling index wave produced by an interdigitated electrode grating on a $LiNbO_3$ surface waveguide. The grating is driven by a three-phase electrical signal that results in a unidirectional wave with a fixed Bragg angle determined by the electrode spacing. The diffraction thus produces a single-sideband suppressed carrier optical output. Measurements at 10 and 100 MHz have yielded greater than 90% carrier-to-sideband conversion efficiency with over 100:1 suppression of the carrier and unwanted sideband. The device should be operable from arbitrarily low frequencies up to several gigahertz. (6 refs.)

66379 **Spatial light modulator.** H.Nishihara (Faculty of Engng., Osaka Univ., Osaka, Japan).
J. Inst. Telev. Eng. Jpn. (Japan), vol.36, no.12, p.1068-75 (Dec. 1982). In Japanese.
A light input type spatial modulator with ITC elements is described with an optical system structure, performance parameters, basic operation, BSO pockels readout and crystal and microchannel plate types. Electrical input type spatial light modulators are not yet available but digital types under development are reviewed. Some applications are treated including recording of holographic color video, real time correlative processing filtering (Mitsubishi and Sumitomo), projection display (GE,IMB) and image computation and processing using optical logic gates. (25 refs.)

66380 **Resolution and sensitivity of a spatial and temporal light modulator with an anisotropic electrooptic crystal.** V.B.Baglikov, V.V.Kolchin, O.N.Krasnopevtseva, T.V.Petrova.
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1461-5 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2249-56 (Nov. 1982). [received: May 1983]
Calculations are reported of the solution and sensitivity of a spatial and temporal light modulator which is controlled optically with the aid of an anisotropic electrooptic crystal. The influence of a dielectric mirror is allowed for. It is shown that a calculation carried out using a simplified model employed in earlier work overestimates the results. The calculated data are compared with the experimentally determined modulator parameters. (8 refs.)

42.80L Optical waveguides

(for fibre optical waveguides, see 42.80M)

66381 **Index instabilities in proton-exchanged $LiNbO_3$ waveguides.** A.Yi-Yan (CNET, Bagneux, France).
Appl. Phys. Lett. (USA), vol.42, no.8, p.633-5 (15 April 1983).
Measured effective mode indices on a day to day basis reveal an oscillatory behavior which indicates that the index profile of proton-exchanged $LiNbO_3$ waveguides evolves as a function of time. It is suggested that the profile instability might be brought about by a continuous migration of protons within the thickness of the guiding layer. Some index profile modification may also be introduced during fabrication due to structural changes in the crystal as a function of exchange time. (4 refs.)

66382 **A comparative study of the dopant profiles in diffused planar optical waveguides by SIMS and guided wave probe.** R.A.Betts, C.W.Pitt, K.R.Riddle, L.M.Walpita (Dept. of Electronic & Electrical Engng., Univ. Coll. London, London, England).
Appl. Phys. A (Germany), vol.A31, no.1, p.29-35 (May 1983).
A technique has been developed for dopant concentration depth profiling using static Secondary Ion Mass Spectrometry (SIMS), and an ex-situ ion milling facility to produce 'tapers' through the region of interest of an optical waveguide sample. Results have been obtained for titanium-diffused optical waveguides in lithium niobate and for potassium and caesium ion-exchanged glass waveguides. The SIMS profiles have been compared with refractive index profiles in multimode structures. The refractive index profiles have been obtained from the waveguide mode spectra by a piecewise linear Wentzel-Kramers-Brillouin (WKB) method. The two profiles are in close agreement. Use of the SIMS technique for single-mode Ti:$LiNbO_3$ waveguides has revealed significant changes in the forms of the profiles, compared with deeper structures, and the authors suggest a mechanism to account for these changes. (22 refs.)

66383 **Surface recombination velocity in a silicon optical waveguide.** M.Willander (Phys. Dept., Royal Inst. of Technol., Stockholm, Sweden).
Appl. Phys. A (Germany), vol.A31, no.1, p.45-9 (May 1983).
Measurements of the varying infrared absorption by free carriers in a silicon waveguide during intermittent electron bombardment are used to study the surface recombination velocity s. The same values for s are obtained for heat-treated and untreated samples, which supports the theory that electron beam irradiation in itself has a dehydrating effect. Other experiments show that s is not dependent on the energy of the impinging electrons in the range 16-23 keV. Finally, the temperature dependence of s in gold-doped silicon is estimated. If s is written in the form $s=s_0(293/T)^x$, x is found to be 2.1 ± 0.2 in the temperature interval $261K\leq T\leq 309K$. (18 refs.)

66384 **Investigation of the photoelastic effect in titanium-diffused optical waveguides in lithium niobate.** L.M.Andrushko, V.A.Voznesenskii.
Kvantovaya Elektron., Kiev (USSR), no.23, p.98-100 (1982). In Russian.
X-ray diffraction is employed to investigate the waveguide layers in $LiNbO_3$ produced by Ti-diffusion. The lattice parameters of $LiNbO_3$ are determined and the change of refractive index due to the photoelastic effect is considered. The obtained refractive index is compared with that at the surface alloyed with Ti and it is concluded that the contribution of the photoelastic effect during the formation of a waveguide by diffusion reaches 50%. (7 refs.)

66385 **Phenomena of the transformation of light polarization in multimode lightguides.** A.M.Bykov, A.V.Volyar, M.E.Kondakov, L.M.Kuchikyan.
Opt. & Spectrosc. (USA), vol.53, no.3, p.304-7 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.517-21 (Sept. 1982). [received: May 1983]
The effect of the method of exciting a multimode cylindrical lightguide with a rectangular refractive-index profile in its cross section on the polarization of the transmitted light is treated both experimentally and theoretically. It is shown that when polarized light is transmitted multimode lightguides can complete with single-mode lightguides. (11 refs.)

66386 **Radiant energy transmission along hollow-lens lightguides.** B.M.Lavrinovich.
Opt. & Spectrosc. (USA), vol.53, no.3, p.324-6 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.550-3 (Sept. 1982). [received: May 1983]
In several situations it is necessary to transmit intense light beams over large distances with a low loss. This is an urgent problem, for example, in solar-energy engineering, for the transmission of light beams from concentrators. The serious optical loss, the weight, and the cost are preventing the adoption of lens lightguides for transmitting intense light fluxes. Hollow-lens lightguides hold promise for this application. Such lightguides consist of positive annular toric or polyhedral (e.g. rectangular) cylindrical lenses. The area of the aperture in the annular lens or in a frame is many times larger than the area of the annular lens or frame lens itself. Such lightguides can have a rather large cross section and a high transmission, since they combine the advantages of hollow lightguides (a long mean free path of the ray from one side of the channel to the opposite side) and lens lightguides (low losses in the lenses). (6 refs.)

66387 **Mode energy transformation between two connected multimode general square-law-index optical waveguides.** S.G.Krivoshlykov, N.I.Petrov, I.N.Sissakian (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.193-207 (May 1983).
A coherent states method is used to investigate the mode coupling coefficients in the most general butt-joint problem for two multimode general square-law-index optical waveguides, when two different waveguides with elliptical cross-sections are to be butt-jointed with axis displacement, tilt and some turning of symmetry axes with respect to each other. The explicit expressions for the mode coupling coefficients and recurrence relations for the mode overlap integrals are obtained; the sum rules for the mode coupling coefficients are formulated and a method of experimental data analysis is proposed for this general problem. The method of calculating mode coupling coefficients is proposed for the case of the butt-joint problem when the waveguide cross-sections are only partially overlapping and then it is used to investigate the influence of misalignment on mode power distribution and pulse dispersion in the second waveguide. The experimental data are compared and it is shown that the coupling coefficients obtained in square-law-index model can be used in dispersion calculations for α-profile fibres in the case when the value α is not far from the value $\alpha=2$. (20 refs.)

66388 **Actively coupled index-guided lasers.** K.A.Shore (Dept. of Electrical Engng. & Electronics, Univ. of Liverpool, Liverpool, England).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.247-52 (May 1983).
An opto-electronic device is described in which two index-guided semiconductor lasers are actively coupled by means of a control injection current. The behaviour of the device under differing conditions of optical injection is examined. It is shown to be possible to find light-sensitive and light-insensitive configurations for device operation. The control current can be used to tune the sensitivity of the device. (12 refs.)

66389 **Elastooptic effect in a bent slab waveguide.** H.Marciniak (Inst. of Phys., Tech. Univ. of Warsaw, Warsaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.165-72 (1982).
The elastic strain imposed on the slab waveguide by physical deformation is shown to have a significant influence on wave propagation. Due to the existing stress, the dielectric medium changes into an anisotropic biaxial one. As a result the bending loss in the slab waveguide is reduced. (7 refs.)

66390 **Polarisation transformations of electromagnetic waves in multimode belt light guides.** A.M.Bykov, A.V.Volyar, L.M.Kuchukyan.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.450-2 (March 1983). In Russian.
Presents a theoretical calculation of the polarisation characteristics of light transmitted through belt light guides with small losses due to depolarisation and using the Jones-Muller formalism. On the basis of these calculations, a computer was used to formulate properties of multimode belt light guides for the transmission of linearly polarised light. It is shown that the degree of depolarisation of such light guides is minimal during the orientation of an electric vector perpendicular to one of the transverse cross-sections of the guide. (9 refs.) *V.G.P.*

66391 **Determination of irregular waveguide parameters.** A.D.Avdeev, T.N.Sagaidak.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.102-4 (Feb. 1983). In Russian.
A method of determining the width, surface impedance and refractive index in the irregular waveguide from waveguide equation coefficients is suggested. (2 refs.)

66392 Chromatic dispersion measurements in single-mode fibers using picosecond InGaAsP injection lasers in the 1.2- to 1.5-μm spectral region. C.Lin, A.R.Tynes, A.Tomita, P.L.Liu, D.L.Philen (Bell Labs., Murray Hill, NJ, USA).
Bell Syst. Tech. J. (USA), vol.62, no.2, pt.1, p.457-62 (Feb. 1983).
Describes the use of picosecond InGaAsP injection lasers for measuring chromatic dispersion in single-mode fibers in the 1.2-to 1.5-μm spectral region. Injection lasers at various wavelengths and a single-mode fiber-to-fiber switch are used in the pulse delay and pulse-broadening measurements. The simplicity and the compactness make the setup useful for field measurements and quality control. (11 refs.)

66393 Decreased losses in germanium-oxide glass optical fiber prepared by VAD method. H.Takahashi, I.Sugimoto (Central Res. Lab., Furukawa Electric Co., Ltd., Tokyo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L139-40 (March 1983).
A thick-clad germanium-oxide glass optical fiber doped with antimony has been prepared by the vapor-phase axial deposition (VAD) method. Loss values of less than 5 dB/km around 2 μm and 23 dB/km at 2.4 μm have been achieved. (2 refs.)

66394 Single polarization optical fibers. T.Katsuyama, H.Matsumura (Central Res. Lab., Hitachi Ltd., Kokubunji, Japan).
Hitachi Rev. (Japan), vol.31, no.6, p.331-4 (Dec. 1982). [received: April 1983]
Low loss single mode fibers that maintain polarization well have been developed. An extinction ratio of less than -30 dB at 1 km and a loss of 0.8 dB/km at 1.5 μm were achieved by concentric circular germanosilicate core-clad fibers with borosilicate elliptical jackets. These fibers are applicable to transmission lines of future coherent optical communication systems and are desirable for applications to integrated optical waveguide devices, as well as for other applications that depend upon the interactions of polarized light, such as laser gyros. (5 refs.)

66395 Raman investigation of the effects of torsion on fused silica optical fibers. M.S.Hokmabadi, G.E.Walrafen (Dept. of Chem., Howard Univ., Washington, DC, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5273-4 (15 April 1983).
The application of reversible tensile stress (3.3 GPa) to a pure fused silica optical fiber has been found to produce a significant modification of the Raman spectrum. Other Raman changes due to irreversible uniaxial compaction (9 GPa), and reversible hydrostatic compression (1 GPa), were uncovered recently. The present work constitutes a continuation of such studies in which Raman changes due to reversible torsion on a fused silica optical fiber (at constant load) are described and compared to new Raman results from irreversibly compacted fused silica. (11 refs.)

66396 Determination of parameters of circular optical fibers with a step profile in refractive index. S.M.Chernov, K.K.Zhilik, G.N.Petrovskii.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.839-43 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.137-42 (July 1982). [received: March 1983]
A method is described for investigating fibres which allows the determination of all the parameters in a single technique. The method is based on the recording and processing of the distribution of light intensity scattered by a stepwise fibre in a scan with a narrow light beam across the fibre. (5 refs.)

66397 Dispersion of tubular modes propagating in multimode optical fibres. A.Barthelemy (Lab. d'Optique, UER des Sci., Limoges, France).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.225-30 (May 1983).
The author has already used interferometric techniques for measuring, first, the impulse response of optical fibres and also the different times of flight of modes of a multimode fibre. Apart from time of flight, the author's set-up provides the intramodal dispersion of each mode $(d^2\beta/d\omega^2)$. To demonstrate this, the author has measured the modal dispersion difference between two tubular modes that were selectively excited in a multimode graded index fibre. For comparison, a theoretical expression has also been derived, based on a ray optics approach. (6 refs.)

66398 Fiber-optic diaphragm-curvature pressure transducer. C.M.Lawson, V.J.Tekippe (Electronics Lab., Gould Res. Center, Rolling Meadows, IL, USA).
Opt. Lett. (USA), vol.8, no.5, p.286-8 (May 1983).
A novel fiber-optic sensor that determines pressure from diaphragm curvature is discussed. This sensing technique exhibits a high degree of sensitivity and linearity and is less susceptible to environmental perturbations than previous intensity-modulating techniques. Experimental results are presented for a miniature pressure transducer suitable for in vivo medical applications. (9 refs.)

66399 Extreme picosecond pulse narrowing by means of soliton effect in single-mode optical fibres. L.F.Mollenauer, R.H.Stolen, J.P.Gordon (Bell Labs., Holmdel, NJ, USA), W.J.Tomlinson.
Opt. Lett. (USA), vol.8, no.5, p.289-91 (May 1983).
The authors report the narrowing of pulses, initially 7 psec FWHM, to widths as small as 0.26 psec by various lengths, short relative to the soliton period, of single-mode, low-loss optical fiber. Since the $\sim$1.5-μm wavelength lies in the region of negative group-velocity dispersion $(\partial v_g/\partial\lambda<0)$, no auxiliary dispersive element was required to complete the narrowing. Optimum compression was obtained for peak-pulse input powers of several hundred watts, corresponding to relatively high $(N<10)$ soliton number. The authors show these results to be in at least semiquantitative agreement with prediction based on the nonlinear Schrodinger equation. (10 refs.)

66400 Influence of the fibre diameter on the stress birefringence in high-birefringence fibres. S.C.Rashleigh, M.J.Marrone (Naval Res. Lab., Washington, DC, USA).
Opt. Lett. (USA), vol.8, no.5, p.292-4 (May 1983).
The influence of the outer diameter of the constraining region on the stress-induced birefringence in high-birefringences fibers is investigated for three fibre structures. Generally, the outer diameter should be three times larger than the mean diameter of the stress-producing regions to ensure that the birefringence is close to maximum. (14 refs.)

66401 The normalized cutoff frequencies of optical fibers with a parabolic variation of dielectric constant of the core. G.I.Gordon.
Radio Eng. & Electron. Phys. (USA), vol.27, no.6, p.9-16 (June 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.6, p.1066-73 (June 1982). [received: May 1983]
An expression is derived which allows determination of the normalized cutoff frequencies of linearly polarized modes and computation of total number of guided characteristic modes in an optical fiber with a quadratic variation of the dielectric constant of the core. (11 refs.)

66402 Optical fibre diagnostics using the backscattering method. J.Kanka, J.Hora (CASAV, Praha, Czechoslovakia).
Slaboproudy Obz. (Czechoslovakia), vol.44, no.3, p.105-11 (March 1983).
The backscattering method is described and its application possibilities are discussed with regard to the diagnostics of multimode optical fibres. After the method is analyzed theoretically, special attention is paid to the influence of fibre diameter fluctuation on backscattering. Moreover the procedure is stated for separating optical attenuation from the fluctuation of parameters of the filament using experimental data. Finally corroborative experiments are used to illustrate the problems of measuring attenuation and investigating the axial homogeneity in optical fibres using the backscatter method. (16 refs.)

66403 Increasing the numerical aperture of a glass-polymer light guide. I.V.Aleksandrov, S.Ya.Fel'd, O.E.Shushpanov (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1352-4 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2198-201 (Nov. 1982). [received: May 1983]
A light guide of the glass-polymer type with a thermoplastic cladding is considered. It is shown that the numerical aperture can be increased and the operating temperature range enlarged by suitably selecting the thermomechanical properties of the materials and the dimensions of the light guide. Equations are derived for choosing the light guide parameters and a numerical simulation is presented which illustrates the effectiveness of the cladding in improving light guide performance. (5 refs.)

66404 Phase modulation of coherent light in long multimode fiber light guides. O.I.Kotov, V.Yu.Petrun'kin, S.L.Sokolova, V.N.Filippov (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1354-6 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2202-6 (Nov. 1982). [received: May 1983]
The properties of coherent light passing through a multimode light guide are studied. The spatial and amplitude characteristics of a modulation signal produced by the mechanical disturbance of the wave guide are studied using a piezoelectric ceramic transducer. The experimental findings are in qualitative agreement with calculations based on the equations of geometric optics. (7 refs.)

66405 Phase modulation efficiency of coherent light in fiber light guides. O.I.Kotov, V.Yu.Petrun'kin, V.N.Filippov (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1357-8 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2207-9 (Nov. 1982). [received: May 1983]
Phase modulation in multimode light guides is studied theoretically for different detection and signal processing schemes with allowance for the mode structure of the output light. The results are compared with those for a single-mode light guide. (6 refs.)

66406 Matching of single-mode optical waveguides to semiconductor lasers. Yu.Kh.Ayunts, M.I.Belovolov, V.I.Borodulin, E.M.Dianov, S.A.Pashko, V.P.Filimonov, A.B.Tsibulya, V.I.Shveikin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1428-32 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2197-203 (Nov. 1982). [received: May 1983]
